INDEX OF CONTRIBUTORS

David Adams is professor of French Enlightenment studies at the University of Manchester (UK). He has published many articles and books on the literature and thought of the period, and is now working on the relationship between illustrated books and the society of the ancien régime.

Michael Adcock, an independent freethought historian and researcher, was formerly a Christian fundamentalist activist. He is currently working on a biography of Charles Chilton Moore, a notable regional freethought propagandist of the nineteenth century.

Norm R. Allen Jr. is deputy editor of *Free Inquiry* magazine and editor of *African American Humanism: An Anthology* and *The Black Humanist Experience: An Alternative to Religion.* He is the executive director of African Americans for Humanism (AAH), and has traveled throughout Africa, Europe, North America, and Latin America as a spokesperson for the Council for Secular Humanism.

W. Michael Ashcraft is an associate professor of religion at Truman State University. He is the author of *The Dawn of the New Cycle: Point Loma Theosophists and American Culture* (2002) and coeditor of *New Religious Movements: A Documentary Reader* (2005).

Hector Avalos is associate professor of religious studies and director of the US Latino/a Studies program at Iowa State University. The author of six books and numerous articles, Avalos received his BA in anthropology from the University of Arizona and a PhD in biblical and Near Eastern studies from Harvard.

A. J. (Jim) Baker taught philosophy for many years at Australia's Sydney, Waikato, and Macquarie universities. In Sydney, he was a student of John Anderson and later a colleague of both he and John Mackie. He was also a leading member of the Libertarian Society and the radical bohemian "Sydney Push."

William Baker is presidential research professor at the Department of English and University Libraries, Northern Illinois University. He edits *George Eliot–George Henry Lewes Studies.* His coauthored *George Eliot: A Bibliographical History* was published by Oak Knoll/British Library in 2002.

Joe Edward Barnhart is professor of philosophy and religion studies at the University of North Texas. He has published in leading journals and is author of *The Study of Religion and Its Meaning: New Explorations in Light of Karl Popper and Emile Durkheim, Religion and the Challenge of Philosophy, The Billy Graham Religion,* and other books.

Lawrence I. Berkove is emeritus professor of English at the University of Michigan–Dearborn. Among his frequent publications on Twain is Modern Library's edition of the *Best Short Stories of Mark Twain* (2004). He is presently writing a book on Twain's religion and is current president of the Mark Twain Circle of America.

David Berman is an associate professor of philosophy and a fellow of Trinity College, Dublin, where he has been teaching since 1968. He is author of *A History of Atheism in Britain* (Routledge, 1990), *George Berkeley: Idealism and the Man* (Oxford, 1996), *Berkeley: Experimental Philosophy* (Phoenix, 1997), and *Berkeley and Irish Philosophy* (Continuum, 2005).

Ray Billington was a Methodist minister until 1971, when he was expelled for heresy over his book *The Christian Outsider.* A relative rarity, a living officially declared heretic, he rose to be head of philosophy at the University of the West of England. Since retirement he teaches at Oxford and Bath.

Timothy Binga, director of the Center for Inquiry Libraries, received his MLS in 1995, and is a member of the American Library Association and the New York Library Association. His original cataloging of many rare freethought works held nowhere else but at the Center for Inquiry led to his article "Preserving Our Freethought Heritage Redux" (*Free Inquiry*, Spring 2003).

Rebecca Bizonet, MSI, is an archivist at the University of Michigan Special Collections Library, where she arranges and describes collections of manuscripts, personal papers, and organizational records ranging from a trove of poet A. C. Swinburne's manuscripts and letters to anarchist papers from the renowned Labadie Collection of social protest materials.

Dan Bollinger is executive director of the International Coalition for Genital Integrity (Santa Cruz, CA). He is a men's issues researcher and instructor for men's personal growth workshops.

Robert Boston is the assistant director of communications for Americans United for Separation of Church and State in Washington, DC. He is the author of three books

on church-state separation, including *Why the Religious Right Is Wrong about Separation of Church & State* (second edition, 2003).

Roderick Bradford is the author of a 2006 biography, *D. M. Bennett: The Truth Seeker*, a life of the founder of America's longest continually published freethought publication. He is a documentary video producer and writer whose articles have appeared in *American History* magazine, *American Atheist, The Truth Seeker*, and *The Quest*, the official journal of the Theosophical Society in America.

Graham Bradshaw is professor of English at Chuo University, Japan. He is senior editor of the Shakespearean International Yearbook and the author of *Shakespeare's Scepticism* and *Misrepresentations: Shakespeare and the Materialists.* His most recent book, written with Tetsuo Kishi, is a study of Shakespeare in Japan.

Paul Sydney Braterman moved in 1988 from a readership at Glasgow University to the University of North Texas, where he is a regents professor of chemistry. He has published over 120 scientific publications, and is a member of the editorial board of *Origins of Life and Evolution of Biospheres.*

Emeritus Professor Anthony Briggs, a senior research fellow at Bristol University, has written widely on Russian literature and English poetry, including several books and articles on Alexander Pushkin and some verse translations. His new translation of Tolstoy's *War and Peace* was published recently by Penguin Books (UK) and Viking (USA).

Gary Brill is an instructor in psychology at Rutgers, the State University of New Jersey. He is a longtime humanist and one of the original members of the HumanLight Committee.

George Broadhead is a founding member of the Gay and Lesbian Humanist Association (GALHA), based in the UK, and has been its voluntary administrator almost since its founding in 1977.

Ed Buckner leads the Atlanta Freethought Society and was formerly executive director of the Council for Secular Humanism. He coedited with his son Michael E. Buckner *Quotations That Support the Separation of Church and State* (1995) and contributed the concluding chapter to *Fundamentals of Extremism: The Christian Right in America*, ed. Kimberly Blaker (2003).

Vern L. Bullough, PhD, DSci, RN, was a former co-president of the International Humanist and Ethical Union (IHEU) and one of the founders of the Council for Secular Humanism. He was author or editor of more than fifty books and was a State University of New York distinguished professor emeritus. A longtime activist in the struggle for civil rights and civil liberties, much of his later research concentrated on sex and gender issues.

David Bumbaugh, minister emeritus of the Unitarian Church in Summit, New Jersey, is president of the Unitarian Universalist Historical Society and professor of ministry at Meadville Lombard. He is the author of two books: *The Education of God* and *Unitarian Universalism: A Narrative History.*

Kenneth W. Burchell is president of the Thomas Paine Institute and a past association historian and trustee of the Thomas Paine National Historical Association. A professional appraiser of fine gems, jewelry, and antiquarian books, he devotes his personal time to research and writing on American reform and freethought.

Bruce E. Cathey is an independent scholar writing two large-scale freethought bibliographies. He has visited dozens of national and university research libraries, public and special libraries, rare book collections, and freethought libraries in six countries and on three continents. He is also an acquisitions consultant to the Center for Inquiry Libraries (Amherst, New York).

Virginia Clark was reference librarian at Kenyon College (Ohio) and editor of the journal *Choice.* She spent much of her widowed retirement in London, volunteering at the Women's Library and the Conway Hall Humanist Centre. She completed research for her entry in this work one week before her sudden death.

William Raymond Clark received his PhD from the University of California–Berkeley. He is professor emeritus of French at Salem State College (Massachusetts). He has written on the unbelief of Stendhal, Mérimée, Clemenceau, and Littré.

Edmund D. Cohen is the author of *The Mind of the Bible-Believer*, *C. G. Jung and the Scientific Attitude*, and many articles. He is an attorney and a PhD psychologist. He was a pioneer in the videotaping of Religious Right leaders' television broadcasts, using their own recorded utterances to discredit them.

Heather J. Coleman is associate professor and Canada research chair in imperial Russian history in the department of history and classics at the University of Alberta, Edmonton, Canada. She is the author of *Russian Baptists and Spiritual Revolution, 1905–1929* (Indiana, 2005).

Bill Cooke is senior lecturer at the School of Visual Arts, University of Auckland at Manukau (New Zealand), visiting assistant professor of philosophy at the University of Buffalo (2003–2006), and a fellow of the Committee for the Scientific Examination of Religion.

Robert M. Cutler is senior research fellow at the Institute of European and Russian Studies, Carleton University (Canada). He is translator and editor of the acclaimed anthology *The Basic Bakunin* (Prometheus Books, 1992) as well as a number of articles on Bakunin's life and thought. He also maintains a Bakunin-oriented Web site.

Austin Dacey is vice president and United Nations representative of the Center for Inquiry. He is executive editor of *Philo*, the journal of the Society of Humanist Philosophers, and was an associate editor of *Free Inquiry* magazine.

Sarah Darby is a PhD candidate in the philosophy department at Stanford University. She is writing a dissertation about Nietzsche's analysis of the relationship between authority and value in Christianity and how he thought that relationship would be transformed in the process of creating new values.

Richard Dawkins is Charles Simonyi professor of the public understanding of science at Oxford University. His books, *The Selfish Gene*, *The Extended Phenotype*, *The Blind Watchmaker*, *River Out of Eden*, *Climbing Mount Improbable*, *Unweaving the Rainbow*, *A Devil's Chaplain*, and *The Ancestor's Tale*, many of them bestsellers, have earned him the humorously Huxleyan accolade of "Darwin's Rottweiler." His 2006 *The God Delusion* became a major bestseller. His most valuable prizes are the International Cosmos Prize (Japan) and the Kistler Prize (US). He holds honorary degrees in literature as well as science and is a fellow of the Royal Society as well as of the Royal Society of Literature.

Kathleen De Grave is a professor of American literature and codirector of creative writing at Pittsburg State University. Her publications include *Swindler, Spy, Rebel: The Confidence Woman in 19th-Century America* and *Company Woman*, a novel. She also wrote the introduction to the recent unexpurgated edition of Upton Sinclair's *The Jungle*.

Tim Delaney is a social theorist who teaches sociology courses at the State University of New York at Oswego. He has published seven books including *Classical Social Theory: Investigation and Application* and *Contemporary Social Theory: Investigation and Application.* He regularly presents papers at regional, national, and international conferences.

Hans van Deukeren is a science and historical writer. He served as office manager at the Humanist Archives in the Netherlands (1998–2005) and has published a history of the International Humanist and Ethical Union (2002).

Christopher W. diCarlo is lecturer in philosophy at the University of Ontario Institute of Technology. He has spoken and written on topics from bioethics to cognitive evolution. A past visiting research scholar at Harvard University, his forthcoming book is *How to Become a Really Good Pain in the Ass: A Practical Guide to Thinking Critically.*

Edd Doerr, president of Americans for Religious Liberty and immediate past president of the American Humanist Association, is the author, coauthor, editor, or translator of twenty-five books on church-state issues, fiction, and poetry. He has also authored over two thousand published articles, reviews, and letters and has served on the boards of NARAL, the Maryland ACLU, and other organizations.

George Donaldson is lecturer in English and deputy head of the department of English at the University of Bristol. He has teaching and research interests in Shakespeare, Shelley, and Lawrence; eighteenth-, nineteenth-, and twentieth-century novel, poetry, and literary criticism; and Freud, psychoanalysis, and literature. He has published on Shelley and Lawrence.

Theodore Drange is professor emeritus of philosophy at West Virginia University and is the author of *Type Crossings: Sentential Meaninglessness in the Border Area of Linguistics and Philosophy* (1966) and *Nonbelief and Evil: Two Arguments for the Nonexistence of God* (1998). Several of his essays and debates appear on the Internet.

Dan Dugan is known in audio engineering as the inventor of the automatic microphone mixer. His equipment is used in churches, courtrooms, conferences, and television shows. In addition to engineering, Dugan has a lively interest in the philosophy of science and current controversies about scientific paradigms and alternative medicine.

Sanal Edamaruku is president of the Indian Rationalist Association and of Rationalist International. He edits Rationalist International's Internet publication that appears in English, French, German, Spanish, and Finnish. He has convened three international rationalist conferences (1995, 2000, and 2002) and is a well-known campaigner against superstitions and obscurantism.

Taner Edis is associate professor of physics at Truman State University, author of *The Ghost in the Universe* (Prometheus Books, 2002), and coeditor of *Why Intelligent Design Fails* (Rutgers University Press, 2004). His recent books include *Science and Nonbelief* (2005) and *An Illusion of Harmony: Science and Religion in Islam* (2007). He is an active critic of supernatural and paranormal claims.

Fred Edwords was formerly editor of *The Humanist* magazine and executive director of the American Humanist

Association (AHA). He has been recognized as Rationalist of the Year by the American Rationalist Federation and as a Humanist Pioneer by the AHA. His start in freethought included working for the fourth publisher of *The Truth Seeker*, James Hervey Johnson, which gave him access to records now scattered or destroyed.

Allen Esterson is a former lecturer at Southwark College, London, and author of *Seductive Mirage: An Exploration of the Work of Sigmund Freud* (1993) and varied articles on Freud and the history of psychoanalysis.

Yolanda Estes is professor of philosophy at Mississippi State University. She specializes in ethics and German idealism, particularly J. G. Fichte's philosophy. Her publications include *Marginal Groups and Mainstream American Culture* (University Press of Kansas) and *J. G. Fichte and the Atheism Dispute, 1798–1800* (Ashgate Publishing Company).

Charlotte Eulette, national director of the Celebrant USA Foundation and Institute, hails from Oak Park, Illinois. For twenty years an executive in high technology companies and Internet advertising firms, her life changed in 2001 when, together with her partner Gaile Sarma, she brought Celebrancy to the US and started the Celebrant USA Foundation—the US arm of a worldwide phenomenon in secular ceremonies that began thirty years ago and has flourished throughout North America.

Wayne Facer cofounded the University of Auckland (New Zealand) Humanist Society and was its chairman from 1965 to 1970. He has made media appearances and participated in social reforms concerning family planning and abortion. He currently researches New Zealand Unitarian and freethought history. He belongs to the New Zealand Association of Rationalists and Humanists.

Grace Farrell, Rebecca Clifton Reade professor at Butler University, publishes on American fiction. Her books include *From Exile to Redemption: The Fiction of Isaac Bashevis Singer*, *Isaac Bashevis Singer: Literary Conversations*, *Critical Essays on Isaac Bashevis Singer*, the recovered edition of Blake's *Fettered for Life*, and *Lillie Devereux Blake: Retracing a Life Erased.*

Jose Manuel Fernandez Santana earned his law degree from the University of Buenos Aires. He organized the First International Exhibition of Literature for Nonbelievers (Stockholm-Oslo) and founded the Humanist and Ethical Union of Sweden. The Argentine Society of Writers (SADE) named his book *Miramar Memories* as the best biographical book of 1999.

Carlos Fiolhais is professor of physics and director of the general library at the University of Coimbra in Coimbra, Portugal. He has authored several books including *A coisa mais preciosa que temos* (*Our Most Precious Thing*) and has received a national prize for scientific excellence.

Antony Flew was born in London and educated in Kingswood School, Bath, and Oxford University, where he earned a First Class degree as well as the university prize in philosophy. Married, he has two daughters and one granddaughter. He has held various professorial appointments in England and North America and has written twenty-six books and edited twelve anthologies.

Ronald B. Flowers is John F. Weatherly emeritus professor of religion at Texas Christian University, Fort Worth. He is the author of *That Godless Court? Supreme Court Decisions on Church-State Relationships* (second edition, 2005). He has served as president of the American Academy of Religion/Southwest and is a member of the editorial council of the *Journal of Church and State.*

J. M. Floyd-Thomas teaches US and African American history at Texas Christian University (Fort Worth) and is working on a book about Rev. Ethelred Brown's life and career titled *Creating a Temple and a Forum: Religion, Culture, and Politics in the Harlem Unitarian Church, 1920–1956.*

Tom Flynn is editor of the *New Encyclopedia of Unbelief*; editor of *Free Inquiry*, the world's largest-circulation English-language secular humanist magazine; and designer and director of the Robert Green Ingersoll Birthplace Museum, America's only freethought museum. He is author of *The Trouble with Christmas* (1993) and two irreverent science fiction novels, *Galactic Rapture* (2000) and *Nothing Sacred* (2004). His antireligious short play best known as *Messiah Game* enjoyed several productions, including an off-off-off-Broadway debut in 2002. A video producer and a student of visual effects and photographic deception, Flynn has performed photo/video analysis in numerous television programs and has written on photography and the paranormal in Gordon Stein's *Encyclopedia of the Paranormal* (1996).

Joe Fox is an activist involved with many humanist, freethought, skeptical, and civic/political activist groups. He is currently vice president of the New Jersey Humanist Network and serves on the boards of other humanist groups. He is also cocreator of HumanLight, a new December humanist holiday.

Kendrick Frazier is editor of *Skeptical Inquirer*, the Magazine for Science and Reason. He is editor of five anthologies, including *Science Confronts the Paranormal* and *Encounters with the Paranormal: Science, Knowledge, and Belief.* He is also a science writer with interests in astronomy, space exploration, and the philosophy of science.

Andrea Frova is presently full professor of physics at the University of Rome "La Sapienza." He has been a research scientist at AT&T Bell Labs and a visiting professor at the Universities of Illinois, Stuttgart, California, and Polytechnic of Lausanne. He has authored more than one hundred fifty scientific papers, two hundred popular articles, and numerous books, including (with Mariapiera Marenzana) *Thus Spoke Galileo* (2006).

Mark Furner's curiosity for history and subversive ideas led him to study Switzerland's religious underground and turned him from mild agnostic to atheist. Since the late 1990s he has belonged to the Swiss Freethinkers Society (FVS) and its national committee, where he assists Jean Kaech in international affairs.

James Garvey teaches philosophy at the University of Nottingham, England, and is secretary of the Royal Institute of Philosophy. He has published papers and reviews on metaphysics and epistemology.

Bert Gasenbeek is director of the Humanist Archives and of the Library of the University for Humanistics in Utrecht, the Netherlands. He has been research fellow for history and theory of humanism since 2002. His main field of interest is the history of the humanist movement in the Netherlands.

Annie Laurie Gaylor is copresident of the Freedom From Religion Foundation and editor of its newspaper, *Freethought Today*, as well as the anthology of women freethinkers, *Women without Superstition: No Gods—No Masters* (1997). She is also author of *Woe to the Women—The Bible Tells Me So* (1981, revised 2004).

Elizabeth M. Gerber is a regional freethought activist and an amateur archivist of freethought history. British-born, she has lived in Kansas City, Missouri, since 1976. Her special research interest concerns women in freethought history; she is currently compiling a biographical dictionary of nineteenth-century women freethinkers.

Lloyd Gerson is professor of philosophy at the University of Toronto. His works on ancient philosophy include *Knowing Persons: A Study in Plato*, *Neoplatonic Philosophy: Introductory Readings* (with John Dillon), and *Aristotle and Other Platonists*. His translations of Sextus Empiricus can be found in *Hellenistic Philosophy: Introductory Readings* (with Brad Inwood).

Lawrence B. Goodheart is professor of history at the University of Connecticut. He is the author of *Abolitionist, Actuary, Atheist: Elizur Wright and the Reform Impulse* (1990). Most recently, he has coedited *Murder on Trial* (2005) and is now working on a manuscript titled "The Death Penalty in Connecticut, 1636–2005."

A. C. Grayling is professor of philosophy at the University of London and an honorary associate of the British Humanist Association.

Karen Green is an associate professor at Monash University (Australia) where she teaches existentialism, philosophy of language, and history of women's ideas. Her publications include *The Woman of Reason: Feminism, Humanism, and Political Thought* (1995), *Dummett: Philosophy of Language* (2001), and, with Constant J. Mews, *Healing the Body Politic: The Political Thought of Christine de Pizan* (2005).

Jason Grinnell received his PhD in philosophy from Bowling Green State University. He has taught at Adrian College (Michigan) and has served as a visiting assistant professor at the University of Toledo (Ohio). His research interests include ancient philosophy, social philosophy, and the philosophy of biology.

Philippe Jean Florencio Grollet is a barrister in Brussels, Belgium. Since 1977 he has been a trustee of the *Centre d'action laïque*. He was president of "*Brussels laïque*" (1980–86) and has been president of *Centre d'action laïque* since 1988. He is author of *Laïcite, Utopia, and Necessity* (Brussels, 2005).

Horst Groschopp has studied the history of labor culture, German freethought, and modern humanism. For twenty-five years a lecturer at Berlin's Humboldt University, since 2000 he has been an associate of the Institute for Humanist Life in Berlin, director of the Humanist Academy, and editor of the magazine *Humanismus Aktuell* (Humanism Today). Since 2003 he has been one of the national leaders of the HVD (Humanist Federation of Germany).

Melinda Grube, a doctoral candidate at the Union Institute and University, teaches history at Cayuga Community College in Auburn, New York.

Stewart Elliott Guthrie is emeritus professor of anthropology at Fordham University. His research, which began with fieldwork in Japan, centers on anthropomorphism and religion. It approaches these as by-products of a perceptual strategy for an ambiguous world. That strategy is: Look first for what matters most.

Brean Hammond is professor of modern English literature at the University of Nottingham. He is the author of *Bolingbroke and Pope: A Study in Friendship and Influence* (1983), which considers the question of deism in the two authors.

Glenn Hardie was a founding member of the British Columbia (Canada) Humanist Association. Holding degrees in philosophy and education and diplomas in

construction economics and property appraisal, he has published three books on building technology and one titled *The Essence of Humanism.* He and his wife of forty years, Lorraine, live in Vancouver.

Peter H. Hare taught at the University at Buffalo until his retirement as SUNY distinguished service professor of philosophy. He is author, coauthor, or editor of several books in the history of American philosophy, philosophy of religion, epistemology, and metaphilosophy. For more than thirty years he has coedited *Transactions of the C. S. Peirce Society.*

Erkki Hartikainen, a teacher, introduced the subject "View of Life" (worldview, lifestance) in Finland's schools. He is a past secretary-general and current chair of the Union of Freethinkers of Finland and chair of the Atheist Association of Finland. He is editor-in-chief of the magazine *Vapaa Ajattelija* (Free Thinker).

Van A. Harvey is an emeritus professor of religious studies at Stanford University. After serving in the US Navy during World War II, he earned his PhD at Yale University. Twice a John Simon Guggenheim fellow, he is the author of *A Handbook of Theological Terms*, *The Historian and the Believer*, and the award-winning *Feuerbach and the Interpretation of Religion.* He is a fellow of the Committee for the Scientific Examination of Religion's Jesus Project.

Robert P. Helms is an independent historian, presently writing a book on the early anarchists of Philadelphia. He edited and was the principal author of *Guinea Pig Zero: An Anthology of the Journal for Human Research Subjects* (New Orleans, 2002), has published many articles on anarchism, and edited and annotated the forthcoming translation of anarchist Chaim L. Weinberg's 1930 Yiddish memoirs.

Julie Herrada is curator of the Labadie Collection, part of the Special Collections Library at the University of Michigan, where she has worked since 1994. The Labadie Collection is one of the top research libraries in the world on topics relating to radical social protest. Herrada holds an MLS with a certificate in archival administration from Wayne State University.

Jim Herrick is the former editor of *The Freethinker*, *International Humanist News*, and *The New Humanist.* He is author of *Vision and Realism: A Hundred Years of* The Freethinker (1982), *Against the Faith: Some Deists, Sceptics and Atheists* (1985), and *Humanism: An Introduction* (2003).

Alberto Hidalgo Tuñón, Spanish materialist philosopher, was president of the *Sociedad Asturiana de Filosofía* (1981–2000) and is a laureate of the International Academy of Humanism. Author of over three hundred articles and eleven books, his high school textbook *Symploké* (Jucar, 1987) was censored; in 2003 he was denied a philosophy professorship at La Coruña University by an Opus Dei veto.

Finngeir Hiorth was born in Indonesia. His Norwegian parents were Salvation Army missionaries, but he ceased believing in God at age nineteen. He was lecturer, then senior lecturer, in philosophy at the University of Oslo from 1963 to 1993. His books deal with linguistics, freethought, humanism, atheism, materialism, rationalism, metaphysics, Marxism, and ethics.

Christopher Hitchens is columnist and contributing editor at *Vanity Fair*, visiting professor at the New School for Social Research, and columnist at *Free Inquiry.* His books include *Thomas Jefferson: Author of America* (2005); *Thomas Paine's* Rights of Man: *Books That Changed the World,* and a best-selling critique of religion titled *God Is Not Great: How Religion Poisons Everything* (2007).

R. Joseph Hoffmann is senior vice ppresident for academic affairs at the Center for Inquiry, chair of the Center for Inquiry's Committee for the Scientific Examination of Religion (CSER), and director of CSER's Jesus Project. Prior to that he was Campbell professor and chair of the department of religion at Wells College, New York. He taught at the University of Michigan, Oxford, and the American University of Beirut, and was a Fulbright exchange scholar in Malawi and Zimbabwe. A specialist in the social and intellectual history of early Christianity, he has published, among his other writings, reconstructions of the writings of Celsus (1987), Porphyry (1996), and Julian the Apostate (2004).

Aaron Holland teaches logic and philosophy at Mesa Community College in Mesa, Arizona.

Ted Honderich, Great Britain's outstanding progressive philosopher, was recently interviewed for *CounterPunch* by Paul de Rooij. One of his past books is titled *Punishment, the Supposed Justifications.* Another is the funny and deadly examination of a political tradition, *Conservatism*, and a third is titled *Violence for Equality: Inquiries in Political Philosophy.* His new book is *After the Terror* (Edinburgh University Press, Columbia University Press).

Lawrence Westerby Howe is associate professor of philosophy at the University of West Florida. Aside from numerous publications on Bergson, he has also published papers in environmental ethics, the history of philosophy, and the philosophy of time.

Wesley V. Hromatko holds degrees from the University of Minnesota and Meadville/Lombard. Admitted to the

Unitarian Universalist Ministerial Fellowship, he belongs to the Collegium of the Unitarian Universalist Ministers' Association and the Unitarian Universalist Historical Society (UUHS). His publications include articles and contributions to the UUHS Biographical Dictionary.

Richard T. Hull is professor emeritus of philosophy at the State University of New York at Buffalo. He has held visiting positions at Tarleton State University, Texas State University, and the University of Montana, and he has served on various hospital ethics committees. He has published extensively on issues in bioethics.

Inge Hüsgen studies German and English language and literature. She has worked at the Heinrich-Heine-Insititut, Düsseldorf, and is now editor of the German magazine *Skeptiker*. She has contributed journalistic articles to various papers and magazines.

Innaiah Narisetti is director of the Center for Inquiry, India. He has taught philosophy of science at Osmania University (India) and written books and articles on humanism and child abuse by religions in English and Telugu. An active participant in the humanist movement, he has translated books by Paul Kurtz, M. N. Roy, A. B. Shah, Agehananda Bharati, V. B. Karnik, Shib Narayan Ray, and Ibn Warraq into Telugu.

Susan Jacoby is the author of *Freethinkers: A History of American Secularism* (2004) and seven other books, including *Half-Jew: A Daughter's Search for Her Family's Buried Past* and *Wild Justice: The Evolution of Revenge*. She is a frequent contributor to magazines and newspapers.

S. T. Joshi is the author of *God's Defenders: What They Believe and Why They Are Wrong* (2003) and the editor of *Atheism: A Reader* (2000) and *H. L. Mencken on Religion* (2002). He has also written *The Weird Tale* (1990), *H. P. Lovecraft: A Life* (1996), and other critical and biographical studies.

Jean Kaech joined the Swiss Freethinkers Society (FVS) in 1951. He has held various offices on FVS's local committee, including section president. Since 1969 he has served FVS's national committee, for several years, as copresident. Since 1979 he has served on the board of the World Union of Freethinkers.

Bernard Katz was a contributing editor of *The American Rationalist* from 1982 until 2006. He is author of *A Different Point of View: Debunking Religion, The Ways of an Atheist*, and *Superstocks*.

David Kelley is founder and senior fellow of the Objectivist Center and author of many articles and books in theoretical philosophy, social issues, and public policy. His works include *The Art of Reasoning*, a widely used logic textbook, and *The Contested Legacy of Ayn Rand: Truth and Toleration in Objectivism*.

Robert Kirk is emeritus professor of philosophy at the University of Nottingham. He has published widely on topics in the philosophy of mind and the philosophy of language, including the books *Translation Determined* (1986), *Raw Feeling* (1994), *Relativism and Reality* (1999), and *Mind and Body* (2003).

Barry Klassel holds degrees in psychology and theater and has been a Certified Celebrant (Celebrant USA) since 2003. An actor and theater director, he advocates greater prominence for the arts in humanism because the arts explore the full range of human experience and are a springboard for examining dynamic themes of human life.

David Koepsell is executive director of the Council for Secular Humanism. He earned a law degree and a doctorate in philosophy at the State University of New York at Buffalo. His publications include articles in scholarly journals and the books *The Ontology of Cyberspace* and *Searle on the Institutions of Social Reality*, which he coedited with Laurence Moss.

Carol Kolmerten is professor of English at Hood College, Frederick, Maryland, where she has taught for twenty-seven years. Her books include *Women in Utopia: The Ideology of Gender in the American Owenite Communties* (1990) and *The American Life of Ernestine L. Rose* (1999).

Paul Kurtz is professor emeritus of philosophy at the State University of New York at Buffalo, founder and chair of the Committee for Skeptical Inquiry (formerly CSICOP) and the Council for Secular Humanism, and editor-in-chief of *Free Inquiry* magazine. He is author or editor of forty-eight books and eight hundred articles. He is also founder and chair of the Center for Inquiry/Transnational, founder and chair of Prometheus Books, a fellow of the American Association for the Advancement of Science, a past copresident of the International Humanist and Ethical Union, and president of the International Academy of Humanism.

Alan Lacey was born in Birmingham in 1926 and studied at Cambridge from 1946 to 1952. After two years at Manchester, he lectured in London at Bedford College (1954–84) and King's College (1984–91). His main publications are a dictionary of philosophy and books on Bergson and Nozick.

John Lachs is centennial professor of philosophy at Vanderbilt University. He received bachelor's and master's degrees from McGill University, and a PhD from Yale.

His books include *A Community of Individuals* (2003) and *On Santayana* (2005).

Roberto La Ferla, a physical chemist by training, works in basic and applied science research. He served for several years as secretary of the "Giordano Bruno" Italian National Freethought Association and as coeditor of its publications *La Nuova Ragione* and *Libero Pensiero.* He is a member of the executive board of the World Union of Freethinkers (Paris).

Ann J. Lane is professor of history and women and gender studies at the University of Virginia. She has previously taught at Rutgers University, Sarah Lawrence College, and elsewhere. She has written a biography of Charlotte Perkins Gilman and edited and published Gilman's feminist utopian novel *Herland* and *The Charlotte Perkins Gilman Reader.*

Lavanam (Goparaju) is director of the Atheist Centre in Vijayawada, India, which was founded by Gora in 1940. He has participated in the Indian freedom movement, the post-Gandhian movement, and Sarvodaya. He also chairs Samskar, an organization for social and criminal reform. He has traveled as an atheist goodwill ambassador worldwide. Coeditor of the Atheist Centre's English-language monthly *Atheist*, he has published ten books and five hundred articles on atheism, humanism, Gandhism, and social change.

Earl Lee is a librarian at Pittsburg State University (Kansas) and has written for *The Humanist* and *The Truth Seeker*. His books include *Libraries in the Age of Mediocrity* and parodies of the fundamentalist *Left Behind* series, including *Kiss My Left Behind* and *Kiss My Left Behind 2: The Tribulation Farce.*

Michel Le Normand is professor emeritus of botany at the National Higher Agronomic School of Rennes, France. He served for three years as president of the Rennes freethought group *Association Joseph Turmel.* In December 2003, the association organized a memorial colloquium to mark the sixtieth anniversary of Turmel's death. He serves as the chief editor of Turmel's collected works.

Neil Levy is a research fellow at the Centre for Applied Philosophy and Public Ethics, University of Melbourne. He is the author of four books, including *Sartre* (2002) and *What Makes Us Moral* (2004), as well as many articles in all areas of philosophy.

Alison M. Lewis is the humanities/social sciences librarian at Drexel University. Her research interests have focused on the intersection of modernism and mystical beliefs, particularly in the works of D. H. Lawrence and Virginia Woolf.

Terry Liddle writes and lectures on radical history including freethought history. He is secretary of the Freethought History Research Group and a member of the National Secular Society, South Place Ethical Society, and the Thomas Paine Society. He is author of *Deptford's Red Republican*, a biography of the Chartist George Harney.

Georges C. Liénard was born in Brussels, Belgium. A PhD in chemistry, he spent his career doing fundamental research in heterogeneous catalysis. Between 1975 and 1983 he was president of *Centre d'action laïque*, a Belgian humanist umbrella association. Since 2000 he has been general secretary of the European Humanist Federation.

Ronald A. Lindsay is legal director of the Center for Inquiry / Office of Public Policy in Washington, DC. By training both a philosopher and a lawyer, he has published articles on bioethics, the philosophy of religion, and constitutional law in various publications, including the *Kennedy Institute of Ethics Journal*, the *Journal of Law, Medicine, & Ethics*, and *Free Inquiry.*

James C. Livingston is professor emeritus of religion at the College of William and Mary, where he was the founding head of the department of religion. He is the author of nine books and a fellow of the American Council of Learned Societies, the National Endowment for the Humanities, the Woodrow Wilson International Center for Scholars, and Clare Hall, Cambridge University.

Jeannette Lowen, a student of human behavior, worked as a social worker and educator and in retirement discovered the study of philosophy. She has had articles published in *Free Inquiry* and two books critically acclaimed by anthropologist Ashley Montagu. Lowen continues writing and lecturing for a humanistic social psychology.

John M. Lynch is a lecturer at Arizona State University, where he is affiliated with the Center for Biology and Society and the history and philosophy of science program. He currently researches Catholic reactions to evolution and is the editor of the *Dictionary of Evolutionary Thought* (2007).

Sherrie Lyons teaches at Empire State College. She received her PhD at the University of Chicago and is the author of *Thomas Henry Huxley: The Evolution of a Scientist* (1999). Her current research examines three cases of marginal science in the Victorian period to explore issues of scientific marginality and legitimacy.

Tibor R. Machan is the R. C. Hoiles professor of business ethics at Chapman University in Orange, California.

He is research fellow at the Hoover Institution and advises Freedom Communications, Inc., on libertarian issues.

Timothy J. Madigan teaches philosophy at St. John Fisher College and was editorial director of the University of Rochester Press from 1999 to 2004. Lois N. Magner, professor emerita at Purdue University, taught courses in the history of medicine and life sciences. Her publications include *A History of the Life Sciences* (third edition, 2002), *A History of Medicine* (second edition, 2005), and *Doctors, Nurses, and Medical Practitioners: A Bio-Bibliographical Sourcebook* (1997).

Mariapiera Marenzana graduated from the University of Pavia and undertook advanced study in psychology at the Universities of Illinois and California. Now retired, she was for decades a teacher in Italian senior high schools. She has written freelance articles in Italian cultural magazines and coauthored with Andrea Frova the book *Thus Spoke Galileo* (2006).

Kenneth Marsalek is a founding member and past president of the Washington Area Secular Humanists and a former board member of the Council for Secular Humanism. He has written on the humanism of *Star Trek* creator Gene Roddenberry in *Free Inquiry* magazine.

Michael Martin is professor of philosophy emeritus, Boston University, author of *Atheism: A Philosophical Justification*, *The Case Against Christianity*, *The Big Domino in the Sky*, and *Atheism, Morality, and Meaning*. He is coeditor with Ricki Monnier of *The Impossibility of God* and editor of the *Cambridge Companion to Atheism*.

James McCollum, the son of Vashti Cromwell McCollum, is retired from a thirty-four-year law practice but currently works as a computer specialist and instructor at Southern Arkansas University. He is active with Americans United for Separation of Church and State and the South West Unitarian Universalist Conference.

Wendy McElroy is the editor of ifeminists.com, a weekly columnist for Fox News, and a research fellow for the Independent Institute in Oakland, California. She is author and editor of many books and articles, including *Liberty for Women: Freedom and Feminism in the 21st Century* (2002).

Mario Mendez-Acosta is a science writer, journalist, and civil engineer. He heads the Mexican Skeptical Research Society. He is a columnist for *Ciencia y Desarrollo*, the journal of the Mexican government science agency, and heads the Journalist's Club of Mexico City. He has authored several books on science and skepticism.

James Moore is a historian of science at the Open University in England. He has taught at Cambridge, Harvard, Notre Dame, and McMaster universities. His books include *The Post-Darwinian Controversies* (1979), *The Darwin Legend* (1994), and with Adrian Desmond the best-selling biography *Darwin* (1991). Moore is working on a biography of Alfred Russel Wallace.

Robert W. Morrell, MBE, is a retired local government officer and founder, in 1963, of the Thomas Paine Society. He has published many articles on freethought history and Paine studies. Editor of the *Journal of Radical History*, he wrote a short biography of former NSS president F. A. Ridley and the only English-language biography of Egyptologist Sir E. A. Wallis Budge.

Mario Murzi is a member of the Italian Philosophical Society and editor of the journal *Notiziario di informatica*. His primary area of research interest is the history and philosophy of science. He has written on Carnap, Hempel, Reichenbach, and logical positivism in the *Internet Encyclopedia of Philosophy* and on Reichenbach in the *MacMillan Encyclopedia of Philosophy*, second edition.

Jo Nabuurs was born in 1936 in the Netherlands. He studied philosophy and history at the University of Leiden and later taught at the Hogeschool of Rotterdam. Since 1999 he has been a research worker at the University of "Humanistiek" and at the Humanist Archive, both in Utrecht.

Joe Nickell is senior research fellow of the Committee for Skeptical Inquiry (formerly CSICOP). A former stage magician, private investigator, and university writing teacher, Nickell is author, coauthor, or editor of more than twenty books, including *Looking for a Miracle* and *Crime Science*. His Web site is www.joenickell.com.

Kai Nielsen is emeritus professor of philosophy at the University of Calgary and adjunct professor of philosophy at Concordia University, Montreal. He has also taught at Amherst College, New York University, and Ottawa University. He is a member of the Royal Society of Canada. He is author of (among other works) *Ethics without Religion*, *Philosophy and Atheism*, and *Naturalism without Foundations*.

David C. Noelle is assistant professor of computer science and psychology at Vanderbilt University and an investigator at Vanderbilt's Center for Integrative and Cognitive Neuroscience. His research involves the construction, analysis, and evaluation of computational models of human behavior and brain function, focusing on learning mechanisms.

Robert Nola is professor of philosophy at the University of Auckland. He works in philosophy of science, metaphysics, epistemology, and the sociology of science and science education. He is author of *Rescuing Reason* (2003) and coeditor of *After Popper, Kuhn, and Feyerabend* (2000). His current work concerns the scientific method.

Graham Oppy is associate dean of research in the faculty of arts and heads the School of Philosophy and Bioethics at Monash University, Australia. He has published on a wide range of topics in philosophy of religion, including a monograph on ontological arguments.

T. Peter Park earned his PhD from the University of Virginia, writing as his dissertation *The European Reaction to the Execution of Francisco Ferrer*. A librarian from 1972 to 1997, he is now a freelance researcher and writer. His specialties include Thomas Carlyle's social thought, Estonian history, religion, philosophy, astronomy, and the paranormal.

Frank L. Pasquale received his PhD from Northwestern University. He is a cultural anthropologist engaged in research on the nonreligious in the United States. He has contributed articles on humanism, morality and ethics, and church-state separation to *Free Inquiry* and other publications.

Joanne Passet is an assistant professor of history at Indiana University East and the author of *Sex Radicals and the Quest for Women's Equality*. Her current research explores the life of Jeannette Howard Foster (1895–1981), a freethinking librarian and the author of *Sex Variant Women in Literature*.

Gregory Paul, an independent paleontologist and evolutionary scientist, wrote and illustrated *Dinosaurs of the Air* (Johns Hopkins) and edited the *Scientific American Book of the Dinosaur*. He now conducts sociological research at the junction of religion, science, and society. His study in the online *Journal of Religion and Society*—demonstrating a positive link between secularism and measures of social improvement—received global coverage; Paul was labeled the "public enemy No. 1" of the churches by MSNBC.

Manuel Paz-y-Miño holds two degrees in philosophy from San Marcos National University (Lima, Peru). He has taught in several Peruvian colleges. He has authored six books, including *Does God Not Exist?* In addition he has translated, edited, or published another twenty works for the Peruvian *Journal of Applied Philosophy*'s Publishing House Association.

Jean-Claude Pecker, a humanist and skeptical activist, is professor of theoretical astrophysics at the Collège de France. He is a member of the *Académie des Sciences* (Paris) and a laureate of the International Academy of Humanism. His books and many papers concern astronomy popularization, astrophysics, cosmology, the history of science, human rights, pseudosciences, poetry, and studies in art and literature.

Mark Perakh is professor of physics emeritus at California State University, Fullerton. He has to his credit nearly three hundred scientific publications, a number of patents, and a number of prizes for his research. He has also been active in the anticreationism debate; his recent book is *Unintelligent Design* (2004).

Mark Philp is head of the department of politics and international relations at the University of Oxford and a fellow of Oriel College. He is the general editor of *The Collected Works of William Godwin* and has written widely on political theory and late eighteenth-century history.

He has written several books on evolution and skepticism, including *Denying Evolution* (2002). He has contributed articles to *Free Inquiry*, *Skeptical Inquirer*, and *Philosophy Now* and publishes a popular monthly e-column, "Rationally Speaking."

Lois Porter cofounded the Washington Area Secular Humanists (WASH) in 1989. She served as its president for four years and was for more than a decade the assistant editor of its newsletter, *WASHline*. She has contributed articles to *Free Inquiry*, *WASHline*, and to two WASH publications.

Alan R. Pratt is professor of humanities at Embry-Riddle Aeronautical University. He is author of articles on nihilism and culture, compiler of the nihilistic collection *The Dark Side: Thoughts on the Futility of Life*, and editor of *Black Humor: Critical Essays* and *The Critical Response to Andy Warhol*.

John Valdimir Price is the author of several works on David Hume, the Scottish Enlightenment, and other aspects of eighteenth-century life and literature. Formerly a senior lecturer and research fellow at the University of Edinburgh, he is now retired and works as an independent scholar and antiquarian bookseller.

Robert M. Price lives with his wife and daughters in North Carolina. He holds PhD degrees in Systematic Theology (1981) and New Testament (1993) from Drew University. He is author of *Deconstructing Jesus* and *The Incredible Shrinking Son of Man* and editor of the *Journal of Higher Criticism*. He is a fellow of the Committee for the Scientific Examination of Religion's Jesus Project.

Jesús Puertas Fuertes taught philosophy in Spain. His academic background included history, philosophy, and computer science. He was a lecturer and author of articles on humanist and skeptical topics. He coedited of *Racionalismo y Evolucionismo* (1998).

Benjamin Radford is managing editor of the science magazine *Skeptical Inquirer* and director of publications at the Center for Inquiry/Transnational. He has written on topics including urban legends, mass hysteria, mysterious creatures, and media criticism. He is the author or coauthor of two books on related topics.

Gino Raymond is a professor of French studies at the University of Bristol in the UK. His research focuses on the emanations of France's political culture in all its aspects, from literary production to the language of contemporary politics. His books include *France during the Socialist Years* (1994), *André Malraux: Politics and the Temptation of Myth* (1995), and *Structures of Power in Modern France* (1999).

Katharine M. Rogers, professor emerita of English, City University of New York, is the author of *L. Frank Baum: Creator of Oz* (2002) and editor of *Policeman Bluejay*. She discusses traditional Christian churches' callousness toward animal welfare in her *Cat and the Human Imagination* (1998) and *First Friend: A History of Dogs and People* (2005).

Born in Spa, Belgium, **Jacques G. Ruelland** emigrated to Canada in 1969. He completed three MA degrees in philosophy, history, and museology, becoming a PhD in the history of sciences. He currently teaches in the department of history at the University of Montreal. He has authored more than twenty-five books.

Herbert K. Russell is a former college English teacher and director emeritus of John A. Logan College's public relations unit. Previous publications on Edgar Lee Masters include entries in the *Dictionary of Literary Biography* and *Dictionary of Midwestern Literature*. Russell's *Edgar Lee Masters: A Biography* was published by the University of Illinois Press in 2001.

Susan Sackett is president of the Humanist Society of Greater Phoenix and a humanist celebrant. She was for seventeen years executive assistant to *Star Trek* creator Gene Roddenberry, and cowrote several episodes of the TV series *Star Trek: The Next Generation*. Her eleven books include the memoir *Inside Trek*.

William J. Scheick holds the J. R. Millikan centennial professorship at the University of Texas at Austin. His books include *The Splintering Frame: The Later Fiction of H. G. Wells* (1984), *Fictional Structure and Ethics: The Turn-of-the-Century English Novel* (1990), and *The Ethos of Romance at the Turn of the Century* (1994).

John R. Shook is director of the Naturalism Research Project at the Center for Inquiry/Transnational. Formerly associate professor of philosophy and director of the Pragmatism Archive at Oklahoma State University, he authored *Dewey's Empirical Theory of Knowledge and Reality*, edited *Pragmatic Naturalism and Realism*, coedited the *Blackwell Companion to Pragmatism*, and edited the *Dictionary of Modern American Philosophers*.

Vladimir Shtinov is a freelance scholar who holds a doctorate in philosophy from Moscow State University. His interests include the history of philosophy and social and political thought. He has published a number of articles in scholarly publications both in Russia and in the United States.

Gary Sloan holds a PhD in American literature from Texas Tech University. In 1999 he retired from Louisiana Tech University, where he was George Anding professor of English. In retirement he has written for such magazines as *Free Inquiry*, *Skeptic*, *Skeptical Inquirer*, *The Humanist*, *American Atheist*, and *The Freethinker*.

J. J. C. Smart is an emeritus professor of Adelaide and Australian National universities. At present he is an honorary research fellow of Monash University. He is an honorary fellow of Corpus Christi College, Oxford. His main interests have been in metaphysics (including philosophy of mind), philosophy of science, and ethics.

Barbara Smoker was born into a devout Roman Catholic family in London, England. She converted to atheism by reading and thinking. From 1971 to 1996 she was the "hands-on" president of Britain's National Secular Society. Publications include a school textbook, *Humanism* (1973), with three updated editions.

Stefan Lorenz Sorgner teaches philosophy and applied ethics at Friedrich-Schiller University, Jena, Germany. He is author of *Metaphysics without Truth* (Munich: Utz, 1999) and coeditor of (with Oliver Fuerbeth) *Musik in der deutschen Philosophie* (Stuttgart: Metzler, 2003), (with Nikolaus Knoepffler and Dagmar Schipanski) *Humanbiotechnologie als gesellschaftliche Heraus-*

forderung (Freiburg: Alber, tbp), and (with H. James Birx and Nikolaus Knoepffler) *Eugenik und die Zukunft* (Freiburg: Alber, tbp).

Barbara Stanosz retired as professor of philosophy from Warsaw University, Poland. She is the founder and the first editor-in-chief of the journal *Bez Dogmatu* (Without Dogma).

David Ramsay Steele grew up in Birmingham, England. He holds a BA in sociology and a PhD from the University of Hull. He wrote *From Marx to Mises* (1992) and coauthored (with Michael Edelstein) *Three Minute Therapy* (1997). He is editorial director of Open Court Publishing Company, Chicago.

Vic Stenger is emeritus professor of physics at the University of Hawaii and adjunct professor of philosophy at the University of Colorado. He has published six books that interface between physics and cosmology and philosophy, religion, and pseudoscience, most recently *God: The Failed Hypothesis* (2007).

Walter Stephens is the Charles S. Singleton professor of Italian studies at Johns Hopkins University. His books include *Demon Lovers: Witchcraft, Sex, and the Crisis of Belief* (Chicago, 2002) and *Giants in Those Days: Folklore, Ancient History, and Nationalism* (Nebraska, 1989). He has written extensively on Renaissance literature.

Barbara Stocker grew up without heavy indoctrination into religion and began to doubt the efficacy of prayer when forced to pray in public schools. She was business manager for *American Rationalist* and the longtime editor of *Secular Subjects*, the newsletter of the Rationalist Society of St. Louis, Missouri.

Harry Stopes-Roe studied physics at Imperial College London but switched to philosophy at Cambridge University, receiving his PhD. While a lecturer in science studies at Birmingham University, he decided that science fatally undermined religion and its morality, and his main attention turned to the problems of making sense of life on naturalistic foundations—that is, humanism.

William Sweet is professor of philosophy at St. Francis Xavier University (Canada). The author of *Idealism and Rights* (1997; 2005), he has published several collections of scholarly essays, including *Philosophy, Culture, and Pluralism* (2002), *Philosophical Theory and the Universal Declaration of Human Rights* (2003), and other works.

Robert B. Talisse is assistant professor of philosophy at Vanderbilt University. His research is focused on contemporary political philosophy. Much of his work draws upon the classical pragmatists, especially the epistemology of Charles Peirce. His most recent book is *Democracy after Liberalism* (2004). He is also the coeditor of *Aristotle's Politics Today* (2007).

Robert B. Tapp is dean of the Humanist Institute and professor emeritus of humanities, religious studies, and South Asian studies at the University of Minnesota. He is an executive board member of the Committee for the Scientific Examination of Religion, author of *Religion among the Unitarian Universalists: Converts in the Stepfathers' House*, and editor of *Multiculturalism* and *Ecohumanism*.

Ann Thomson, professor at Paris 8 University, is a specialist on intellectual history and has published widely on eighteenth-century materialism and irreligious thought. Works include *Materialism and Society in the Mid-Eighteenth Century: La Mettrie's "Discours préliminaire"* (1981) and *La Mettrie, Machine Man, and Other Texts* (1996).

Rob A. P. Tielman is a sociologist, a laureate of the International Academy of Humanism, and emeritus professor in humanism at the University of Utrecht (Netherlands). He was president of the Dutch Humanist League and the International Humanist and Ethical Union, and is president of the Dutch Pluralist Schools Network and the Dutch Humanist Archives. He was knighted by the Queen of the Netherlands in 1987.

Michael Tooley, formerly professor of philosophy at the University of Western Australia and senior research fellow at the Australian National University, is professor of philosophy at the University of Colorado at Boulder. His books include *Abortion and Infanticide* (1983), *Causation* (1987), and *Time, Tense, and Causation* (1997).

Miguel A. De La Torre is associate professor of social ethics at Iliff School of Theology and director of Iliff's Justice and Peace Institute. He has published nine books over the past six years, three of which exclusively deal with Cuban religiosity: *The Quest for the Cuban Christ*, *La Lucha for Cuba*, and *Santería*.

David Tribe is a polymath author, journalist, lecturer, broadcaster, poet, and artist. He has served as president of the National Secular Society, chair of Humanist Group Action, and editor of *The Freethinker* (all UK). An honorary associate of the Rationalist Press Association, he now resides in Australia.

Gopi Upreti is director of the Center for Inquiry/Nepal and founding president of the Humanist Association of Nepal (HUMAN). A professor at Tribhuvan University, Nepal, he teaches ecological agriculture and horticulture at the Institute of Agriculture and Animal Sciences and is

a founder of the Nepal Institute of Health Sciences (NIHS) at Purbanchal University.

Vijayam (Goparaju) is executive director of the Atheist Centre in Vijayawada, India, which was founded by Gora in 1940. He is a lecturer in political science at Andhra University and director of research at the Gandhi Peace Foundation, New Delhi. He is the author of five books and four hundred articles on atheism, humanism, science, environment, and social change and editor of the Atheist Centre's English-language monthly *Atheist*.

Sally Roesch Wagner, executive director of the Matilda Joslyn Gage Foundation, is one of the first women to receive a doctorate for work in women's studies and a founder of one of the country's first women's studies programs. The author of numerous books and articles, she appeared in Ken Burns's documentary *Not for Ourselves Alone: The Story of Elizabeth Cady Stanton and Susan B. Anthony.*

G. A. Wells is emeritus professor of German at the University of London, where he taught German language, literature, and philosophy for forty-two years until his retirement in 1991. He holds degrees in these subjects and in natural sciences. His books include works on German thinkers and on the origin of language, as well as on Christian origins.

Ruth Whelan is the professor of French and head of the department of French at the National University of Ireland, Maynooth, and a member of the Royal Irish Academy. She is the author of *The Anatomy of Superstition: A Study of the Historical Theory and Practice of Pierre Bayle* (1989) and related works and one of the editors of the *Encyclopedia of the Enlightenment* (2003, 4 vols.).

A past president and present vice president of the New York State Philosophical Association, he has completed his editing of the works of Bishop Butler for the University of Rochester Press. For many years he has been active in the Bertrand Russell Society.

Fred Whitehead, who with Verle Muhrer edited *Freethought on the American Frontier* (1992), retired in 2000 from the administrative staff of the University of Kansas School of Medicine. For several decades he has collected scarce materials on American cultural history, especially concerning labor, radicalism, and intellectual controversy, and he has published extensively on these subjects. He is the editor of *Freethought History.*

Rabbi Sherwin T. Wine is the founder of Humanistic Judaism and its flagship congregation, the Birmingham Temple, which he established in 1963. He also established the Society for Humanistic Judaism and helped to create the International Federation of Secular Humanistic Jews. He is author of *Humanistic Judaism*, *Judaism beyond God*, and other books.

Kwasi Wiredu is distinguished professor of philosophy at the University of South Florida, Tampa. He was born in Ghana and studied philosophy at the University of Ghana and at Oxford. He taught philosophy in Ghana for twenty-three years. His publications have focused on the philosophy of logic, epistemology, and African philosophy.

Frieder Otto Wolf taught philosophy since 1966 at Saarbrücken, Coimbra, and Berlin universities. Active in politics, he was a Member of the European Parliament from 1994 to 1999. He is vice president of the German humanist organisation *Humanistischer Verband Deutschland* and president of the Humanist Academy of Berlin.

Paul Woodruff teaches philosophy and classics at the University of Texas at Austin. He has published translations of work by Thucydides, Sophocles, Euripides, and Plato, while pursuing his interest in the Greek enlightenment of the fifth century BCE.

Martin D. Yaffe is professor of philosophy and religion studies at the University of North Texas. He is author of *Shylock and the Jewish Question* (1997), cotranslator of Thomas Aquinas's *Literal Exposition on the Book of Job* (1989), editor of *Judaism and Environmental Ethics: A Reader* (2001), and translator of Spinoza's *Theologico-Political Treatise* (2004).

Matt Young is senior lecturer in physics, Colorado School of Mines, and former physicist with the National Institute of Standards and Technology. He is author of *No Sense of Obligation: Science and Religion in an Impersonal Universe* (2001) and coeditor of *Why Intelligent Design Fails: A Scientific Critique of the New Creationism* (2004).

ACKNOWLEDGMENTS

As should be obvious, I owe an incalculable debt to the late Gordon Stein for conceiving the original *Encyclopedia of Unbelief*, and for organizing and editing this work's precursor so expertly. I gratefully acknowledge also the leadership and support of Paul Kurtz, who played a seminal role in creating Stein's original encyclopedia and whose idea the *New Encyclopedia* was.

I am obliged to the Council for Secular Humanism and the Center for Inquiry, where my career has unfolded since 1989. In my work I have enjoyed the immense privilege of meeting and networking with unbelieving academics, activists, pundits, social critics, and other leaders of thought worldwide. This experience made it possible to bring together such diverse and illustrious individuals—first as members of the Editorial Advisory Board, and then, of course, as contributors.

I appreciate the work of the members of the Editorial Advisory Board, whose prized input helped to shape the present work, especially insofar as its structure departs from that of the 1985 *Encyclopedia*.

I am grateful to Tim Binga, Gordon Stein's successor as director of the Center for Inquiry Libraries, who provided outstanding reference support throughout the compilation process and who put obscure freethought tomes at my disposal whenever I needed them. Kevin Christopher provided custom entry management software. I am equally appreciative of my "serial contributors," each of whom shouldered the burden of authoring numerous entries:

Norm R. Allen Jr.
Hector Avalos
Joseph Barnhart
Timothy Binga
Vern L. Bullough
Bill Cooke
Annie Laurie Gaylor
Robert Helms
Julie Herrada
Jim Herrick
Finngeir Hiorth
Paul Kurtz
Timothy J. Madigan
Robert M. Price
Robert Tapp
David Tribe
Fred Whitehead

Special thanks to Gwen Brewer for ably proofreading the many entries by her late husband, Vern Bullough. Of course I owe a debt to all of the *New Encyclopedia*'s contributors. It is worth noting that each was solicited as a volunteer. In contrast to more mainstream reference works that can offer token (and sometimes not-so-token) payments for each article, the *New Encyclopedia* approached its authors with nothing more than the promise of intellectual gratification and a complimentary copy of the work. So the *New Encyclopedia* should be recognized as a labor of love on the part of a great number of people.

I am beholden to Steven L. Mitchell and Jonathan Kurtz of Prometheus Books for their support of the project and their forbearance with the numerous delays that seem endemic in an undertaking of this scope, and to Meg French, my indefatigable editor.

Finally, I gratefully acknowledge the work of my successive editorial assistants, who expertly discharged a daunting variety of tasks during the *New Encyclopedia*'s long gestation. Ranjit Sandhu provided administrative support for the creation of the Editorial Advisory Board, the topic selection process, and the first rounds of contributor invitations. Matt Cravatta assumed this role thereafter, and I cannot say enough about his dogged and precise work in maintaining relations with the numerous contributors, answering information requests, keeping track of completed and delinquent entries, and most of all his determination and willingness to innovate when peculiar problems leapt for our throats in the shadow of deadlines. Well done!

FOREWORD

RICHARD DAWKINS

The term *unbelief* sounds negative. One might ask, "How can you have an encyclopedia of anything defined as an absence?" There are encyclopedias of music, but who would buy an encyclopedia of tone deafness? I have seen and enjoyed an encyclopedia of food, but never an encyclopedia of hunger.

The first thing wrong with these comparisons is that both music and food have positive associations. Tone deafness is an absence of something valued. So is hunger. Among the many things this encyclopedia demonstrates is that religious unbelievers are not similarly deprived. For many—and I shall return to this—unbelief serves as a liberating gateway to a more fulfilled life.

The second thing that might give us pause about unbelief is that there exists an all but infinite number of things in which we don't believe, but we don't go out of our way to say so. I am an unbeliever in fairies, unicorns, werewolves, Elvis on Mars, spoon bending by mental energy, the Easter Bunny, green kangaroos on Uranus . . . the list could be expanded trivially and without end. We don't bother to declare ourselves unbelievers in all the millions of things that nobody else believes in. It is only worth bothering to declare unbelief if there is a default assumption that we all must believe in some particular hypothesis unless we positively state the contrary.[1] Manifestly, and in spades, that is the common assumption over the hypothesis of divine intelligence.

Divine intelligence is not the only thing that is both widely believed and widely doubted. The word *skeptic* rather than *unbeliever* is commonly applied to those who doubt the widespread claims of astrology, homeopathy, telepathy, water divining, clairvoyance, alien sexual abduction, and communication from beyond the grave. Skeptics in this sense do not necessarily deny the validity of these claims; instead, they demand evidence and sometimes go out of their way to set up the rather stringent conditions—much more stringent than supporters usually realize—that proper evidence requires. Supporters of homeopathic medicine or dowsing, for example, seldom understand the need for statistically analyzed, double-blind controlled experiments to guard against chance effects, placebo effects, and the unwitting suggestibility of the believing mind. It is a matter of convention that *skeptic* has come to be associated with those matters, while the superficially synonymous *unbeliever* implies *religious* unbelief. The two kinds of skepticism/unbelief often go together, but you can get into trouble if you simply assume that they do.

There is further ambiguity over whether "unbelief" signifies positive disbelief or a mere lack of belief. The dictionary definition allows either. In the original 1985 *Encyclopedia of Unbelief*, its editor, Gordon Stein, interpreted *unbelief* to mean a definite belief that deities (from now on, for brevity, I shall use *God* to stand for supernatural deities in general) do *not* exist. Others could easily mean something more agnostic. Within agnosticism there are those who feel that, because we can neither prove nor disprove the existence of God, existence and nonexistence are therefore completely undecidable hypotheses, on an exactly equal footing with each other and having equal probability. Then, of those agnostics who forswear such "equal probability" impartiality, there is a spectrum of those who lean one way or the other. The following five representative propositions span the spectrum:

1. **Strong Theist.** In the words of C. G. Jung, "I do not believe, I *know.*"
2. **Agnostic, Leaning toward Theism.** I cannot know for certain, but I think the existence of God is highly probable.
3. **Truly Impartial Agnostic.** It is impossible to prove or disprove the existence of God. This is often illogically taken to imply that his existence and his nonexistence constitute equally probable hypotheses.

4. **Agnostic, Leaning toward Atheism.** It is impossible to disprove God, but he is just as improbable as fairies or unicorns.
5. **Strong Atheist.** I know there is no God, with the same conviction as Jung "knows" there is one.

I suspect that most contributors to this encyclopedia, including me, would place themselves somewhere around 4 or 4.5 in the spectrum, while most thinking churchgoers would not stray far beyond position 2 or 1.5 at the other end. Positions 1 and 5 are too strong for most reasonable people. This really is a spectrum, by the way. A research questionnaire to measure religious belief could sensibly invite participants to place themselves along a continuously scalar graph, with these five positions serving as guideposts.

Religious belief itself is subject to ambiguity and misunderstanding. Here is another spectrum of statements, all of which might be claimed as "religious" by those who utter them.

1. **Strong Theism.** God is a personal being whose exact nature is specified in my holy book (as opposed to yours!): an intelligence who created the universe, who can see into your mind, who cares about your vices and virtues, and who will punish or reward you for all eternity after you die.
2. **Deism.** God is some kind of supernatural intelligence who laid down the laws of physics and started the universe off, but then stood back and intervened no more in its subsequent development and evolution.
3. **Einsteinian "Religion."** God does not exist as a personal intelligence at all, but the word may be used as a poetic metaphor for the deep laws of the universe that we don't yet understand.

Once again the spectrum is continuously distributed, and people who call themselves religious might be invited to locate themselves using a pencil mark on a graphical axis with my three propositions as guide posts. My own position would be 3, except that I deplore the use of the word *God* itself in the Einsteinian sense (or in the sense of Stephen Hawking's "For then we should know the mind of God") because I think it has actively confused many people. I prefer to limit the word "religious" to 1 and 2. Einstein called himself religious, but if Einstein was religious it is hard to imagine who is not: no sensible person denies that there are deep laws and principles underlying the universe.

An American student asked her professor whether he had a view about me. "Sure," he replied. "He's positive science is incompatible with religion, but he waxes ecstatic about nature and the universe. To me, that is religion!" But is *religion* the right word to use? Words are our servants, not our masters, but there are many people out there, passionate believers in supernatural religion, who are only too eager to misunderstand.

There is a tactical, political point to be made here. Maybe Einsteinian "religion" provides a useful way for atheists to euphemize their way into American society and lessen the grip of fundamentalist theocracy. In the twenty years since the original *Encyclopedia of Unbelief* was published, the expected decline in religiosity has continued apace in western Europe, but the reverse has happened in North America and the Islamic world. The hapless European sometimes feels cornered in a nightmarish pincer movement between Islamic and Christian jihadists in holy alliance. The United States is now suffering an epidemic of religiosity that seems almost medieval in its intensity and positively sinister in its political ascendancy (See DEMOGRAPHICS OF UNBELIEF). At various times in history it has been impossible for a woman, a Jew, a homosexual, a Roman Catholic, or an African American to gain high political office. Today this negative privilege is pretty much restricted to atheists and criminals. The actress Julia Sweeney, in her beautiful theatrical monologue "Letting Go of God," recounts with black humor her parents' response to her own gentle atheism.

> My first call from my mother was more of a scream. "Atheist? ATHEIST?!?!"
>
> My dad called and said, "You have betrayed your family, your school, your city." It was like I had sold secrets to the Russians. They both said they weren't going to talk to me anymore. My dad said, "I don't even want you to come to my funeral." After I hung up, I thought, "Just try and stop me."

> I think that my parents had been mildly disappointed when I'd said I didn't believe in God anymore, but being an *atheist* was another thing altogether.

Well, that's just one woman's parents. But the mischief reaches all the way to the top. On a now notorious occasion in 1987, the following dialogue is alleged to have taken place between George Herbert Walker Bush and Robert Sherman, one of the reporters at a news conference held by the then–vice president and soon to be successful presidential candidate:

> **Sherman:** What will you do to win the votes of the Americans who are atheists?
>
> **Bush:** I guess I'm pretty weak in the atheist community. Faith in God is important to me.
>
> **Sherman:** Surely you recognize the equal citizenship and patriotism of Americans who are atheists?
>
> **Bush:** No, I don't know that atheists should be considered as citizens, nor should they be considered patriots. This is one nation under God.
>
> **Sherman** (somewhat taken aback): Do you support as a sound constitutional principle the separation of state and church?
>
> **Bush:** Yes, I support the separation of church and state. I'm just not very high on atheists.

The tone in which Bush uttered these disgracefully bigoted words—just try substituting the word *Jew* for *atheist* in the above dialogue—is not recorded. I imagine it as condescendingly jocular, which makes it even more deplorable. Again, try the experimental *Jew* substitution, and see whether a humorous tone makes it sound any better. It doesn't.

Disgraceful as it may be, it is indicative of the standing of atheism in modern America. One can argue that the problem lies in the ludicrously demonized word *atheist* itself. Julia Sweeney's parents made this more or less explicit. If Robert Sherman had quoted Einstein and asked Bush his attitude to those Americans who do not believe in a personal God but harbor a deep reverence and awe for the majestically deep mysteries of the universe, he would have received a far more sympathetic and civilized answer. Yet if you look at the detail of what Einstein said, notwithstanding his God-encumbered language he was just as much of an atheist as, say, Bertrand Russell or Robert Green Ingersoll or any typical Fellow of the Royal Society or the National Academy of Sciences. Einsteinian euphemisms have probably enabled more than one intelligent, thinking person to achieve election to high office.

Some see this as a tactical argument for ditching the word *atheist* altogether, and calling ourselves *Brights*, analogous with the way homosexuals positively rebranded themselves as *gays*.[2] Various more or less attractive attempts are made to turn Einstein-style pantheism into organized quasi religions with names like Religious Naturalism[3] or World Pantheism;[4] and perhaps this, or Universism,[5] is the politically expedient way to go. Others prefer to tough it out and call a spade a spade, while making consciousness-raising efforts to rehabilitate the word *atheist* itself.

Maybe "politically expedient" is too cynical. Carl Sagan's ringing declaration in *Pale Blue Dot* can be read as positively inspiring:

> How is it that hardly any major religion has looked at science and concluded, "This is better than we thought!" "The Universe is much bigger than our prophets said, grander, more subtle, more elegant"? Instead they say, "No, no, no! My god is a little god, and I want him to stay that way." A religion, old or new, that stressed the magnificence of the Universe as revealed by modern science might be able to draw forth reserves of reverence and awe hardly tapped by the conventional faiths. Sooner or later, such a religion will emerge.

Back to liberation: we experience liberation only by comparison with captivity. Nobody today feels liberated by unbelief in Thor's hammer or Zeus's thunderbolts, though our ancestors might have done so. Today, huge numbers of people are brought up to treat belief in—depending on

an accident of birth—Christianity, Islam, Judaism, or Hinduism as an expected norm, departure from which is a grievous and onerous decision (to put it no more strongly: the official Islamic penalty for apostasy is death). Women, in many parts of the world, have additional reasons to regard the end of religion as a liberation (see WOMEN AND UNBELIEF).

I frequently receive letters from readers of my books, thanking me for liberating them from the bondage of religion. I'll quote just one example, renaming the author Jerry because—reasonably enough, given Julia Sweeney's experience—he is deeply worried lest his parents discover his newly gained unbelief. Jerry's youthful indoctrination as an evangelical Christian was depressingly successful. He recounts how, in his last year at school,

> the headmaster chose a small group of brighter boys to study philosophy with him. He probably regretted selecting me, as I made it perfectly clear during class debates that there really was no need for such discussions—the answer to all life's problems was simple, and it was Jesus.

Jerry's liberation had to wait until his postgraduate years:

> My postgraduate studies, however, opened my mind to a world of ideas I barely knew existed. I met highly intelligent fellow students who had applied their rationality to all aspects of their lives, and come to the conclusion that there was no God. And, amazingly, they were happy, they enjoyed life, they didn't feel the "God-shaped hole" that I had warned people about so often [Jerry had done a stint as a missionary, financed by well-meaning donations from his home church]. . . .
>
> For the first time in my life, I was willing to be challenged. "Bliss was it in that dawn to be alive." I craved more intellectual meat . . . and so I spent the summer of 1998 devouring book upon book.

Among the books he devoured were two of mine, which explains his writing to me. He went on to expound his reaction to these and other books:

> The dawning realization that I could safely jettison my increasingly tenuous faith, and that a world without God wouldn't be the joyless hell I had always imagined it would be, was overwhelming. I felt liberated. All the benefits of Christianity that I had promoted—that faith brings you freedom, meaning, purpose, joy etc.—I now discovered for real, but on the wrong side!

How are we liberated when we forsake religion? Let me count the ways! Morally we are freed—to a greater or lesser extent, depending on the religion—from an ominous burden of guilt and fear. The awful notion of private "sin" is never far from the minds of the pious, and we cannot but feel joyous release when we shake it off and replace it by the open good sense of moral philosophic reasoning. In place of private "sin," we choose to behave in such a way as to avoid causing suffering to others and increase their happiness.

Practically we are freed, depending on the details of the particular faith in which we were raised, from the fatuity and inconvenience of time-wasting rituals: freed from the necessity to pray five times a day; freed from the duty to confess our "sins" to a priest; freed from having to buy two refrigerators, lest meat and milk should meet; freed from enforced laziness on Saturdays to the point of being unable to move a light switch or lift a telephone; freed from having to wear uncomfortable and unbecoming clothes lest a flash of forbidden skin should be exposed; freed from the obligation to mutilate children too young to defend themselves.

Intellectually, we are freed to pursue evidence and scholarship wherever it might lead, without constantly looking over our spiritual shoulder to check whether we are straying from the party line. "Party line" is right, even when it is not dictated by living priests, elders, or ayatollahs, but fossilized in a book (actually a motley collection of arbitrarily stitched-together fragments whose anonymous authors were writing in different times and to different audiences, reflecting different local and long-dead issues).

Personally, we are freed to direct our lives toward a worthwhile fulfillment, in the full knowledge and understanding that this is the one life we shall ever have. We are freed to

exult in the privilege—the extraordinary good fortune—that we, each individual one of us, enjoy through the astronomically improbable accident of being born. The measure of the privilege you and I enjoy through existing is the number of possible people divided by the number of actual people. That ratio—too large for decent computation—should be the measure of our gratitude for life and our resolve to live it to the full. Well might the newly liberated unbeliever quote Wordsworth and his blissful dawn.

NOTES

1. When a young woman of my acquaintance was admitted to hospital, a nurse came round to fill in her personal details form. To the nurse's question "Religion?" my friend answered, "None." Later she overheard a pair of nurses gossiping about her: "She doesn't *look* like a nun!" Isn't it bizarre that such official forms always ask our religion, and assume that we have one? Why not note down our political persuasion, our taste in music, or our favorite color?

INTRODUCTION

AGAINST THE SEDUCTIONS OF MISBELIEF

Tom Flynn

The volume before you is the successor to *The Encyclopedia of Unbelief*, which was edited by Gordon Stein and published by Prometheus Books in 1985. The original *Encyclopedia* was something that had never before existed: a comprehensive reference to unbelief in religion.[1] Stein was his generation's foremost historian, bibliographer, and literary collector in atheism, agnosticism, freethought, and related domains. He was the perfect choice to edit the original *Encyclopedia*, which enjoyed the success it richly deserved and immediately became the field's standard reference.

SO, WHY A *NEW ENCYCLOPEDIA*?

There are several reasons why I believe this volume was not just important, but necessary:

First, the twenty-two years since the original work appeared have seen more than their share of history unfold. On the world stage, the fall of Communism utterly reshaped the context in which religious unbelief is understood. The United States, too, has seen significant developments, from the grisly death of raucous atheist activist Madalyn Murray O'Hair[2] to the rise of a vigorous, academically respected secular humanist movement.[3]

Second, there have been multiple reorientations as regards the role of religion in society worldwide. Once again, there was the fall of Communism. With the collapse of regimes committed to dialectical materialism and the near-disappearance of Marxist academics, Western atheists and humanists found themselves more nearly alone on the barricades of unbelief than they had been in more than a century. Meanwhile, western Europe was freed from the intellectual and physical threat entailed in its immediate proximity to the Soviet empire. It responded by becoming openly post-Christian; the United States moved in the opposite direction, and is now the only first world society that displays third world levels of religiosity.[4] Strong growth in public piety, brazen reentanglement of religion and government, and heightened acceptance for strident religious expression in public venues came to dominate the American scene after 1990. Yet during the same period, the number of Americans who told pollsters and social scientists that they reject any formal religious affiliation more than doubled. While all of this was taking place, radical Islam greatly expanded its influence, becoming a focus of social turmoil not only in the Middle East but across Indonesia, the Indian subcontinent, Africa, and Europe, even as it furnished the worldwide background for the so-called war on terrorism. During the same years, Christianity, Hinduism, Judaism, and Islam all began to exhibit a disturbing trend: In areas where religious practice *was* expanding, the type of religious practice that expanded most rapidly tended to be socially and doctrinally conservative and theologically literalistic. Often such expansion occurred at the expense of more historically and scientifically sophisticated, theologically moderate outlooks. It was as though in all four traditions, great ages of liberal secularism were drawing to a simultaneous close. In the United States Christian fundamentalists and evangelicals shouldered aside "mainline" Protestant denominations and sharply marginalized religious liberalism. In India an aggressively nationalistic Hindu fundamentalism threatened to supplant progressive, secularizing viewpoints prevalent since the days of Nehru.[5] Across the Jewish Diaspora, Orthodoxy—which had not long before seemed poised for extinction—regained robust vigor; in Israel Orthodoxy and ultra-Orthodoxy attained a position from which they often oppressed

more liberal forms of Judaic practice. In the Muslim world secularizers in the mold of Kemal Atatürk were reviled by fundamentalists and in some countries dared not raise their heads.[6] If the religious environment has changed so radically, then irreligion too deserves fresh scrutiny.

The third and final reason to compile a new encyclopedia is less high-flown: there were just some things about the 1985 *Encyclopedia* that I (or members of the Editorial Advisory Board) wished to approach differently. Compared to its precursor, the current work relies less heavily on survey articles. There are more biographical entries. A greater effort has been made to place unbelief—in particular, nineteenth-century freethought—into a richer context vis-à-vis its companion radical reform movements, including anarchism, socialism, labor reform, feminism and woman suffrage, sex radicalism, and even Spiritualism.[7] Care was also taken to present a balanced portrait of twentieth-century American unbelief, including the unsavory digressions some activists made into eugenics, racism, and fiscal opportunism.[8]

Over the years since the original *Encyclopedia*'s release, some parts of it aged better than others. Stein included as appendices directories of unbelieving groups and publications; these became obsolete too quickly in an otherwise enduring work. For that reason, and because directory-style information is now so easily obtained from the Internet, tables of groups and publications have been omitted from the *New Encyclopedia*. Another appendix to the 1985 work combined a bibliography of unbelief and a directory of publishers. In view of the pending release of Bruce Cathey's mammoth worldwide bibliography of unbelief, whose scope far exceeds anything that could have been attempted here, the present work contains no bibliographic appendix.

WHY "UNBELIEF"?

The word strikes some as clumsy and negative. Why call this volume—or its predecessor—an encyclopedia of *unbelief*? It is a question I heard often, and one that Stein anticipated in his introduction to the 1985 work:

> In the English language about the closest synonym for *unbelief*, as it is being used here, is *heterodoxy*. That word, in turn, can be said to mean "not holding orthodox beliefs or traditional opinions"—on religious matters, in our context. . . . This is the history of heresy, blasphemy, rejection of belief, atheism, agnosticism, humanism, and rationalism. In many respects, it is also the history of the intellectual progress of the human race.[9]

In a movement with a rich, sometimes contentious sectarian history, *unbelief* is one of the few labels no major faction ever claimed. For that reason one hopes it can be equally inclusive toward atheists and agnostics, deists and freethinkers, religious humanists and secular humanists, Ethical Culturists and infidels. *Unbelief* covers the conceptual floor they all share, heedless of disputes between reductive materialists and rational mystics, deaf to the arguments between moral nihilists and secular humanists who claim objective validity for their ethical moral codes. Despite their differences, they all share a foundational disbelief in any religious system or supernatural domain. They're all unbelievers, and the *New Encyclopedia* is for—and about—them.

POLICIES

A few notes are in order concerning the policies that shaped the *New Encyclopedia*'s structure, compilation, and editing.

As a rule, articles do not cite online sources. This decision was made because of the work's long anticipated shelf life relative to the ephemerality of Internet addresses.

In order to qualify for a discrete, named biographical entry, individuals must be deceased. Individuals who died after November 2005 could not be included. In order to qualify for a discrete, named subject entry, organizations and institutions must be defunct, or must have operated continually for more than fifty years as of November 2005. This is intended to prevent the accumulation of evanescent directory-style information about current groups and

institutions. Individuals and organizations denied coverage in freestanding entries may of course be discussed in other entries, and may be located using the index.

Certain issues regarding unbelief are controversial among unbelievers. On several such matters the *New Encyclopedia* unabashedly reflects a "house stance," though contributed articles expressing divergent positions have been welcomed. For example, the *New Encyclopedia* accepts the definitions of the words *atheism* and *agnosticism* defended by Stein in the 1985 work and elsewhere.[10] It interprets *a-theism* in accord with its Greek roots: the absence of belief in a supernatural being. On this view, in order to be an atheist one need not deny the existence of God; it is enough to be without belief that God (or, by extension, a supernatural order) exists. This position has interesting implications. For one, it rejects the popular view of atheism and agnosticism as adjacent points along a single continuum of religious belief and disbelief. This is the notion that underlies flippant accusations that atheists are just agnostics who have grown too sure of themselves, or that agnostics are atheists who don't trust their own judgment. In contrast, this work views atheism and agnosticism as independent qualities. Atheism pertains to the belief or disbelief that a god or a supernatural order exists: a question of fact. In contrast, agnosticism pertains to whether we can have *reliable knowledge* that a god or supernatural order exists: what philosophers call a question of epistemology. From this it follows that a person can be simultaneously an atheist and an agnostic without contradiction. The *New Encyclopedia*'s view is not shared by all the authorities, or even by all of its contributors. Some explicitly characterize atheism and agnosticism as adjacent points on the same continuum, or hold that to be an atheist one must actively deny the existence of a god. Where a distinguished contributor holds such a view, compliance to the "house line" is not demanded—only internal consistency and integrity of argument.

Other "house stances" include:

1. Secular humanism is in no sense a religion.
2. Religion, properly understood, necessarily entails supernaturalism. This rejects Paul Tillich's identification of religion with any "ultimate concern," under which even such things as a passion for fly fishing might be spoken of as one's religion. Similarly rejected is John Dewey's attempt to endow the words *religion* and *religious* with independent meanings, such that any deeply felt commitment might be termed "religious." The *New Encyclopedia* relies on a definition of religion that I offered in 1996: Religion is "a life stance that includes at minimum a belief in the existence and fundamental importance of a realm transcending that of ordinary experience."[11]
3. Science and religion can genuinely stand in conflict. This rejects Stephen Jay Gould's view that, properly understood, religion and science occupy "non-overlapping magisteria" whose agendas never collide. On the contrary, in the *New Encyclopedia*'s view, religion and science offer competing, mutually exclusive accounts in many areas, including cosmology, the origins of life, and even certain moral conundrums.[12]
4. So-called religious humanism merits coverage in this work—even though to the degree that it *is* religious as defined above, it is not a form of unbelief.[13] One reason for this inclusion is historical. From deism to Unitarianism, Universalism, and Ethical Culture, among others, movements that fell short of full "unbelief" have played key roles in countering orthodoxy and in opening social spaces wherein religious doubt could openly be expressed. The second reason to include religious humanism is that many of the contemporary movements and personal commitments that accept the religious humanist label in fact carry no supernatural content. Think of a Unitarian Universalist humanist who has no belief in a cosmic designer, an immortal human soul, or the efficacy of prayer; much as he or she might self-describe as a "religious humanist," such a person simply *isn't* in any rigorous sense religious.[14] A label that includes that word might bring comfort or improve one's perceived standing in others' eyes, but it is a misnomer. For both of these reasons the *New Encyclopedia* includes substantial coverage of religious humanism, undeterred by the handful of its contemporary expressions that truly are religious in the rigorous sense embraced here. These include forms of humanist practice that consider a glorious future for the human species guaranteed (not knowable through purely natural means); that effectively elevate humanity to godlike status (rare); that endorse paranormal claims including divination, astrology, extrasensory perception, and traditional

healing; or that impute independent agency or quasi-supernatural powers to such abstractions such human love, élan vital, or the march of history. Historical examples of genuinely "religious" humanisms would include Comtean positivism and pre-Soviet Marxism. Naming contemporary examples here would be needlessly provocative.

The reader who peruses multiple *New Encyclopedia* entries and comes away with the impression that issues of this character are being treated inconsistently will often be correct, but this divergence reflects actual diversity of opinion on these subjects among unbelievers—and contributors. *Caveat lector.*

WHY DOES A *NEW ENCYCLOPEDIA OF UNBELIEF* MATTER?

In my personal opinion, it matters because unbelief itself matters—admittedly a contentious stance. Many Americans might disagree, noting that religiosity seems so pervasive and is rapidly expanding throughout public life. Some Europeans might disagree also, noting that religiosity has shriveled and now seems socially irrelevant. The very fact that unbelief seems unimportant for opposing reasons—and that merely within the confines of Western culture—should give us pause before we consign unbelief to history's bulging dustbin. It is true that many of unbelief's most prestigious recent advocates—labor reformers, political revolutionaries, and academic Marxists—have largely melted away. It is true, and already noted here, that atheists, agnostics, secular humanists, old-line freethinkers, and anticlericals stand increasingly alone on the barricades of radical reform. Despite these historical developments, the fundamental stance that all unbelievers share, the conviction that the everyday world of matter, energy, and their interactions is either *all that exists* or *all that matters*, has an inescapable significance.

We can grasp this significance by considering how important it would be if unbelievers' naturalistic worldview were definitely proven wrong—say, by some demonstration that one of the conventional theistic worldviews was inarguably true. Imagine for the sake of argument that the core contentions of Christianity were somehow proven correct beyond any possibility of question. If the universe really is intentionally designed, and the designer knows and cares for us—if each of us truly hosts an immortal soul that will know an eternity of ecstasy or pain determined by our behavior during an eyeblink sojourn on earth—if this and the rest of the Christian worldview is true, then *the knowledge that this is true* is the most important item of knowledge any human being could possess. No scientific discovery, no mathematical theorem, no artistic expression, no secret to success, no avowal of love could ever be as significant as the knowledge that gave us *accurately* the key to eternity.

But now imagine (as unbelievers hold to be the case) that *no* conventional theistic worldview is true—but that millions of people still order their lives, allocate their resources, and make decisions as though some form of theism *were* true. Knowing this is terribly important, too, if for a different reason. To believing readers, I propose a thought experiment. Suppose for a moment that unbelievers *are* correct. Suppose that each human being is nothing more than an accidental and temporary convergence of pattern . . . that nothing is eternal . . . that the only values we can hold authentically are the ones we create and embrace for ourselves. Suppose most of all that *this life is the only one that any of us will ever have.* If those things are true, then the most important item of knowledge any religious believer could ever possess is the knowledge that his or her faith is groundless. Denied that knowledge, ardent believers—perhaps we should think of them as *mis*believers—will go on squandering the precious hours and days of their only lives pursuing otherworldly rewards that will—that *can*—never be theirs. In addition to making empty investments in ineffectual prayer and ritual, misbelievers may forsake harmless pleasures (think Mormons and coffee) or even disdain highly beneficial practices (think Christian Scientists and medical care, or Muslims and commercial credit). Recall again that the fastest-growing pieties tend to be literalistic and retrograde, and to grow at the expense of liberal strands within the same faith community. Mere decades ago, religious liberalism held out the promise that it might tame religious conviction, making of it something with which naturalists could effortlessly coexist. Sadly, religious liberalism no longer commands much momentum; in almost every religious community the momentum lies much further to the right. The odds are greater today than at any time in nearly a century that a randomly chosen believer will be a literalist, if

not an outright fundamentalist, within whatever tradition he or she inhabits. If false beliefs are so likely to be taken so seriously by so many, then we cannot avoid this harrowing conclusion: if unbelief is true, countless misbelievers are stunting their only lives in tragic and eventually irremediable ways. Consider the deep-felt pain of men and women who have thought their way from piety to atheism, but achieved this only in their old age—there is no reclaiming a lifetime dissipated in service to a god who never was. That is one reason why unbelief matters very much.

Or consider this: Across our world, billions embrace one religion or another. Tens of billions of person-hours, hundreds of billions of dollars, are devoted to affairs of faith. How much might the human prospect have been improved had this energy and these resources been even partially redirected down the centuries toward improving the human prospect in *this* world? What technological innovations do we live without today, what medical breakthroughs remain undiscovered, what dazzling philosophical and artistic ideas remain unconceived? (Keep in mind that I'm not even talking about the way some faiths engender hostility toward scientific discovery or the social application of its products—for now I'm focused solely on the diversion of resources.) If unbelievers are right and no religion is true, why wait another moment before striving to deflect so much human passion and wealth into channels at whose end some *real* benefit can result?

Finally, consider how much we might learn about the human brain and "human nature" by studying the cognitive mechanisms through which religions exert their extraordinary power.[15] What is it that endows religious ideas—all of them, on this view, untrue—with a compelling psychological resonance so far exceeding that wielded by any of the other sorts of untruths and wild surmises that human beings have seen fit to make up over the ages? Why does religion tug at us (at least, some of us) so urgently? Equally important, why does religion leave some individuals cold? Why does the size of the apparently "faith-resistant" population vary so widely between cultures? (Think of the United States, with its relatively modest unbelieving population, compared to western Europe or Japan, where strong faith is quite exceptional.) From my vantage at the dawn of the twenty-first century, it is difficult to imagine more important questions for the social sciences to examine.[16]

Believers may find these suggestions shocking—which merely underscores the significance of the gulf between the ways believers and unbelievers look at the world. Most (though not all) believers see human nature as a duality of body and spirit; they see their brains not as what they *are* but as things they *have*. They see the universe as planned and purposive, as something understood in its totality by a force that is essentially benign.[17] Many see morality as definite, inflexible, and ordained. Most view reality as eternal and attach primary significance to the countless eons that they expect will come after our earthly sojourn. While unbelievers are far from homogeneous, most would disagree with this cluster of views. Most unbelievers see human nature as monistic; consciousness is simply what goes on in our brains as viewed from the inside, and, yes, Virginia, we *are* our brains. Many reject any idea of "spirit" or immaterial causation; everything *is* physics. Most unbelievers see the universe as unplanned, as purposeless, as something that has never been understood in toto and probably never will be, unless one day human beings (or other intelligences of equally natural origin) rise to meet that challenge. Far from benign, unbelievers see the universe as coldly neutral—or they may discern, as Bertrand Russell did, a mute hostility in the relentless, uncaring order of the cosmos. On morality, opinion is diverse. Some unbelievers feel that morality must be utterly flexible and relative. Some argue that without God all things are possible, so we should launch ourselves headlong into every possible alternative, run every experiment, test every option, break every barrier. Others conclude that we can discern the outlines of an objective moral code that best serves the welfare of human communities because it is best fitted to the way humans think and interact. What almost all unbelievers agree on is that no part of morality has been ordained, there being no entity in a position to do the ordaining. As for cosmology, unbelievers generally draw their cosmic outlooks from science, which says that our universe had a distinct beginning and predicts it will one day end. On the best available evidence, eternity is not in the cards. This brings us to what is perhaps the most fundamental difference between believers and unbelievers: whereas most traditional religious believers claim to attach primary importance to eternity, unbelievers necessarily attach primary—indeed, sole—importance to *this* life. Hence the sick anguish so many of us feel as we watch our believing fellow citizens throw away vast chunks of their only lives—lives whose very solitary and precioius finitude their faiths render them impotent to grasp.

Believers often have enormous difficulty "getting their heads around" the way unbelievers see the world—so much so that in countries as generally devout as the United States, it may seem convenient to deny that unbelievers actually exist in anything more than token numbers. By contrast, unbelievers seem to have less difficulty internalizing the believer's mind-set, perhaps because so many unbelievers were once believers themselves; in their lives they've seen both sides (I number myself in this group). Yet in reality, unbelievers exist in great numbers. Even in the pious United States, unbelievers form one of the largest identifiable minority groups. Around the world, despite the fall of "official" atheism in the Communist bloc, unbelief in all its forms continues to gain ground. No religion—not even Islam in its militant youth—has enjoyed sustained growth on the scope that unbelief has experienced since the turn of the twentieth century.[18]

Unbelief, I conclude, matters very much. Its contentions, its implications, and its history merit study. Its findings deserve respect and broader advocacy. If I have succeeded in my work as editor of this *New Encyclopedia of Unbelief*, I hope that it has done some small justice to the importance of its subject. Perhaps it will be a portal through which at least some believers can better come to understand how unbelievers see the universe. And perhaps it will aid in liberating a few more human beings from the seductions of misbelief.

NOTES

1. The most comprehensive prior works were Samuel Porter Putnam, *Four Hundred Years of Freethought* (New York: Truth Seeker Company, 1894); and George E Macdonald, *Fifty Years of Freethought*, 2 vols (New York: Truth Seeker Company, 1929). Both are widely cited by *New Encyclopedia* contributors writing on nineteenth- and early twentieth-century freethought, but they are limited by their focus on freethought, a significant "sect" within unbelief, but still only one sect.

ABBOT, FRANCIS ELLINGWOOD (1836–1903), American secularist and philosopher. A dissident Unitarian minister, Abbot argued for a scientific theism that he felt would strip away the superstitious hull and leave the spiritual kernel, a rational deity at home in a Darwinian world.

Early Life. Francis Ellingwood was born in Boston on November 6 to Joseph Hale, a schoolmaster, and Fanny Ellingwood Abbot. He attended Boston Latin School, graduated from Harvard University in 1859, and received a ministerial certificate in 1863 from Meadville Theological School in Pennsylvania. He married Katharine Fearing Loring in 1859; the difficult birth of a daughter in 1872 left her an invalid. Abbot's controversial dismissal in 1868 from a Dover, New Hampshire, pulpit for heterodox views—a decision sustained by the state supreme court—made him sensitive to the collusion of church and state.

Reform Career. Abbot's iconoclastic thought led inevitably to a break with Unitarianism, which he indicted as creed-bound. In 1867 he joined with other dissenters to found the Free Religious Association, an organization dedicated to creating a universal "Religion of Humanity." On January 1, 1870, he published the first issue of his anticlerical newspaper, the *Index*, in Toledo, Ohio (see PERIODICALS OF UNBELIEF). Relocating to Boston in 1873, Abbot issued "The Nine Demands of Secularism," the principles that guided the formation of the NATIONAL LIBERAL LEAGUE in Philadelphia on July 4, 1876. That pioneering freethought organization was dedicated to First Amendment guarantees of free speech and complete separation of church and state. Abbot, however, withdrew from the organization after its heated 1878 convention in Syracuse, over the league's blanket condemnation of the repressive Comstock Act (1873; see COMSTOCK, ANTHONY, AND UNBELIEF) and support of sexual reformers. An opponent of what was termed "free-love" (see FREE-LOVE MOVEMENT AND UNBELIEF), he created a rival organization, the National Liberal League of America (later the American Liberal Union). In 1881 he received a doctorate in philosophy from Harvard, where a decade later Josiah Royce sharply criticized his radical religious thoughts. On the tenth anniversary of his wife's death (October 23) and on the completion of a major manuscript (*The Syllogistic Philosophy*), he committed suicide by poison on her grave.

ADAMS, ROBERT CHAMBLET (1839–1892), Canadian freethinker. Robert C. Adams was born in Boston, Massachusetts, to a family that espoused fundamentalist Christian values common in that area at that time. His father was a preacher and Robert was a Sunday school teacher for a short time. Upon leaving school at age fourteen, he went to sea. For the next fifteen years, he rose from cabin boy to captain, traveled twice around the world, and visited many different countries. It was during this period that his religious beliefs came into direct conflict with his life experiences, and he began to have doubts about much of what he had been taught as a boy. Among other influences, he also read *The Age of Reason* by Thomas PAINE. A book about that part of his life is titled *On Board the Rocket.*

Around 1870 he settled in Montréal, Québec, Canada, where he became involved in several speculative developments, mining phosphate and mica in Ontario and silver and gold in British Columbia. Among other appointments, he was president of the Geological Mining Association of Québec and a director of the Sailor's Institute in Montréal. He married Mary Emily Job, who came from Liverpool, England. Politically he was a liberal, favoring free trade and Canadian reciprocity with (and even annexation to) the United States. During his time in Montréal, he consolidated his disbelief in religion. His SKEPTICISM stemmed primarily from the divergence he observed between what believers say and what they do. He became the president of the Montréal Pioneer FREETHOUGHT Club and was involved with the Montréal Secular Union.

He gave several public lectures, some of which were published, notably one titled "Evolution" (see EVOLUTION AND UNBELIEF) in 1883, in which he dealt with natural selection, and one titled "RATIONALISM" in 1884, in which he asserted that "[m]orality is independent of religion" and that "[t]he only cause is nature's laws." He also questioned the contribution of most believers to society, observing that such people seem to be opposed to almost everything except their own parochial views. But perhaps the best source of information about this freethinker is his autobiography titled *Travels in Faith: Tradition to Reason.* In it, he said, "Anyone who wishes to keep faith should not travel or read secular books." Another title, *Good without God*, was published posthumously by Peter Eckler of New York in 1902. After a relatively short but productive life, he died in Sedgewick, Maine.

GLENN HARDIE

ADDAMS, JANE (1860–1935), American social reformer. Cowinner of the Nobel Peace Prize in 1931 (with Nicholas Murray Butler), Jane Addams is best remembered for her association with Hull House, one of the first social "settlements" in the United States. Born in Cedarville, Illinois, Addams graduated from Rockford College in Rockford, Illinois, in 1881. She then entered Woman's Medical College in Philadelphia but had to leave because of ill health. After her recovery, she traveled extensively in Europe, and in London visited the Toynbee Hall "settlement." Impressed with its program, on her return she joined with Ellen Gates Starr to found Hull House in 1889 in the old Hull Mansion in Chicago. Originally conceived as a community center for the neighborhood poor, with many social reformers as residents, Hull House increasingly became a center for all kinds of reform. It became a model for other such settlements across the United States. Among other things a social activist, Addams was a leader in the woman suffrage movement (see WOMAN SUGGRAGE MOVEMENT AND UNBELIEF) and an active pacifist. She was chairman of the International Congress of Women at The Hague in the Netherlands in 1915, out of which arose the Women's International League for Peace and Freedom, of which she was the first president. She was the first woman president of the National Conference of Social Work (1910) and took an active part in the Progressive Party presidential campaign in 1912 with Theodore Roosevelt. She campaigned for social justice for immigrants, for Negroes, for labor, and agitated for the establishment of juvenile courts, tenement house regulation, and for the rights of women and children in every setting. In 1916 Addams urged aspiring publisher Emanuel Julius, about to marry her niece, Marcet Haldeman, to flout social convention by hyphenating his name with his wife's maiden name placed first; as Emanuel HALDEMAN-JULIUS he achieved fame as a pioneering FREETHOUGHT publisher.

Freethinking chronicler Joseph McCABE said Addams was reticent about expressing her religious views, careful not to alienate her religious supporters; yet her nephew J. W. Linn wrote in his 1935 biography of Addams that she never departed from the RATIONALISM that her father taught her, and that she joined the Congregational Church out of duty, as one might join a labor union. She also attended All Souls Unitarian Church in Chicago, a center of the emerging humanist movement (see HUMANISM) and was briefly an interim lecturer at the ETHICAL CULTURE Society in Chicago. Her funeral by her own specifications was nonsectarian.

She wrote two autobiographies, *Twenty Years at Hull House* (1910) and *The Second Twenty Years at Hull House* (1930). There is a vast collection of articles and books about her.

VERN L. BULLOUGH

ADLER, FELIX (1851–1933), German religious reformer. Felix Adler was the creator of ETHICAL CULTURE, a nontheistic religious movement that had its roots in the Jewish world. His early career coincided with the period of time when FREETHOUGHT and SECULARISM found wide support in intellectual circles and among some of the masses. His work was also contemporary with the rise of liberal Protestantism at the end of the nineteenth century. The new mainstream Protestant message ignored salvation and the afterlife and substituted the "social Gospel," with its emphasis on morality and social justice, as the heart of the Christian religion.

The end of the nineteenth century was also the time when emancipated German Jews in North America embraced radical Reform. This Jewish religious radicalism tossed most of traditional Jewish ritual into the dustbin of history and proclaimed morality the heart of religion. It also rejected Jewish ethnicity and parochialism and defined Judaism as a universal faith (see JUDAISM, UNBELIEF WITHIN). Having rejected traditional culture, the radical rabbis chose the music and lecture formats of the new liberal Protestantism.

Felix was born in Germany in 1851. His father, Samuel Adler, was a rabbi who joined the radical reformers. Since Germany after 1848 was not a comfortable place for political or religious radicals, Samuel immigrated to America, where he became the powerful leader of the Temple Beth El in New York, which later merged with the prestigious Temple Emmanuel. Educated in both the Columbia Grammar School and Columbia College, Felix was sent to the University of Berlin. Slated for the Reform rabbinate, Felix was also enrolled in the newly organized seminary for the training of liberal rabbis, the *Hochschule fur die Wissenschaft des Judentums*. This school was created by Abraham Geiger, Germany's most famous Reform pioneer. At the seminary Felix was confronted with the two dilemmas of Reform Judaism: If religion is essentially ethics, what difference does it make whether you think of yourself as religious or not, as long as you are ethical? And if Judaism is essentially universalistic, what is the point of preserving a particularistic Jewish identity?

Adler studied in a German intellectual environment

dominated by the ideas of the German philosopher Immanuel KANT. Kant had demonstrated that reason could not prove either the existence or the nonexistence of God. Only an absolute ethics could be reasonably demonstrated to be real. These affirmations of Kant would serve as a foundation of Adler's own philosophy of life. This worldly religion calling for social justice was to become the passion of the young Felix.

When Adler returned to New York he was invited to preach at Temple Emmanuel on October 11, 1873. His debut in the Reform pulpit was not a great success. He had moved beyond Judaism into the realm of a theological agnosticism. It appeared that the world of organized religion was not for him. With the help of the Jewish banker Joseph Seligman he was hired in 1874 by Andrew Dickson WHITE, the president of the newly formed Cornell University, to be a nonresident professor of Hebrew and Oriental literature.

But an influential group of German Reform Jews led by Julius Rosenbaum was inspired by Adler's message. They wanted to follow him into a new philosophical and religious adventure that would resolve the dilemmas of Reform Judaism and would break down the denominational barriers that prevented liberal people from uniting under the banner of ethics. Adler was persuaded to lecture about this possibility on May 15, 1876. Shortly after this talk the New York Society for Ethical Culture was founded. Most of its members were German Reform Jews. The movement that would emerge from this organization would be dominated by Jews for many decades. Some Jews thought of Ethical Culture as an extension of Judaism. But there was nothing about the official ideology that revealed any Jewish connection. Adler himself viewed Jewish identity as purely religious. Like most of his German Jewish contemporaries in America, Adler maintained that Jewish identity was only a matter of belief. To affirm Ethical Culture was to cease to be Jewish.

The name "Ethical Culture" was awkward in English. In German *Ethische Kultur* was a more felicitous phrase. But the puzzling name was irrelevant. Adler had found the path that would arouse his strongest passions, utilize his best talents, and provide him with the pleasures of fame and recognition. For the next fifty years Adler was on a fast train of achievement. He pioneered a new kind of religion, a religion without God. He became the leader of the Free Religion movement. He established the New York Society for Ethical Culture as a major voice for liberal ideas and social justice on the East Coast. He mobilized thousands of people for social action in the New York area. He created new schools for ethical education, which turned into his most lasting achievements. He taught ethics and philosophy to thousands of students at Columbia University (from 1902). He helped to create sister societies to the New York congregation in Chicago, Philadelphia, and St. Louis—even in Vienna.

He wrote many books that influenced the worlds of religious ideas and education. There were *Creed and Deed* (1877), *The Moral Instruction of Children* (1892), *Prayer and Worship* (1894), *An Ethical Philosophy of Life* (1918), and *Reconstruction of the Spiritual Ideal* (1924). All of them emphasized the following basic ideas: (1) Ethics is the heart of religion; (2) religion does not need God; (3) action is more important than belief; and (4) the human mind and its ethical aspirations are part of a spiritual reality that transcends the material world. Adler was close to HUMANISM and secularism. But he was not wholly comfortable with them.

Adler was not comfortable with MARXISM because it was too materialistic. He was not happy with Freudianism (see FREUD, SIGMUND) because it demeaned human motivation. He was not tolerant of conventional freethinking because it was too aggressively atheistic. There was at times something prudish, ethereal, and dogmatic about him as he hovered between the old world of religion and the new world of science and freedom.

Adler's death in 1933 was ironic. It was the year that Adolf Hitler came to power. The new anti-Semitism was to disrupt Ethical Culture and to inhibit its growth. Hitler restored Jewish ethnicity to the center of the Jewish world. The old universalism faded away. The Jewish population that had offered its allegiance and support to Adler's endeavors was now recruited to other enterprises. The old optimism yielded to fear and parochialism. Christian Unitarianism (see UNITARIAN UNIVERSALISM) was to pick up his message of ethics without God. Two decades later, Ethical Culture, the movement Adler founded, openly embraced ethical humanism.

SHERWIN WINE

AFRICA, UNBELIEF IN. Exaggerated notions of African religiosity are standard in African studies. Yet it is not clear in what sense the concept of religion applies to any aspect of African culture. There is, certainly, among the *generality* of traditional African peoples a belief in a supreme being. But it is arguable that this being is not conceived of as a creator ex nihilo, but rather as a divine architect of the *order* (as distinct from what, in some alien conceptual frameworks, might be called the sheer *existence*) of the world. Moreover, there is generally no such thing as an institution of God worship or an eschatology of eternal reward and punishment. Nor, connected with this, is there a priesthood entrusted with the moral and metaphysical guidance of its flock. Metaphysical enlightenment is left to native aptitude and wise conversation, while moral education is for the home. If belief in a supreme being in such institutional vacuum constitutes a religion, then it does so in a very minimal sense.

Even more important for our purposes here is the fact

that there were and still are religious skeptics in African traditional society. The African belief in the supreme being or God in the specified sense is one entertained by the generality of Africans, but not by all of them. Skeptics have been known in traditional culture. In the indigenous language of the present writer, Akan, they are called *akyinyegyefo*, literally, "those who question things or are given to disputing." They are not skeptics in the Western classical sense of doubting the very possibility of knowledge, but they are skeptics in the sense that they are apt to subject generally received beliefs to rigorous ratiocinative scrutiny, rejecting those that fail to hold up (see SKEPTICISM). Belief in God was one such object of scrutiny. So also was the belief in the continued existence of the ancestors and kindred spirits, of whom more below.

One knows the existence of such skeptics by direct personal experience. They live, move, and have their discourses in traditional society without let or hindrance, illustrating a milieu of free thought and expression that in the West was attained only with blood and tears. Until the late Kenyan philosopher Odera Oruka's *Sage Philosophy: Indigenous Thinkers and Modern Debate on African Philosophy* (1990), evidence for the claim that there are traditional skeptics was largely anecdotal. But in that book Oruka provided direct quotes from such thinkers in print. Here are some examples. They come from indigenous thinkers in Kenya that Oruka sought out and interviewed at length. One of them, Oruka Rang'inya, expresses himself as follows about God: "It is quite wrong to personalize him. He is an idea, the idea which represents goodness itself. God is thus a useful concept from a practical point of view." (This is Oruka's translation of taped remarks by Rang'inya.) This sage, as Oruka called him and others he interviewed, had no Western-style education, and it is just as unlikely that he borrowed this view from John DEWEY's notion of God as "the unity of all ideal ends arousing us to desire and action," which was expounded in his *A Common Faith* (1934), as that Dewey borrowed the concept from him.

Another of Oruka's sages, Simiyu Chaungo, remarks: "I think that God, in fact, is the Sun. . . . Well, the doings of the Sun are big. It heats the land all day, and its absence cools the land all night. It dries things: plants use it to grow. Surely, it must be the God we talk about."

For his part, Stephen M'Mukindia Kithanje explains, "When I try to have an idea of God, he appears to me as a mixture of heat and cold. When these two merge (fuse) there comes up life. . . . The act of fusion, which brings forth life, is what we call God. And that is what we mean when we say that God created the universe."

More straightforwardly atheistic is Njeru wa Kinyenje. In his opinion, Christianity is the white man's witchcraft. He comments, "This witchcraft has triumphed over the traditional African witchcraft. Today I recognize its *victory*, but not its *truth*. I do not pray to God nor do I consult witch doctors. Both religion and witchcraft . . . have no truth in them. My greatest wish is that I should be spared interference from religion and witchcraft."

The early practice in the study of African thought was to identify African philosophy with African folk philosophy. Because of this, the existence of the class of thinkers mentioned above was rarely noted. These thinkers were aware of the folk or communal thought of their societies. They knew, for example, that the folk cosmology is generally theistic, but in regard to their own thinking they had no qualms in following wherever the argument led, whether into theistic or atheistic waters.

It was noted above that African folk theism tends not to involve the notion of a creator ex nihilo. One reason, possibly the principal one, for this is that the concept of *existence* in at least many African languages includes a spatial contextualization. For example, in Akan, to exist is to *wo ho* (be there, at some place). According to the Rwandan philosopher and linguist Alexis Kagame, the peoples of the Bantu zone, who by his estimate occupy about one third of the African continent, render the concept of existence in an intriguingly similar manner. To exist is to *liho* or *baho*, to be there, at that place. The *ho*, exactly as in Akan, functions as an adverb of place. This spatial conception of existence has widespread reverberations in African metaphysical thinking. To take the question of creation out of nothing: If to exist is to be at some place, then *nothingness* will be a relative concept. "Nothing" can only mean the circumstance of there not being any item, as defined by a given universe of discourse, at some point of space. In that case *something* is logically prior to *nothing*, and the transcendental notion of creation out of nothing falls by the wayside. Incidentally, cognizant of this conceptual situation, an Akan metaphysician, certainly the present one, cannot be browbeaten in this matter with any faith-based (mis)interpretations of Big Bang cosmology.

The spatial conception of existence just commented upon is, in general, connected with a feature of African thought that might be called in broad terms empirical. As used here that word is only a characterization of the conceptual framework of African thought; what it means is that this framework of thought does not accommodate concepts that are not derivable from experience. It is easy to see that in this way of thinking the basic illusion of design can only yield a divine architect. But the empirical orientation could, conceivably, facilitate the avoidance of such a hypothesis too. And this happens, according to Okot p' Bitek, in the thought of the Central Luo in parts of Uganda and Kenya. There is, he says, no concept of a supreme being among them. In their language a question like "Who created the world?" is unintelligible. Despite this, in Christian missionary discourse a concept of God as creator of the universe was ascribed to the Luo, complete with the Luo name *Rubanga*. Okot

p' Bitek in his classic *African Religions in Western Scholarship* (1970) explains how this happened:

> In 1911 Italian Catholic priests put before a group of Acholi elders the question "Who created you?" and because the Luo Language does not have an independent concept of create or creation, the question was rendered to mean "Who moulded you?" But this was still meaningless, because human beings are born of their mothers. The elders told the visitors they did not know. But we are told that this reply was unsatisfactory, and the missionaries insisted that a satisfactory answer must be given. One of the elders remembered that, although a person may be born normally, when he is afflicted with tuberculosis of the spine, then he loses his normal figure, he gets "moulded." So he said "Rubanga is the one who moulds people." This is the name of the hostile spirit which the Acholi [a Luo people] believe causes the hunch or hump on the back. And instead of exorcising those hostile spirits, the representatives of Jesus Christ began to preach that *Rubanga* was the Holy Father who created the Acholi.

This may be amusing, but it is also instructive; it illustrates the superimposition during the colonial period of alien concepts on African thought structures, damn all the incongruities. *Religion* may be one such alien concept. Although, as noted above, African cultures generally feature a belief in some kind of supreme being, so that Luo a-theism is something of an exception, a foreign superimposition is responsible for an overloading of the concept of *African religions*. Christian missionaries described African religions as consisting mainly in the worship of a great assortment of spirits apart from God. These included the ancestors, lesser deities, and other, less glorious beings. And this has become among scholars a popular way of looking at African religions.

In fact, however, it is doubtful whether there is a word *or paraphrase* for either "religion" or "worship" in any indigenous African language. More decisively, the spirits in question are taken to be as much a part of the world *order* as human beings, for example. They are regarded in many cases as beings and powers that can be exploited to the advantage of humans if they know how. Evidently, the technique includes the use of flattery and offerings of all kinds. The procedures involved have been called *rituals* in the study of African religions. But the religious connotation of the word is open to question. These procedures are purely utilitarian. If the expected utility consistently fails to materialize, these alleged gods can be condemned to death. This certainly is how, as a rule, the African perceives the matter. The notion that these procedures are religious is much encouraged by the assumption that they involve a relationship with the supernatural. But this concept and the distinction between the natural and the supernatural that it presupposes carry any appearance of intelligibility at all only from Christian and like-minded Western points of view.

The term *spirit* also has proved conducive to the misunderstanding of African thought in relation to religion. In one sense it means an entity that is physical in terms of imagery but is exempt from the ordinary laws of motion and vision. Ghosts are spirits in this sense. They are supposed to be (very) occasionally perceptible, though they can apparently never be pinned down. If such entities exist, their existence can be discovered only by quasi-empirical cognition. Both African and Western cultures are replete with people who believe in the existence of such quasi-physical beings. Hopefully, the march of science will someday make that belief extinct. But *spirit* has another sense more resistant to scientific probing. It is the sense according to which a spirit is a nonextended, completely immaterial substance. This is what might be called the Cartesian sense of the concept of spirit. It is in this sense that René DESCARTES supposed that the mind or soul is spiritual. The struggle over the contradiction of how such a "substance" can reside in the material body is part of Descartes's legacy to Western thought. Africa is innocent of such a conundrum. If to exist is to be spatial, Cartesian spirituality is an incoherence. The claim, then, that African life is full of religious trafficking in *spiritual* things needs to be taken with at least a pinch of analysis.

So far we have discussed African belief or unbelief with respect to the oral tradition. There is a written tradition which will be commented on below. But it should be noted that the oral tradition has two layers, namely, the communal and the individualized. The worldview of the community is to be found at the communal layer, and the technical, speculative thought of individuals of an abstract inclination in the individualized layer. Of course, even the communal thought is the result of the discourse of individuals; it is what remains in the public memory, in an inevitably abridged and synthetic form, of the talk of remarkable individual thinkers in the community. And these are found in proverbs, poems, myths, and other media for preserving thought and information in an oral tradition. Oruka's skeptical sages belong to the individualized category, while Okot p' Bitek's account of Luo a-theism appertains to the communal. In Oruka's case the individualized reflections of the philosophical sages are captured and perpetuated in print. But there is also a traditional way of doing something similar. African talking drums have been used not only to disseminate information but also to communicate reflection. Among the Akans, for example, sage drummers have left philosophical riddles and epigrams in standardized forms that are quite appropriately called "drum texts." They are a perpetual challenge to analysis, interpretation, and evaluation. For another example, in the Yoruba system of Ifa Divination in Nigeria, there are vast numbers of such incentives to reflection.

Some of the Akan drum riddles are distinctly skeptical. Consider: "The creator created death, and death killed him." What does this mean? In Akan society one of the criteria of intellectual ability is being able to propose plausible interpretations of such texts. To the present writer the most plausible interpretation of this one is that the world order is defined by regular laws, that is, by indefeasible laws. This rules out immediately, for example, the idea of miracles. Such cosmic surds are ruled out, in any case, by the seamless African ontology in which, as previously hinted, there is no distinction between nature and supernature.

Or take another riddle. The supreme being is likened to a bagworm and it is queried whether it wove the bag before getting into it or got into it before weaving it. The contradiction in the first disjunct is plain: It couldn't have gotten into a nonexistent bag. But there is a contradiction in the first disjunct, too: If the bagworm wove the bag beforehand, then there was no bagworm to start with, and how does a nonexistent bagworm weave anything? In either case, therefore, there is a contradiction! The corresponding cosmological antinomy is this: Either God was somewhere when he created everywhere, or he was nowhere when he created everywhere. Given a spatial concept of existence, a contradiction follows either way. Intended lesson: It is conceptually ill advised to speak of creation (out of nothing).

An even better-known riddle is in the following drum verse.

Who gave word?
Who gave word?
Who gave word?
Who gave word to Hearing
For Hearing to have told the Spider
For the Spider to have told the Creator
For the Creator to have created things?

The question in this final riddle is: If the world was ever created by decision, then from what considerations or circumstances were the reasons derived? "Hearing" stands for understanding, conception, reasoning. The thought seems to be that it is circular to think of creation as a volitional act. Such an act would require purpose and in this case ingenuity, and a purpose already presupposes a causal order of objects and events. (Incidentally, the Spider, *Ananse*, is the hero of countless Akan folk tales, in which it represents ingenuity and originality. Indeed, God himself is sometimes called the Stupendous Spider, *Ananse Kokroko*.) Although Akan communal thought is theistic, albeit in a nontranscendental sense, this drum text, which is famous among the Akans, suggests, at best, some form of pantheism (see PANTHEISM AND UNBELIEF)—which, in plain language, is a kind of reverential ATHEISM. Presumably, this happens in all cultures. Abstract thinkers do not feel called upon to repeat communal commonalities.

This is even more evident in a written tradition of philosophy. The written tradition of philosophy in Africa, though it goes back to ancient Egypt, is not evenly spread over Africa. Ethiopia is perhaps the best endowed in this regard. The most illustrious philosopher of that country was a remarkable individual called Zara Yacob, a contemporary of Descartes. Both were ignorant of each other, though each placed his trust in reason. Yacob was, however, more uncompromising in his reliance on reason and was apt to declare various religious edicts, whether Christian or Islamic, absurd on grounds of irrationality. "God" he said, "does not order absurdities." Of course, what is absurd or otherwise was to be determined by each individual's reason. In Yacob's exercise of reason he came to the conclusion, for example, that the Muslim permission of polygamy could not possibly have come from God, since "it ruins the usefulness of marriage." Nor could the observance of the Sabbath be a commandment of God, "for our reason says nothing of the observance of the Sabbath." On the other hand, the Golden Rule is dictated by reason, and therefore any imperatives deducible from it are the will of God.

Zara Yacob did, however, believe in God on the basis of what he regarded as rational grounds. But though he cannot therefore be called an unbeliever, his RATIONALISM evidently rendered God logically superfluous to the foundations of morality. This, contrary to frequent suggestion, is generally the case in African indigenous thought. What is right is conceived as what conduces to the harmonization of the interests of the individual and the community. Any policing influence that the will of God or the ancestors or living elders might be thought to have on the conduct of those of a weak moral fiber is of a secondary significance in African ethics.

In North Africa there is an old tradition of written philosophy, but (outside of ancient Egypt) it is mostly Islamic. One might, of course, mention the contributions of Africans such as Origen, Tertullian, and Augustine to Christian doctrine. But that is far distant from unbelief. However, there is a lesser-known tradition of written philosophy in West and East Africa. Its manuscripts are only now being translated from the Arabic. But so far, it is Islamic and unskeptical. As for ancient Egyptian cosmology, it was subtle and intricate and defies brief accounting. At all events, however, one thing can be said: It had no use for the concept of a creator ex nihilo.

This discussion has been mainly occupied with the question of unbelief in traditional and historical Africa. In contemporary Africa, unbelief tends to be the result of de-conversion from one of the so-called world religions. Greater attention to indigenous African thought would probably reinforce that process.

AFRICAN AMERICANS AND UNBELIEF. According to every major poll on religion in the United States, African Americans are among the nation's most intensely religious minority groups. In August 2004 the Barna Group—a California-based consulting firm headed by Christian researcher George Barna—found that 91 percent of African Americans said they had prayed to God in the previous week. The comparable figure for Latinos was 86 percent; for whites, 81 percent; and for Asians, 46 percent. Fifty-nine percent of African Americans had read the Bible in the previous week. Among Latinos the figure was 39 percent; among whites, 36 percent; and among Asians, 20 percent. Forty-eight percent of African Americans said they had attended a worship service in the previous week. Among whites the attendance was 41 percent, 38 percent among Hispanics, and 23 percent among Asians. Blacks were also the group most likely to believe that the Bible was inerrant.

What, then, could be said about African Americans and unbelief? In truth, it would be odd if there were nothing to say on this topic. For despite African Americans' intense religiosity—or because of it—they have been historically at or near the bottom of every important quality-of-life indicator.

Despite their constant prayers, African Americans become sick more often and die far sooner than their counterparts in other groups. The supposed healing power of God obviously has no positive effect on the collective health and life span of African Americans. Though they only make up about 12 percent of the US population, African Americans make up 35 to 40 percent of those awaiting organ transplants. Blacks are generally twice as likely to die early as whites. Blacks have a life expectancy of seventy-two years, compared to seventy-eight years for whites. As talk show host Tony Brown says, "We lead in categories no one wants to lead in."

Biblical teachings profoundly influenced the enslavement of African Americans. Secular humanist William Sierichs Jr. explored the Christian origins of racism and the Christian defenses of slavery. Long before Sierichs, the great nineteenth-century freethinker Robert Green INGERSOLL pointed out that white men quoted the Bible in every phase of the slaves' experience—from the moment they were captured to the time they were sold.

The great abolitionist Frederick DOUGLASS said that religious overseers were generally the most brutal, despite the contradictory gentle messages of the Bible. Moreover, he remarked that he never had enough religion to prevent him from running away from slavery—and that atheism was preferable to the harsh Christianity of religious overseers.

Slaves must have experienced great cognitive dissonance. After all, the Bible taught them to be obedient to their masters (Eph. 6:5–6). On the other hand, though the "Good Book" says that masters must extend justice and fairness to their slaves (Col. 4:1), Luke 12:47–48 says that masters may beat their disobedient slaves with many lashes.

It must also have been difficult for slaves during the planning of rebellions. For example, though biblical teachings inspired Denmark Vesey to lead a major slave uprising, George Wilson and another religious slave betrayed him and told the master about the plot. It would be easy to deem these religious slaves traitors to their people. However, is not obedience to the word of God far greater than allegiance to mere mortals, regardless of the color of their skin?

There was also the problem of hunger. The Bible teaches that stealing is a sin. However, slaves often went hungry, and some would steal food from their masters. That is to say, in the cruelest sort of irony, they had to commit a sin against God in order to stay alive.

Because of these kinds of moral dilemmas, some slaves must have had doubts regarding the existence of God. In *Why, Lord? Suffering and Evil in Black Theology*, secular humanist scholar Anthony B. Pinn argues that black suffering cannot be reconciled with the notion of a perfect God. No doubt some slaves had to be of the same opinion.

In *By These Hands: A Documentary History of African American Humanism*, Pinn includes a short story in which a slave named James Hay rejects Christianity. In the same book, religious humanist William R. Jones persuasively argues that blacks come to HUMANISM for different reasons than their white counterparts. Whites generally embrace a humanist LIFE STANCE because they are attracted to Enlightenment ideals (see ENLIGHTENMENT, UNBELIEF DURING THE), revolutions in science (see RELIGION IN CONFLICT WITH SCIENCE), philosophy, and so forth. However,

black unbelievers, Jones contends, find themselves in a state of oppression and cannot make sense of their plight by believing in the God of Christianity.

African American unbelievers exist, and some of them have made enormous contributions to the arts, intellectualism, activism, and numerous other areas of human endeavor. Moreover, they have had a tremendous impact upon the ideas and actions of religious people throughout the world.

However, organized humanism, ATHEISM, or FREETHOUGHT among African Americans has been rare. Aside from the national organization African Americans for Humanism (AAH), a project of the Council for Secular Humanism, there has never been a well-known, concerted national effort to bring African Americans into organized humanism. Furthermore, there have been few major efforts among African American unbelievers to organize among themselves.

That during the history of organized freethought some influential white unbelievers were thoroughly racist certainly did not help matters. Some leading mid-twentieth-century white freethinkers wrote and spoke disparagingly against black people. James Hervey JOHNSON, the former editor of *THE TRUTH SEEKER*, and essayist Woolsey TELLER were among the worst offenders. In 1945 the Truth Seeker Company published Teller's *Essays of an Atheist*. Teller wrote five especially racist essays: "Grading the Races," "Brains and Civilization," "There Are Superior Races," "Shall We Breed Rationally?" and "Natural Selection and War." In "Grading the Races," Teller discusses an essay by the African American atheist and historian John G. Jackson (1907–93) called "Ethiopia and the Origin of Civilization." Teller calls Jackson "a mulatto" and argues that "the ancient Egyptians were dominantly Caucasian." Moreover, he argues that the "Caucasian skull, anatomically considered, is the highest in the world." In "Brains and Civilization" Teller compares the brains of the "White Race," the "Yellow-Brown Race," and the "Black Race." (Apparently, these are the only "races" he recognizes.) He again concludes that the brain of the white race is larger, with more convolutions than the brains of the other two inferior races. In "There Are Superior Races," the writer dismisses the notion of biological equality among the races. He claims that there is an "aristocracy of brains" that favors the white race. However, he also argues that whites have maintained "cultural supremacy." In "Shall We Breed Rationally?" Teller argues against "miscegenation." He is especially concerned that whites not breed with the lower races. In "Natural Selection and War" he refers to himself as "a Darwinian" (see DARWINISM), and defends "natural selection as an operative factor throughout the organic world." In the name of RATIONALISM he argues in favor of white supremacy.

Despite the racism some influential white freethinkers displayed, some blacks were still attracted to freethought, and others were deeply influenced by it. The great freethinker and black intellectual giant Hubert H. HARRISON wrote for *The Truth Seeker*. John G. Jackson became an influential member of American Atheists. He began writing for *The Truth Seeker* in 1930. He lectured on African history at the Ingersoll Forum in New York for several years. Furthermore, he lectured in universities throughout the northeastern part of the United States.

A. Philip RANDOLPH and Chandler Owen were attracted to freethought and wrote strong critiques of religion. The historian and anthropologist Joel Augustus ROGERS came under the sway of freethought, as did Claude MCKAY and the black conservative George S. Schuyler.

Jackson and Rogers wrote numerous books to combat the racist onslaught from writers such as Teller. The February 1987 issue of *American Atheist* featured "Atheists of a Different Color." Many African American street vendors and bookstores throughout the United States still sell photocopies of this issue. The issue features biographical information on Rogers, Randolph, Jackson, Schuyler, and others. There are also writings on two of the leading Afrocentric scholars: Yosef A. A. ben-Jochannan (aka Dr. Ben) and the late John Henrik Clarke.

Clarke and Dr. Ben were associates of Malcolm X, and might have influenced his thinking, as did the works of Rogers. Clarke and Dr. Ben believed that Islam and Christianity were highly detrimental to people of African descent. Indeed, in 1984, during Jesse Jackson's historic run for president, Minister Louis Farrakhan of the Nation of Islam (NOI) referred to Judaism as it was practiced by white Jews as a "gutter" religion (according to some reports, the actual words were "dirty religion"). Farrakhan and his apologists tried to rationalize the statement. However, Dr. Ben—a nominal Ethiopian Jew—stated that Farrakhan was absolutely correct to speak of Judaism in this way. He simply wished that Farrakhan had included Christianity and Islam along with his denunciation of Judaism. As far as he was concerned, they are *all* gutter religions.

Dr. Ben and Clarke wrote and spoke about the prebiblical origins of Judaism, Christianity, and Islam. Indeed, much Afrocentric thought centers around the human origins of these three world religions. Afrocentric scholars pointed out the remarkable similarities between the wisdom, philosophy, theology, religious practices, and moral ideas in the religious texts of Judaism, Christianity, and Islam, and those found among the ancient Egyptians and other civilizations. For example, Clarke used to say that if Moses came down from the mountain with the Ten Commandments, it was only because he carried them up the mountain with him in the first place. Clarke taught that long before the Hebrews had the Ten Commandments, the Egyptians had the "Negative Confessions," the "Declarations of Innocence" in the Book of the Dead, and the Book of Coming Forth by Day into

Night. Examples of the declarations included "I will not commit murder," "I will not steal," "I will not commit adultery," and the like.

Dr. Ben would say, "Heaven is between a Black woman's thighs." That is to say, the black woman not only gives sexual pleasure, but the first women probably came from sub-Saharan Africa and gave birth to our ancestors. For that reason, he said, "the Black woman is the only God we know. Everything else is just our opinion."

Black militants such as those from the NOI presented harsh critiques of Christianity, leading some African Americans to embrace freethought. Many black militants denounced Christianity as a white man's religion. They pointed out that white Christians enslaved and oppressed black people in the name of Christ.

Members of the NOI were especially critical of Christ's command to turn the other cheek. As blacks were turning the other cheek, white racists were beating and killing them. NOI members found this kind of hypocrisy unacceptable and detrimental to the survival of black people. Some blacks, however, reasoned that if Christianity is false, many of the theistic claims of the NOI must also be false, and that all theistic truth claims are dubious.

The Harlem Renaissance was especially critical in the history of black humanism. Indeed, this was a deeply humanistic movement. During this creative period, Nella Larsen wrote the humanistic/atheistic novella *Quicksand*. In this story, Larsen compares religionists to rapists. Helga, the central character, is forced to edify blind faith in God's representatives on Earth (i.e., Christian ministers). However, in the end Helga rebels, angrily rejects theism, and understands that theism has been used historically to oppress black people in the United States.

In 1923 Jean Toomer wrote *Cane*, considered by many to be the greatest literary masterpiece of the Harlem Renaissance. It is a brilliant collection of poems, sketches, and stories about black life in the United States. In his poem "Cotton Song," Toomer repeatedly advises his people not to wait for Judgment Day. He advocates human action and hard work. Humanistic themes permeate *Cane* and give the novel its vibrancy and power. Toomer was not only concerned with racial issues; he studied atheism, naturalism, history, biology, psychology, and many other subjects. He once heard a lecture by the agnostic Clarence DARROW that destroyed his faith in a universe run according to God's immutable laws. In the story "Kabnis," Toomer compares Christian preachers unfavorably to buzzards. The character Kabnis considers them ignorant and arrogant. He complains that blacks are a "preacher-ridden race," controlled by black preachers who are in turn controlled by whites. Another character, Layman, says *all* preachers are parasites. He says that the church is filled with sinners and obnoxious hypocrites.

The freethinker James Weldon Johnson was one of the most productive writers of the Harlem Renaissance. Johnson was a lawyer and served as US consul at Venezuela and Nicaragua from 1906 to 1913. He was the secretary of the NAACP from 1920 to 1930. Johnson wrote *The Autobiography of an Ex-Coloured Man* in 1912. It is published anonymously, but was republished with attribution in 1927,when the Harlem Renaissance was at its zenith. It was considered to be the first first-person novel ever written by a black. The book became a sensation. It is narrated by a man who has the ability to "pass" for white, and who struggles with his racial identity. Ironically, Johnson, an avid reader of agnostic orator Robert Green Ingersoll, was also famous for writing a book called *God's Trombones*, as well as "the Negro National Anthem," called "Lift Every Voice and Sing." Johnson vied with W. E. B. DU BOIS for recognition as the most accomplished African American of his day.

In 1929 Wallace Thurman wrote *The Blacker the Berry*. . . . The novel is a satire about a dark-skinned black woman victimized by intraracial bigotry. However, most people—including scholars and intellectuals—still believe the story is to be taken seriously. It was one of the most widely read black novels of its day, and is still required reading in many Black Studies departments.

Sterling Brown was a major Harlem Renaissance poet. His poem "Slim in Hell" beautifully and hilariously explores racism in the Deep South. A black man named Slim Greer dies and goes to heaven. Saint Peter greets him, gives him angel wings, and tells him to report on what is happening in hell. He then will be permitted to stay in heaven. Slim cannot tell the difference between hell and Dixie, and winds up getting the surprise of his life.

There have been important black humanist writers and thinkers since the Harlem Renaissance. In 1973 the aforementioned philosopher William R. Jones of Florida State University wrote a book titled *Is God a White Racist? A Preamble to Black Theology*. Jones argued that the claim that God cares about black people must be supported by strong evidence. Otherwise, it could be persuasively argued that God is a white racist, considering the ongoing plight of black people. Jones described himself as a human-centered or "humanocentric" theist. Others have described him as a "religious secular humanist." He had a close relationship with the Unitarian Universalist Church (see UNITARIAN UNIVERSALISM), an institution that has embraced liberal and radical theists, deists, agnostics, Wiccans, atheists, secularists, freethinkers, rationalists, naturalists, and others. Jones was highly critical of the leading humanist Paul Kurtz, claiming that Kurtz had abandoned the ideals of SOCRATES. (Kurtz has always denied the charge.) In 1989, shortly after the founding of African Americans for Humanism, this writer met with Jones and other black Unitarian Universalist ministers at historically black Howard University in Washington, DC. Though Jones signed African Amer-

icans for Humanism's African American Humanist Declaration, he had reservations about the document. He believed that its emphasis upon black self-help was tantamount to "blaming the victim," and succeeded in persuading the other ministers in attendance to share his concern. After the meeting, Jones attacked the declaration again and ceased contact with AAH. Jones shared his "grid of oppression" with humanist and nonhumanist audiences. He argued that powerful whites had control of all of the most important institutions in America, and that consequently, blacks were powerless to effect meaningful change by themselves. He was obsessed with government intervention as a means for significantly improving the lives of blacks.

Like James Cone and other black scholars, Jones argued that the blues is a nontheistic art form. Unlike the spirituals, it does not call upon God to address racism and oppression. Moreover, the black church and Jesus Christ are equally unimportant in this musical genre. Not surprisingly, many—if not most—staunch black religionists opposed the blues. They referred to the tunes as "devil songs," and warned people about their allegedly corrupting influences. In *Why, Lord?* Pinn notes that blues musicians often dealt with themes that many black religionists found embarrassing. He further contends that the blues presented challenges to important religious ideas, dealing critically with Christian hypocrisy and quietist ideas. Some blues songs even questioned the existence of God.

Jones opposed the attempts by black religious scholars to construct one monolithic religious model for African Americans. He believed that while it was important to recognize the Christian tradition in black culture, there was also a nontheistic black tradition that had to be recognized and studied.

Though white humanists and black humanists have much in common, Jones believed that blacks and whites arrive at a humanist life stance for different reasons. Most white humanists consider themselves children of the Enlightenment; according to Jones, most blacks embrace humanism as a result of contemplating black suffering in a racist world. That is to say, black humanism is firmly rooted in the black experience. Therefore, it is erroneous to claim that black humanists have been simply tricked into accepting a Eurocentric worldview.

Jones believed that one of the main functions of black humanism is to challenge the popular notion that black Christianity is necessarily authentic. Much of black Christianity—if not most of it—is simply copied from the Christianity of white oppressors. Therefore, the black humanist must challenge "black" Christianity, because it often aids and abets black oppression. In this way, black humanists are doing the important work that black theologians are unable or unwilling to do.

Linton Kwesi Johnson is one of only two living poets to have work published in the Penguin Modern Classics series. He was born in Jamaica on August 24, 1952. He attended Goldsmith's College, University of London, and eventually joined the Black Panthers (see CLEAVER, ELDRIDGE). Having read *The Souls of Black Folk* by W. E. B. Du Bois and deciding to become a poet, he joined a group of poets and drummers. The journal *Race Today* published his first poetry collection, *Voices of the Living and the Dead*, in 1974. His second anthology, *Dread Beat An' Blood*, was published the following year. Virgin Records released a record of the same name in 1978. Johnson has gone on to produce many more records and has received numerous awards. His biggest audience consists of Jamaican immigrants in Britain. In the 1970s his poetry was intensely political and focused on racism and injustice. Johnson attended a Baptist church in Jamaica as a child, but asked difficult questions, earning him stern words from his pious grandmother. When he moved to Britain at age eleven, he attended a Methodist church and sang in the choir. Johnson began to doubt religion after reading *Capitalism and Slavery* by Eric Williams. He learned that religion was essential in the enslavement of black people. He learned that Spaniards and Portuguese Catholics had agreed to divide and conquer Africa. Moreover, he learned that Wesley of the Methodist Church was a slavery advocate. In college, he read MARX and was further convinced that religion enslaves the masses. After discovering Rastafarianism, Johnson moved toward AGNOSTICISM. Though he embraced black consciousness, he never accepted the NOI. The Panthers strongly opposed the NOI's reactionary black nationalism and its racialist theology. Moreover, the NOI had assassinated Malcolm X, and that, for Johnson, confirmed its moral bankruptcy. Johnson discovered that, contrary to popular opinion, many of the atheists he met were good people. Conversely, many of the Christians he had known were "hypocrites." Today he embraces a humanist life stance and continues to write poetry and give performances.

Two black women have been selected "Humanist of the Year" by the AMERICAN HUMANIST ASSOCIATION (AHA)—Alice Walker and Faye Wattleton. Walker won the Pulitzer Prize for *The Color Purple*. Anthony Pinn includes a chapter on Walker in *By These Hands*. The essay is titled "The only reason you want to go to heaven is that you have been driven out of your mind." It begins with Genesis 3:16, in which the reader is informed that God has cursed "the woman" with servitude to her husband. Walker bemoans the fact that so-called men of God often worship a God of sexism and violence against women. She is critical of the blond, blue-eyed Jesus and prefers to worship the earth. She says that too many people love and worship a God that does not love and worship them in return. Wattleton is the past president of Planned Parenthood Federation of America (1978–92). She is a brilliant debater and forthright defender of sex education and reproductive rights, aiding in the implementation of family planning programs in numerous

developing countries. In 1989 this writer contacted her and asked her to become involved with AAH. Though she applauded the humanist group's efforts, she declined the offer to join. She had already received numerous death threats in her capacity as the head of Planned Parenthood, and she thought it unwise to become an easier target by becoming a member of an openly humanist organization. In 1993 Wattleton was inducted into the National Women's Hall of Fame. Today she is the president of the Center for the Advancement of Women. In 2005 she was a spokesperson at "The State of the Black Union: Road to Health and Defining the African American Agenda" at New Birth Missionary Baptist Church in Lithonia, Georgia. The one-day symposium, carried live by CSPAN, featured such luminaries as Minister Louis Farrakhan, Rev. Jesse Jackson Sr., Cornel West, Rev. Al Sharpton, Michael Eric Dyson, and many others.

African Americans and Organized Humanism. It should be absolutely clear that unbelief has had a profound impact upon African American intellectualism, activism, life, and culture. However, as previously noted, there have not been many successful efforts at *organized* humanism, freethought, atheism, and the like among African Americans.

In his heyday, Hubert H. Harrison headed a small group of atheists in Harlem. However, he was the only black member in the group. In the late 1980s and early 1990s, a man named Al Brown headed the Afro-American Atheist Association in Florida, but it consisted of only Brown and one other person. In the mid-1990s, Eugene Charrington of Brooklyn headed the Harlem Atheist Association. That group did not have many members, and eventually disbanded. There was a vibrant chapter of African Americans for Humanism associated with the former Center for Inquiry–Midwest in Kansas City, Missouri. However, the center no longer exists.

There was also an attempt by little-known Northern California hip-hop artists to popularize humanism through music. Furthermore, there have been similar attempts by big-name hip-hop artists. KRS-One, a major rapper during the late 1980s and early 1990s, promoted a conception of religious humanism. However, his conception of humanism was homophobic. In any case, it did not catch on with his fans. In Portland, Oregon, a hip-hop group called Lifesavas rejects religion and promotes a secular worldview. They believe in drawing upon their inner human strength to find solutions to the world's problems. Yet they do not try to force their views on their listeners in a preachy way.

There have been other attempts to attract large numbers of blacks to organized humanism, all to no avail. However, freethought hope springs eternal. Reginald Finley, who helms an Internet radio show as the Infidel Guy, is a former "psychic." He and his wife worked for a psychic hotline and persuaded many callers that they possessed psychic powers. He shared some of his secrets at a Center for Inquiry conference in Atlanta in 2001. He hosts a Web site that attracts many black freethinkers, and he has traveled to different US cities promoting freethought among African Americans.

By far, AAH is the organization in the best position to promote organized humanism among people of African descent. Headquartered near Buffalo, New York, since 1989 AAH has had representatives on major programs in the US media, at institutions of higher learning, and in newspapers and other print media. Today, local AAH groups operate in Harlem and in Albany, New York. There are currently plans to start one in the Washington, DC, area and to eventually branch out into other US cities.

In Albany, McKinley Jones and Taunya Hannibal-Williams are engaged in an ambitious effort to explore and document the role of humanism in the civil rights movement. They will tap into law, literature, the arts, social science, and political science. Ultimately, they would like to make course materials available and give lectures, exhibits, and presentations.

Ironically, perhaps the best model for organized humanism and freethought for blacks comes from Africa. Some forty-five humanist and freethought groups exist in Congo, Ghana, Kenya, Guinea, Gambia, Uganda, Rwanda, Zambia, Liberia, Nigeria, Cameroon, Ethiopia, Tanzania, South Africa, and Sierra Leone.

AAH helped form the African Humanist Alliance, an organization of African humanist groups that now operates with great support from the INTERNATIONAL HUMANIST AND ETHICAL UNION (IHEU), headquartered in England. The alliance plans to have at least one humanist group in all fifty-three African nations.

The Nigerian Humanist Movement—headed by Leo Igwe of Ibadan, Oyo State, Nigeria—received strong words of encouragement from Nobel laureate Wole Soyinka in 2001. In October of that year, the Nigerian Humanist Movement and the Council for Secular Humanism cohosted the first major humanist conference in sub-Saharan Africa. Soyinka, also a laureate of the International Academy of Humanism, sent a letter to be read at the conference. He acknowledged the importance of humanism in Nigeria and discussed the importance of SECULARISM.

Soyinka has long been an outspoken advocate of secularism. He has defended Salman Rushdie, Taslima NASRIN, and other alleged blasphemers (see BLASPHEMY). Moreover, he has been imprisoned and threatened with death many times for calling for democracy in Nigeria. He dedicated his book *The Open Sore of a Continent* to the outspoken atheist, educator, humanitarian, and prodemocracy activist Tai SOLARIN. In November 2001 Soyinka was the keynote speaker at the Center for Inquiry's conference "Science and Religion: Are They Compatible?" The Council for Secular Humanism presented him with the Distinguished Humanist Award.

The Committee for the Scientific Investigation of Claims of the Paranormal (CSICOP) is also affiliated

with the Center for Inquiry. The work of CSICOP is of great interest to African humanists. Most African humanists are combating juju, ritual killings, and other paranormal phenomena. CSICOP provides rational explanations for these kinds of beliefs and actions.

There is also interest in humanism in the Caribbean. In the earlier part of the twentieth century, many Jamaican humanists belonged to the RATIONALIST PRESS ASSOCIATION, based in Britain. In the 1990s there was a humanist group in Haiti. Today, AAH has plans to help start a group in Barbados.

If more black unbelievers would come out of the closet, much greater progress could be made in attracting larger numbers of blacks to organized unbelief. However, whereas religionists loudly and proudly acknowledge their religious beliefs—no matter how bizarre they might be—most unbelievers prefer to keep their unbelief hidden. It is hoped that this encyclopedia will encourage more unbelievers to become part of a great and proud legacy.

Moreover, humanist and freethought leaders must do more to take into consideration differences in class and culture between whites and blacks. As this volume makes clear, different people—and different groups—come to unbelief for different reasons. For example, the AAH group in Kansas City attracted large numbers of blacks by featuring jazz, blues, soul food dinners, and poetry. For unbelief to grow, it cannot appeal only to scholars and well-read educated intellectuals.

Race, ethnicity, or geography will never restrict the development of humanism, atheism, freethought, and rationalism. As long as people think for themselves, there will be freethinkers. Moreover, there will always be courageous efforts—somewhere—to bring them together for a shared sense of community.

AGATHONISM. Agathonism is a system of humanistic ethics devised by the philosopher Mario Bunge that balances duties with rights and centers around what is good. Agathon (c.450–400 BCE) was an Athenian tragedian, but *agathon* is also the Greek word for "good," and it is in this context that Bunge uses the word. Agathonism is a refinement of the Golden Rule, which has served as a moral maxim to virtually every system of belief ever devised. Despite its ubiquity, some philosophers have detected logical problems with the Golden Rule. For instance, is it right for a masochist to inflict pain on others because he might want pain inflicted on him? Bunge has devised the notion of agathonism as a reliable method for determining humanist ethics. The two base postulates of agathonism are as follows:

1. Whatever contributes to the welfare of an individual, without jeopardizing the basic rights of any others, is both good and right.
2. Everyone has the right to enjoy life and the duty to help others enjoy life.

Agathonism can be simplified to the maxim "Enjoy life and help live an enjoyable life." Agathonism is specifically realist and materialist and thus can be employed in the real world. It balances selfishness and altruism and places a premium on the moral equality of people and on the principle of fairness. In addition, its simplicity makes it accessible to everyone. Agathonism has the intellectual clarity and humanitarian simplicity to become the foundation for any humanist ethics.

AGNOSTICISM. Agnosticism is an epistemological term (from the Greek *agnosis*, meaning "without knowledge") that connotes a form of SKEPTICISM concerning the existence of God. According to agnosticism, the existence of God is unknowable, either because this metaphysical claim lies beyond the reach of human cognitive faculties, or because neither the evidence for nor the evidence against the existence of God is epistemically superior. For these reasons, agnosticism normally involves a suspension of belief concerning God's existence as well.

Origin of Agnosticism. Historically, Thomas Henry HUXLEY is credited with coining the term *agnostic* in 1869 CE in order to distinguish his view from ATHEISM and theism. In his undergraduate years, Huxley had read from the texts of the ecclesiastical sect known as the Gnostics, a group famous for claiming to possess fundamental knowledge of the universe. To separate his position from the dogmatism of the Gnostics, Huxley adopted the term *agnostic* to emphasize his lack of knowledge and to endorse a cautious methodological modesty in his approach to answering the question of God's existence. Accordingly, he wrote: "[I]t is wrong for a man to say that he is certain of the objective truth of any proposition unless he can produce evidence which logically justifies that certainty. This is what agnosticism asserts and, in my opinion, is all that is essential to agnosticism . . . the application of the principle results in the denial of, or the suspension of judgment concerning, a number of propositions respecting which our contemporary ecclesiastical 'gnostics' profess entire certainty."

Huxley gave serious weight to the appraisal of evidence for God's existence, and claimed that the inability to provide sufficient justification for belief in God should result in suspension of judgment. Although he suggested that the existence of God may reach beyond our cognitive faculties and is unknowable, Huxley also doubted that he knew this to be the case, that rather, such a matter is probably unknowable. Thus, paradoxically, Huxley is "agnostic" about his own agnosticism.

Interpretations of agnosticism began to diversify in the decades after Huxley before reaching their pinnacle of ambiguity in philosophy of religion today. For example, in the late 1800s the famous Scopes trial attorney Clarence DARROW, a self-proclaimed agnostic, wrote: "An agnostic is a doubter. The word is generally applied to those who doubt the verity of accepted religious creeds or faiths. . . . Anyone who thinks is an agnostic about something, otherwise he must believe that he is possessed of all knowledge. And the proper place for such a person is in the madhouse or the home for the feeble-minded." Darrow seems to have given teeth to Huxley's cautious methodological modesty; however, this haughty interpretation of agnosticism is scarcely found in the twentieth century.

Contemporary Agnosticism. Modern agnosticism naturally overlaps many elements of the Huxleyan agnosticism discussed above, however imprecisely it is defined in common usage. Upon survey one will find that those who consider themselves agnostics may differ significantly in their views with respect to methodology of inquiry, the conditions for justification of belief, and the limits of knowledge. Strictly speaking, there is no orthodox interpretation of agnosticism; no single set of necessary and sufficient conditions for agnosticism can be articulated. What follows is a concise yet broad mapping of the landscape within agnosticism.

First, in its weakest sense, agnosticism may be attributed to someone who merely professes personal ignorance with respect to the claims that God does or does not exist. This form of agnosticism is quite popular among the general population. It clearly emphasizes Huxley's methodological modesty; however, it arguably goes too far. Those who are intellectually lazy, failing to seriously inquire into the evidence presented for and against God's existence, nonetheless help themselves to a lofty title. While it is true that such agnostics suspend belief, a common component of many versions of agnosticism, their suspension is due to cognitive lethargy. Therefore, perhaps critics are fair in pointing out that such people are deserving of no title at all.

A second, stronger form of agnosticism may be attributed to those who claim that the existence of a deity is unknowable due to a balance of evidence (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). According to the parity agnostic, the evidence for and against God's existence is sufficiently balanced such that neither belief nor disbelief is epistemically preferable. Given the parity of evidence resulting in suspension of belief, knowledge is taken to be unattainable. While parity agnosticism vaguely expresses a widely held opinion that both theism and atheism each have plausible considerations in their favor, it is up to the parity agnostic to show us exactly how this evidence is so nicely balanced. If the arguments on one side are even marginally superior to those on the other, the parity agnostic must answer why suspension of belief is preferable to a diffidently held belief or disbelief.

Third, a close relative to the parity agnostic known as the *sans*-evidence agnostic maintains that there is no evidence for, as well as no evidence against, the existence of God. Since there is no evidence for either side, alleges the *sans*-evidence agnostic, neither belief nor disbelief is adopted. Just as with the parity agnostic, a balance of evidence must be shown, but in this case there must be close to zero evidence for each side. Many inquirers will find it difficult to accept that both theists

and atheists have absolutely nothing persuasive in defense of their respective views, and this relegates the *sans*-evidence agnostic to an uncomfortable position. If adopted, both the parity and *sans*-evidence strands of agnosticism are no longer seen as a third, more modest alternative to theism and atheism. Huxley's methodological modesty has been abandoned, although the latter two versions of agnosticism are certainly innocent of intellectual laziness.

Fourth, some agnostics focus on the unknowability of the metaphysical claims to God's existence or nonexistence, but allow that belief or disbelief is nonetheless permissible. It is important to note that this interpretation of agnosticism is compatible with theism or atheism, since it is only asserted that *knowledge* of God's existence is unattainable. This agnosticism is also compatible with both a modest and an immodest methodology. For example, agnostics such as Leslie D. Weatherhead can believe in the existence of God, yet acknowledge limitations of our cognitive faculties. He writes: "But surely, in so many matters, a reverent agnosticism is the only place where the Christian can rest his mind, remembering that the gap between a child's comprehension and his father's activities is nothing compared with the gap between wisest man's understanding and the scope of God's activity."

Weatherhead and other theistic agnostics may often emphasize the inability of humans to know of God's existence, for this condition of ignorance leaves ample room for religious faith. Agnosticism of this flavor may be referred to as a fideistic agnosticism. Immanuel KANT is a comfortable fit for this category. While Kant expressly denies metaphysical knowledge of many sorts, including of God's existence, he elects to postulate the existence of God to make sense of our moral experience.

Alternatively, one might agree with Kant and Weatherhead that knowledge of God's existence is unattainable, yet disbelieve in the existence of God. Atheists may seize upon the opportunity to count these agnostics as atheists so long as atheism is broadly construed to include everyone who is not a theist. If the label *atheist* simply means not a theist, just as *amoral* means not moral and *atypical* means not typical, then the set of atheists is much larger that one might have thought. However, this imperialistic tendency ought to be resisted. Those preferring the appellation of agnostic in this case may be doing so because they prefer to emphasize the limitations of knowledge, rather than to highlight their disbelief, which often is taken to have a negative stigma.

Contemporary thinkers favoring a form of philosophical NATURALISM that is thoroughly dismissive of metaphysics altogether may be atheistic agnostics of this sort. Such naturalists may claim that knowledge of metaphysical claims is unattainable, yet still disbelieve in the existence of God. To some it might seem inconsistent to shun metaphysics yet advocate the metaphysical belief of God's nonexistence in one's next breath. Thus, it appears that the naturalists' views are self-contradictory.

However, though it is a metaphysical claim to deny the existence of deities, it seems unreasonable to expect the naturalist to suspend belief in these cases rather than disbelieve. This unreasonableness is clearly seen when we emphasize that agnosticism often connotes a middle ground between belief and disbelief. It is often a position held because neither side is more reasonable than the other. Thus, the naturalist may point out that it would be odd for someone to be agnostic about belief in the existence of Zeus; maybe Zeus exists, maybe not. So, even though the naturalist admits that knowledge of Zeus's nonexistence is unattainable, this does not commit the naturalist to a suspension of *belief*. It is open for the naturalist to claim that belief in Zeus, or any other deity, arises from normatively problematic belief-forming processes. Thus, it is far from clear that an atheistic agnosticism arising from a philosophical naturalism is self-contradictory.

One additional version of agnosticism that focuses on the unknowability of the claim that God exists is one that is conjoined with neither belief nor disbelief. Instead, agnostics of this sort are skeptics with regard to knowledge of God's existence, but also insist that one must suspend belief as well. David HUME, for instance, is notoriously hostile toward metaphysics. Famously, he wrote: "If we take in our hand any volume; of divinity or school metaphysics, for instance; let us ask, *Does it contain any abstract reasoning concerning quantity or number?* No. *Does it contain any experimental reasoning concerning matter of fact and existence?* No. Commit it then to the flames: For it can contain nothing but sophistry and illusion."

However, Hume, unlike Kant, seems to advocate that one must suspend judgment. Although Hume sometimes concealed his views by writing in dialogue form, a notable exception is found in the concluding words of his *The Natural History of Religion*: "The whole is a riddle, an enigma, an inexplicable mystery. Doubt, uncertainty, suspense of judgment appear the only result of our most accurate scrutiny, concerning this subject." Hume can be plausibly interpreted as representing a form of agnosticism containing a mixture of several elements already mentioned. He shares an opposition to metaphysics alongside Kant and contemporary naturalists, yet he advocates neither belief nor disbelief. His comments echo some of the claims of the parity and *sans*-evidence agnostics when he concludes that suspense of judgment is the "result of our most accurate scrutiny, concerning this subject."

To conclude, it should be apparent that agnosticism is employed in many different ways. When approaching an agnostic in public, it might be useful to ascertain whether such a person is an agnostic of the aforementioned weak variety, for if so it is unlikely that a worthwhile conversation will ensue. But if the agnostic is claiming more than just personal ignorance due to cog-

nitive lethargy, then one will have to discover what position is taken with respect to the evidence for and against the existence of God. Does the agnostic think the evidence is balanced? Is there no good evidence for or against God's existence? And furthermore, one will need to determine what the self-proclaimed agnostic thinks with respect to the possibility of knowledge of God's existence. And even if such knowledge is not possible, it is still open as to whether or not belief is permissible. Some agnostics, such as those resembling Kant or Weatherhead, may allow that one believe even though knowledge is not possible. On the other hand, suspension of belief may be advocated, as suggested by Hume, or perhaps disbelief might be adopted. In short, there is no single, straightforward understanding of agnosticism.

AGNOSTICISM AND ATHEISM. Definitional Issues. The terms *ATHEISM* and *AGNOSTICISM* lend themselves to two different definitions. The first takes the privative *a* both before the Greek *theos* (divinity) and *gnosis* (to know) to mean that atheism is simply the absence of belief in the gods and agnosticism is simply lack of knowledge of some specified subject matter. The second definition takes atheism to mean the explicit denial of the existence of gods and agnosticism as the position of someone who, because the existence of the gods is unknowable, suspends judgment regarding them (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST).

Each definition has its advantages and disadvantages. The first is the more inclusive and recognizes only two alternatives: Either one believes in the gods or one does not. Consequently, there is no third alternative, as those who call themselves agnostics sometimes claim. Insofar as they lack belief they are really atheists. Moreover, since absence of belief is the cognitive position in which everyone is born, the burden of proof falls on those who advocate religious belief. The proponents of the second definition, by contrast, regard the first definition of atheism as too broad because it includes uninformed children along with aggressive and explicit atheists. Consequently, it is unlikely that the public will adopt it. They also see some advantages in preserving the term *agnostic* for those who wish to claim the suspension of judgment as a third alternative between belief and disbelief.

It is usually unproductive to argue about the definitions themselves rather than dealing with those complex issues that anyone using either of the definitions ultimately has to discuss: the various types of explicit atheism in Western culture as well as the rationale that those who call themselves agnostic give for their suspension of both belief and disbelief. In what follows, I will be dealing with the most important contemporary types of atheism, even though the phenomenon goes back to the ancient world. Since these types have been principally formulated over against the monotheism common to the three major religious traditions—Christianity, Islam, and Judaism—it is with these types that I will be concerned. Then I will turn my attention to the phenomenon of agnosticism, especially the issues that arise in Thomas Henry HUXLEY's formulation of it.

Types of Atheism. Although atheists agree in denying the existence of gods however conceived, they often give quite different reasons for this denial. These differences are, in turn, often grounded in the worldview or philosophical beliefs of the individual atheist. Some atheistic denials, for example, spring from an alternative metaphysical system, as was the case of Baron d'HOLBACH, who, in 1770, developed one of the first materialistic systems (see MATERIALISM, PHILOSOPHICAL; ENLIGHTENMENT, UNBELIEF DURING THE). A great deal of modern atheism, on the other hand, rests on the conviction that theism of any sort is incompatible with modern science, especially Darwinian evolution and contemporary cosmologies (see DARWINISM; ANTHROPIC PRINCIPLE). Still another form of atheism reflects Friedrich NIETZSCHE's view that all otherworldly beliefs, whether metaphysical or religious, are an expression of psychological weakness. Sometimes the rejection of theism is based on highly technical logical arguments typical of the discourse of professional philosophers, while at other times it is a part of a synthesis of a range of convictions and beliefs characteristic of modernity, as in the case of

secular humanism. Because of this variety of types of atheism, it would be more useful to forgo generalization about it in favor of depicting certain influential types.

Atheism as Counterinterpretation of Religion. Although atheism is found in the ancient world—one thinks of EPICURUS (341–270 BCE)—the characteristic forms of modern atheism are rooted in the eighteenth-century Enlightenment with its newfound confidence in reason and the sciences, its distrust of appeals to revelation, its demand for freedom of expression, and its correlative hostility to political and ecclesiastical authority. The first intellectual result of this Enlightenment ethos was DEISM, even among such radical critics of Christianity as VOLTAIRE. But it was not long before deism itself was subjected to devastating criticism by David HUME. As a consequence, the intellectual in the Western world was for the first time confronted with not only the possibility of skepticism but the explicit atheism propounded by such radical French thinkers as d'Holbach.

Although it is debatable whether Hume was himself an atheist, he constructed a type of argument concerning religion that has been extraordinarily influential in contemporary atheistic circles. He proposed a thesis shocking to the eighteenth-century world, namely, that one could write a natural history of religion. In doing this he did not so much propose philosophical objections to religious beliefs as provide what seemed to be a more plausible explanation for these beliefs than theists could themselves offer. The belief in supernatural gods, he argued, can best be explained by the propensity of human beings to personalize the unknown causes that impinge on them and cause them anxiety. The significance of this type of proposal is that it does not depend simply on a rejection of the arguments of theists but attempts to offer a counterinterpretation of the origins and the persistence of theism.

Hume's argument is put in very general terms but it is the forerunner of atheistic arguments elaborated in the nineteenth century. Perhaps the most powerful use of this type of counterinterpretation is to be found in the writings of Ludwig FEUERBACH, who argued that the self is immersed in and absolutely dependent upon the forces of nature. Out of its feeling of dependence and the anxiety that follows from it, the imagination takes over and personifies these forces. This yields polytheism in more primitive cultures, but monotheism results in more developed civilizations in which nature is seen as a unified whole. A god, Feuerbach argued, is essentially a being who is concerned for the individual's welfare and can protect her from suffering and death.

A similar although less developed theory was advanced by Nietzsche, who argued that the inveterate tendency of the human mind under the pressure of a language constructed around subjects and predicates is to see a "doer" behind every event and so to create a "true world" behind the apparent world. This phenomenon would not in itself be particularly deleterious did it not provide the occasion for sufferers and the psychologically weak to long for this better, truer world in order to avoid the evils of the apparent, real world. Priests then capitalize on this longing and constitute themselves the necessary gatekeepers to this truer world.

This counterinterpretation of religion does not stand alone but is buttressed by explicit philosophical and ethical criticisms of theism. Philosophically, for example, Feuerbach argued that the god of Christian theism has mutually incompatible predicates: the anthropomorphic, to which the naively religious cling, and the metaphysical, to which the theologians retreat in order to avoid the embarrassment of the anthropomorphism. Theism is also always threatened by scientific explanations. Ethically, both Feuerbach and Nietzsche argued that religious faith corrupts both the moral and the truth sense: The moral sense, because faith is set above moral and ethical considerations; the truth sense, because it rests on the conviction that the deity revealed itself only to a particular group. For both of them, religious faith is a kind of diseased *eros*, a desire on the part of the individual to avoid suffering and to live forever.

This type of atheism has found contemporary expression in the twentieth century in the writings of Sigmund FREUD and anthropologists such as Weston La Barre and Melford Spiro. Freud argued that primitive people and children live under the principle of the "omnipotence of thoughts" and attribute immense importance to wishes, as can be seen in magic and play. This, in turn, reflects a fundamental narcissism that is dealt with in defensive reactions designed to ward off disaster and death. The basic argument, then, is that the human self coming to self-consciousness tends to personify the forces that impinge upon it and then interprets these forces in parental terms, as a nurturing mother and, later, the father. Through the long period of human dependency the child becomes accustomed to calling on these figures in times of stress. It is natural, then, that when danger and stress arise and no parent is available, the person is driven to perceive the nonhuman environment in terms of this infantile prototype.

Atheism as Rooted in an Ethics of Belief. Another influential precursor to a type of contemporary atheism is to be found in the writings of the British mathematician and philosopher William Kingdon CLIFFORD. Clifford was less concerned to criticize the concept of God than he was to argue that any belief not based on evidence corrupts both the individual and society. It corrupts the individual because when we let ourselves believe for reasons not based on evidence we weaken our powers of self-control, of doubting, and of fairly seeking evidence (see EVIDENTIALISM). It corrupts the society because the progress of society depends upon individuals who exercise these faculties of judgment. Unreasoned belief makes a society credulous and lazy. Consequently, he concluded that everyone has the duty to guard the purity of his belief. Indeed, "it is wrong

always, everywhere, and for anyone, to believe anything on insufficient evidence." Insofar as religious beliefs are not founded on evidence, it is wrong to hold them, and Clifford was particularly critical of the Roman Catholic priesthood for promoting the doctrines of original sin, vicarious suffering, and eternal punishment.

Atheism as a General Worldview. Perhaps the most representative form of atheism in the Anglo-Saxon world is the atheism built upon more general and nontechnical assumptions about the relationships among critical intelligence, religious skepticism, science, and a healthy society. This type of atheism is characteristic of the movement called SECULAR HUMANISM. Although a representative document "A Secular Humanist Declaration" does not explicitly endorse atheism and even welcomes religious believers who share its values, it notes more aggressively that it finds the traditional view of God as either meaningless or undemonstrated and rejects religious experience as having anything to do with the supernatural. Men and women are said to be responsible for their own destinies and cannot look toward some transcendent being for salvation.

As in the case of Clifford, the driving impulse of the secular humanist movement is the conviction that a flourishing human civilization depends upon free intellectual inquiry and, consequently, it rejects any attempt, whether civil or ecclesiastical, to restrict this inquiry. Moreover, this inquiry necessarily assumes the discipline of rejecting appeals to faith and revelation in contrast to logic and science. Although it acknowledges the imperfections of the scientific method, it argues that it is the most reliable way of understanding the world.

Secular humanism is especially concerned to argue, as Pierre BAYLE did centuries ago, that atheism and agnosticism do not lead to immorality, as religious authorities have tended to argue. It argues that ethics can and has been intellectually separated from the claims of religion, as can be seen in a long philosophical tradition extending back from John DEWEY to ARISTOTLE. Just as critical reason is to be employed in the sphere of knowledge, so too should it be employed in ethics. Its aim is to cultivate an appreciation for social justice and the individual's obligations toward others.

Philosophical Atheism. The atheism of secular humanism, as I have noted, is formulated in nontechnical terms, but it includes among its proponents many professional philosophers who would justify their atheism on what they consider to be strictly philosophical and logical arguments. As a result, this form of atheism necessarily adopts the style and technique of academic philosophy. A well-known example of this type of atheism is J. L. MACKIE's *The Miracle of Theism: Arguments For and Against the Existence of God*. In this book, Mackie carefully considers and rejects all of the classical arguments for the existence of God—the ontological, cosmological, moral, and teleological (the argument from design)—and also takes up the argument from consciousness, the problem of evil, religious experience, and the claim that religious faith is a "leap." He even considers and rejects the modern view attributed to Ludwig WITTGENSTEIN and R. B. Braithwaite that Christianity is not to be understood as a series of beliefs at all, but rather as a way of life associated with certain stories. Since it is not a series of beliefs, it is said not to be subject to the rational attacks of philosophers.

Just because these arguments against theism are so technical and complex, it is not possible to discuss them here. But it is important for laypeople to understand that Mackie does not argue that the failure of theist arguments itself entails atheism; rather, he argues that when all the various arguments he has considered are taken together, "the balance of probabilities . . . comes out strongly against the existence of a god." And this probability is increased when we consider that one can, like Hume and Feuerbach, provide a natural explanation for the origin and persistence of religious belief.

A great deal of the contemporary professional discussion in philosophy between theists and atheists revolves around the problem of evil (see EVIL, PROBLEM OF). Most philosophers would agree that evil constitutes the most important objection to classical theism, although it would not be a devastating criticism if God were limited in some fashion, as John Stuart MILL has argued. The objection, which is an ancient one, is that either God can do something to prevent the manifest evil in the world but will not, or God wishes to prevent or mitigate evil but cannot. Christian theists, especially, are not lacking for some replies to this dilemma, most of them being some variant of the view that the manifest evil in the world is permitted by God as necessary for some higher good. And of these higher goods, theists point to the existence of creatures with free will (see DETERMINISM). If there is to be free will, they argue, then there must be the possibility that some will choose evil. Atheists, by contrast, find this solution unconvincing. First of all, it does not consider the chaos and suffering that has nothing to do with human choice. Second, if the deity has created people who can sometimes prefer the good, it could have created them so that they always choose the good. For Christians to argue that this is impossible is unconvincing because their own view of heaven refers to just such a situation in which the good is always chosen.

In contemporary debate, some Christian theists have interjected the notion of the hiddenness of God as one of the necessary conditions for the exercise of free choice. God, so to speak, has placed his creatures at an "epistemic distance," a distance that is logically necessarily for two reasons: (a) so that persons will not be, as it were, forced to believe in him, and (b) so that their moral choice to be obedient is not based on hope of reward. In short, God is hidden to preserve both our cognitive and our moral freedom to form our character for good or ill.

Atheists, of course, regard these arguments as uncon-

vincing. The notion that any knowledge of God would jeopardize our cognitive freedom has first to settle the issue whether belief is voluntary or not and whether moral choice is better when made in ignorance rather than with knowledge. At least one philosopher, J. L. Schellenberg, has turned the argument for the hiddenness of God against the theist and in support of atheism. His argument goes something like this: (1) If there is a god, he is perfectly loving; (2) if a perfectly loving god exists, reasonable nonbelief would not occur; (3) but reasonable nonbelief does occur; (4) so no perfectly loving god exists; therefore, (5) there is no god.

Atheism as Incompatible with Science. These philosophical arguments are exceedingly abstract and their persuasiveness and validity often depend on technical premises that are themselves debated by philosophers. It is not surprising, then, that there are atheists like Taner Edis, who, in his book *The Ghost in the Universe*, argues that these abstract, metaphysical arguments too often obfuscate rather than illuminate. The arguments are interminable and there are no possible and tangible verifications of them. He regards them as philosophical wheel spinning, claiming that we need a different kind of debate in which we take the claims of an existing religion whose metaphysical claims are normally connected to potentially embarrassing supernatural claims and examine them in the light of our best scientific knowledge. He then engages in a detailed discussion of the theory of creation versus the theory of evolution, the idea of God and modern physics, the religious claims about the Bible, Jesus Christ, and miracles, as well as mysticism and the nature of faith. His conclusions are atheistic, although he argues for a kind of poetry that has its roots in our historic religions but that does not tell us how things really are.

Atheism as Revolt. There is still another type of atheism worth noting that emerged after World War II and is sometimes associated with EXISTENTIALISM. This atheism is championed not because it is incompatible with science, but in the interest of the enhancement of the inner life. It argues that religious faith relieves the person from the burden of freedom, and that the rejection of absolutes of any kind is what gives life its value and, spread over a lifetime, restores majesty to that life. A powerful literary expression of this type of atheism is found in the writings of the French journalist Albert CAMUS. In his essay "The Myth of Sisyphus," he was concerned with the issue of why anyone should commit suicide, as some did, because they thought life had no higher meaning. He understood how such a question could arise because there are unavoidable experiences in life that prompt this question, especially when one has experienced a sense of the groundlessness and contingency of everything. The history of Western thought and religion may be understood as a series of attempts to discover some such ultimate meaning. But Camus concluded that any candid history of these attempts since PLATO reveals a series of impotencies. The human mind yearns for some final answer, but the world yields none. It is this incommensurability between the desire for meaning and the indifference of the universe that he labels "the Absurd." He argues, however, that instead of trying to escape the Absurd by suicide, religion, or philosophy, it is better to live with the conscious awareness of the lack of any transcendent meaning. It is better to live in revolt than in religious faith: whereas hope and faith relieve individuals of the weight of their lives, revolt casts them back on themselves and on the significance of every moment.

Agnosticism. The term *agnosticism* was coined by T. H. Huxley in the nineteenth century and soon was widely adopted by those who wanted to be neither theists nor aggressive atheists. Huxley later wrote that he coined the term because when he achieved intellectual maturity and noted that most of his colleagues were "-ists" of some kind—materialists, idealists, or atheists—he discovered that what separated him from them was that they all claimed to have *gnosis*, or knowledge, concerning the deepest issues of human existence, whereas he did not. And so he coined the privative *agnostic* to signify that he, for one, just did not know.

Actually, Huxley's position, when analyzed, involves more than simply the claim not to know. It is, as he makes clear, a commitment to a principle or method, a method that may be stated both positively and negatively. Positively, it means that we should follow our reason as far as it will take us in all matters of the intellect without regard to any other consideration. Negatively, it means that in matters of the intellect we should not pretend that conclusions that are neither demonstrated nor demonstrable are certain.

To say that the conclusions in the case of theism are not demonstrable reflects Huxley's obvious debt to the philosophy of Immanuel KANT, whose critique of classical metaphysics yielded the conclusion that the human mind by virtue of its very constitution was limited to knowledge of the world of sense experience. The mind was quite incapable of knowing anything that transcended that sense experience. But Kant did not deny the existence of God. Indeed, he argued that the idea of God was a "postulate" of the pure reason, and even though pure reason could not say that this postulate referred to an actual existing being, the moral or practical reason was compelled to posit God's existence. He wrote that he had limited reason in order to make room for faith.

Religious Agnosticism? The Kantian position that the divine is unknowable but nevertheless can be the legitimate object of belief is one of the reasons it is argued that agnosticism is not itself a third alternative to belief and unbelief. One might hold that the divine is unknowable and yet either believe or not believe. Indeed, there were prominent Protestant theologians in the nineteenth century—Friedrich Schleiermacher, Albrecht Ritschl, and Bishop Henry Mansel—who, under the influence of

Kant, argued that the divine was unknowable and that Christian theology was not a science of the divine but a description of the religious feelings or the value judgments of the community.

Huxley, however, would probably have refused to permit these theologians to claim the term *religious agnostic* for their position. He undoubtedly would have argued that these religious feelings and value judgments of the religious community were grounded in a certainty that a supernatural reality existed, and it was just such a certainty that his ethic of belief proscribed. Huxley's agnosticism was driven by the judgment that it was morally wrong to hold propositions for certain that were neither demonstrated nor demonstrable. For him, then, the notion of religious agnosticism was an oxymoron.

The most interesting philosophical question here is not how we are to define agnosticism, but how one formulates an ethics of belief that proscribes religious belief. Huxley seems to have formulated his ethics of belief in two slightly different ways. The first is "that it is wrong for a man to say that he is certain of the objective truth of any proposition unless he can produce evidence which logically justifies that certainty." In this formulation, the accent falls on the issue of certainty. It is because the religious believer holds his doctrines to be certain even though evidence is lacking that Huxley is critical. But there is a second, stronger formulation. In this instance, Huxley argues that the agnostic must repudiate as immoral the claim "that there are propositions which men ought to believe, without logically satisfactory evidence; and that reprobation ought to attach to the profession of disbelief in such inadequately supported propositions." In this formulation, it is not the claim to certainty that is condemned but the very act of believing propositions unsupported by evidence.

Agnosticism and the Ethics of Belief. W. K. Clifford's formulation of this ethics of belief leaves no room for such an ambiguity. Clifford simply states that "it is wrong, everywhere, and for anyone to believe anything on insufficient evidence." If the religious believer claims that he does not know but nevertheless believes "by faith," Clifford believes this is a "sin against mankind." This prohibition, in turn, is linked with the duty to inquire about anything that is proposed for our assent. If someone says that they do not have the time for such an inquiry, then Clifford replies that they should have no time to believe.

Many contemporary philosophers not unfriendly to either atheism or agnosticism argue that however high-minded Clifford's ethics of belief seems, it nevertheless rests on an erroneous view concerning our epistemic situation. They argue that we do not acquire our beliefs through inquiry or by the weighing of evidence for every proposition recommended to us. Rather, our culture teaches us to organize our experience in certain ways by giving us conceptions, rules of use, names, and the like. We acquire a loosely connected network of propositions in which the consequences and premises are mutually supporting, a picture of the world. And among the propositions we acquire, many are not empirical or grounded in evidence, although this has nothing to do with either stupidity or credulity. We do not acquire them through testing or investigation but simply by belonging to a community bound together by education and science. It is against this background that doubt arises, either because we find ourselves entertaining propositions whose consequences are contradictory or because they contradict our picture of the world. We begin by believing and we must have grounds for doubting.

If we were to assume some such situation as this, then someone might reformulate the basis for something like agnosticism in two slightly different ways. First, one might say that the rules of the community bound together by education and science are such that one simply cannot assess the truth or falsity of theistic belief. One just does not know and one decides to be neither a denier nor a believer. He or she is an agnostic. But there is a second formulation that preserves more of the intellectual ideal of Clifford. Here one decides to live as lucidly as possible, and this means actively willing to live within the limits of what seems evident to our community of education and science. The ideal is to keep one's mind as unclouded as possible by nostalgic desires and appeals to the absolute. One accepts the relativity of one's place in history and refuses to go beyond that complicated nest of propositions that our community has taught us constitutes reasonable belief. Perhaps many of these beliefs will be regarded by some future community as erroneous and theism may even come to seem more reasonable than it now is. But we will only arrive at this future reasonable community if we adopt those norms and procedures of inquiry that have produced what we now consider to be acceptable knowledge. Therefore, one does not now actively believe there is a deity but one does not claim that it does not exist. Under one definition, this is atheism; under another, it is called agnosticism.

VAN A. HARVEY

ALLEN, ETHAN (1739–1789), American soldier and author. A courageous and intrepid hero of the Revolutionary War, Allen survived three years as a prisoner of the British and wrote the first sustained defense of DEISM in the United States. He grew up in a New England farming family and experienced the uncertainties and hardships typical of that era. In the 1760s he became a close friend of a physician Thomas Young, with whom he explored ideas arising from the deist tradition of John TOLAND and others. Allen and Young decided to write a book on this subject, but apparently did not complete it at the time—though Allen would later use some manuscript material from this collaboration.

By 1770 Allen had become active in the formation of the Green Mountain Boys, a militia of farmers who opposed attempts of Governor William Tryon of New York to thwart their claims to lands in what is now the state of Vermont. During this time Allen developed a well-earned reputation for hardheaded tenacity and exuberant profanity. When the Revolutionary War erupted, Allen and a group of his men marched to Fort Ticonderoga, where they surprised the heavily outnumbered British garrison. Allen demanded their surrender "in the name of the great Jehovah and the Continental Congress." This victory was a considerable morale booster for the rebels. But when Allen led an invasion of Canada, he was captured at Montréal and underwent severe treatment as a prisoner of war. His captors often cursed him and his fellow prisoners, threatening them with being hanged as traitors. Taken to England, Allen was displayed in chains in Falmouth, but was later transferred back to America. In New York City he witnessed the starvation of hundreds of American soldiers at the hands of the British. Upon release, Allen went to Valley Forge, where Gen. George Washington acclaimed his valor. His *Narrative of Colonel Ethan Allen's Captivity* was published in Philadelphia in 1779, while the outcome of the war was yet to be decided. Written in a vivid, homespun style, the *Narrative* presents a dramatic picture of his seizure of Ticonderoga, and the hardships he and his comrades suffered as prisoners.

After the victory of the Revolution in 1781, Allen continued to agitate for the admission of Vermont to the Union (not attained until 1791, after his death), and against what he viewed as tyrannical tendencies in the new republic. However, he soon decided to retire from active political life, and to complete the book he and Young had projected decades before.

Reason, the Only Oracle of Man was published in 1784 at Allen's own expense, though the printer refused to release it for two years. From an edition of perhaps fifteen hundred, only two hundred were sold before a fire destroyed most of the rest. Hence, the book became both scarce and notorious, even in Allen's lifetime.

In his preface, Allen writes: "I have generally been denominated a Deist, the reality of which I never disputed, being conscious I am no Christian, except mere infant baptism make me one; and as to being a Deist, I know not, strictly speaking, whether I am one or not, for I have never read their writings." Today, scholars tend to concur that a great part of Allen's book was probably written by his friend Young, who must have read at least some previous deist literature.

In thirteen chapters, *Reason, the Only Oracle of Man* takes up a number of ideas that would become standard fare in subsequent deist and FREETHOUGHT writing even to the present day. In common with deists, Allen argues that God represents a First Cause of the universe, and that the existence of this kind of deity can logically be inferred from the consistency of the laws of nature. Thus, like SPINOZA and Newton, Allen holds that God is for all practical purposes nearly equivalent to Nature. "God, the great architect of nature," he writes, "has so constructed its machinery, that it never needs to be altered or rectified." Like David HUME, Allen further argues that miracles, being by definition exceptions to the laws of nature, are generally fantastic and unbelievable on their face. "Nothing is more evident," Allen concludes, "to the understanding part of mankind, than that in those parts of the world where learning and science has prevailed, miracles have ceased."

Allen denounces episodes of demonic possession such as were experienced during the Salem witch trials: "Great numbers of the inhabitants of both sexes were judicially convicted of being wizards and witches, executed accordingly; some of whom were so infatuated with the delusion, that at their execution they confessed themselves guilty of the sorcery for which they were indicted." With satisfaction, Allen notes that in British jurisprudence, the laws against witches enacted during the reign of James I were repealed in 1739. Even so, Allen observes that various fantastic claims were entertained by the Shakers in his own times, under the misguided leadership of their "Elect Lady," Ann Lee. Allen wastes little time on the devil, mocking the large numbers of those who superstitiously credit that he actually exists (see DEVIL, UNBELIEF IN THE).

In the line of common deistic argument soon taken up by Thomas PAINE in his *Age of Reason*, Allen contends

that the Mosaic account of creation is inconsistent and that the multiplicity of claims to ultimate truth by particular religions tends in the long run to cancel them all out. None is worthy of a vast, impersonal First Cause. Hence all forms of divine revelation are untenable, as are claims to Christ's divinity. Allen easily shows that the Bible itself is a historic document; its manuscripts were originally various, and translations equally so.

Moving toward his conclusion, Allen admits that "such of mankind, as break the fetters of their education, remove such other obstacles as are in their way, and have the confidence publicly to talk rational, exalt reason to its just supremacy, and vindicate truth and the ways of God's providence to men, are sure to be stamped with the epithet of irreligious, infidel, profane and the like." In response, he concludes, "all the satisfaction the honest man can have while the superstitious are squibbling hell fire at him, is to retort back upon them that they are priest ridden."

In spite of what he already perceived as social marginalization, Allen disdained to soften his views; like a soldier, he was prepared to take the consequences of telling the truth as he saw it. Having defied the king, he was not going to accept the king's tyrannical God, and he placed his hope for the republic in the steady advance of reason.

In retirement, Allen lived quietly until his death, at which time there was no religious ceremony, though the stone placed over his grave included a verse thus: "His spirit tried the mercies of his God, / In whom he believed, and strongly trusted." In 1855 a monument to his memory was erected in Burlington, Vermont.

FRED WHITEHEAD

ALLEN, STEVE (1921–2000), American entertainer and author. Steve Allen was a unique figure in popular American culture, particularly in the media, for he was an outstanding defender of humanism and skepticism. His talents were multidimensional. He has been heralded by the entertainment industry as a gifted raconteur, comedian, performer, television pioneer, author of songs, plays, short stories, and novels, among other achievements.

He also had a serious side. A man deeply interested in ideas, he stands out as one of the few skeptical and agnostic intellectuals able to survive in the mass media (see SKEPTICISM; AGNOSTICISM). Allen was a defender of often-unpopular causes—he was a consistent liberal in politics, a humanist and skeptical critic of religion and the paranormal, an exponent of rationality, and a severe opponent of raunch in TV and radio. This latter position provoked criticism from his liberal friends because he seemed to have allied himself with conservatives.

His award-winning TV series *Meeting of Minds*, which he wrote and produced in cooperation with his wife, Jayne Meadows, stood out in comparison with the generally mundane wasteland of TV fare. This series pitted SOCRATES, Marie Antoinette, Sir Thomas More, Tom PAINE, Karl MARX, Attila the Hun, Emily Dickinson, Thomas Aquinas, GALILEO, Charles DARWIN, and other historical figures in dialogue and disputation. Allen published fifteen books with Prometheus Books, including four volumes of the scripts from *Meeting of Minds* and several titles critical of American popular culture, such as *Dumbth: The Lost Art of Thinking with 101 Ways to Reason Better & Improve Your Mind* (1998), which dealt with the dumbing down of American life; and *Vulgarians at the Gate: Trash TV and Raunch Radio: Raising Standards of Popular Culture* (2001), which criticized vulgarity in the media.

Two of his books stand out for their contributions to biblical criticism and freethought: *Steve Allen on the Bible, Religion, & Morality* (1990) and *More Steve Allen on the Bible, Religion, & Morality* (1993). These books were issued at a time when the fundamentalist political movement in America was growing through organizations like the Moral Majority and challenging American secular values.

In his preface to the first volume, Allen said that although it had been his original intention to publish his studies after death, he decided to permit the publication earlier "because an element of emergency has entered the public dialogue." Steve Allen's books on the Bible, religion, and morality were unique, for they were virtually the only critical commentaries on the Bible published by a leading media celebrity containing not simply praise for Jesus but recognition of scripture's many factual errors, inconsistencies, and moral limitations. For example, Allen states: "The proposition that the entire human race—consisting of enormous hordes of humanity—would be placed seriously in danger of a fiery eternity characterized by unspeakable torments purely because a man disobeyed a deity by eating a piece of fruit offered him by his wife is inherently incredible."

Martin Gardner, in the preface to the book, said, "No other work by an American can be likened more favorably to Tom Paine's classic, *The Age of Reason*, than Steve Allen's book"—a compliment of the highest order coming from one of America's leading critical essayists. Indeed, Allen's two volumes could also be likened to the writings of Robert Green INGERSOLL, America's leading orator and agnostic of the nineteenth century. Allen was not an atheist (see ATHEISM), but he was a freethinker in

the best sense of the word (see FREETHOUGHT), for he attacked fanatic and dogmatic religion at a time when he felt that this kind of criticism was necessary. He admitted that he was an agnostic.

Steve Allen also participated in many conferences of the Committee for the Scientific Investigation of Claims of the Paranormal (CSICOP), the Council for Secular Humanism, and the Center for Inquiry. He joined CSICOP's Council for Media Integrity in order to persuade television producers and writers to include more scientific content in their programs and to avoid confusing pseudoscience with genuine science. He thought that the campaign for scientific literacy was crucial to the future of the United States, for its scientific and technological development depended in part upon the public understanding of science.

He was elected a Laureate of the International Academy of Humanism in recognition of his commitment to science, reason, the cultivation of free inquiry, and humanist values.

PAUL KURTZ

AL-MA'ARRI (also known as ABU'L-'ALA AHMAD bin ABDALLAH; 973–1058), Islamic thinker. Al-Ma'arri, sometimes called the Eastern LUCRETIUS, is one of the great freethinkers of Islam. Born in Syria not far from Aleppo, Al-Ma'arri (or Abu'l-'Ala, as he is sometimes called) was struck at an early age with smallpox, which was eventually to lead to his total blindness. He studied in Aleppo, Antioch, and other Syrian towns before returning to his native town of Maara. As a young poet Al-Ma'arri was attracted to the famous cultural center of Baghdad, to which he traveled in 1008, but stayed only eighteen months.

Returning home, he lived in semiretirement for the next fifty years until his death. Such was his fame, however, that eager disciples flocked to Maara to listen to his lectures on poetry and grammar. His poetry is deeply affected by a pervasive pessimism. He constantly speaks of death as something very desirable, and regards procreation as a sin. At times, at least, he denies the resurrection. As for religion, he argues that all people unquestioningly accept the creed of their forebears out of habit, incapable of distinguishing the true from the false.

For Al-Ma'arri, religion is a "fable invented by the ancients," worthless except for those who exploit the credulous masses. At other times he refers to religions as "noxious weeds":

> Among the crumbling ruins of the creeds
> The Scout upon his camel played his reeds
> And called out to his people—"Let us hence!
> The pasture here is full of noxious weeds."

He clearly puts Islam on the same level as all other creeds, and believes not a word of any of them:

> What is religion? A maid kept close that no eye may view her;
> The price of her wedding-gifts and dowry baffles the wooer.
> Of all the goodly doctrine that I from the pulpit heard
> My heart has never accepted so much as a single word.

"Do not suppose the statements of the Prophets to be true; they are all fabrications. Men lived comfortably till they came and spoiled life. The 'sacred books' are only such a set of idle tales as any age could have and indeed did actually produce. What inconsistency that God should forbid the taking of life, and Himself send two angels to take each man's! And as for the promise of a second life—the soul could well have dispensed with both existences."

On Al-Ma'arri's view, Islam possesses no monopoly on truth; as for the *ulama*, the Muslim "clergy" or divines, Al-Ma'arri has nothing but contempt for them. Al-Ma'arri is a supreme rationalist (see RATIONALISM) who everywhere asserts "the rights of reason against the claims of custom, tradition and authority," mercilessly attacking every kind of superstition—astrology, augury, belief in omens, the custom of exclaiming "God be praised" when someone sneezes, and the like. He ridicules beliefs that the patriarchs lived to be hundreds of years old or that holy men walked on water or performed miracles.

Al-Ma'arri further offended Muslim sensibilities by composing "a somewhat frivolous parody of the sacred volume" (the Qur'an) and declaring that "in the author's judgment its inferiority was simply due to the fact that it was not yet polished by the tongues of four centuries of readers."

Another remarkable feature of Al-Ma'arri's thought was his belief that no living creature should be injured or harmed in any way. He adopted vegetarianism in his thirtieth year and held all killing of animals, whether for food or sport, in abhorrence. In his poetry, Al-Ma'arri firmly advocates abstinence from meat, fish, milk, eggs, and honey on the ground that it is an injustice to the animals concerned. Animals are capable of feeling pain, and it is immoral to inflict unnecessary harm on our fellow creatures. And even more remarkably, Al-Ma'arri protests against the use of animal skins for clothing, suggests wooden shoes, and reproaches court ladies for wearing furs. Von Kremer has justly said that Al-Ma'arri was centuries ahead of his time.

Al-Ma'arri was charged with HERESY during his life, but was neither prosecuted nor punished, for reasons that Von Kremer and Nicholson have carefully analyzed. Al-Ma'arri himself tells us that it is often wise to dissimulate, and thus we find in his poetry many orthodox passages meant to throw the sniffers of heresy off the scent. At heart, he seems to have been a thorough skeptic who managed to ridicule practically every dogma of Islam.

IBN WARRAQ

AL-RAZI, ABU BAKR MUHAMMAD BIN ZAKARIYA (865–925), Islamic thinker. Perhaps the greatest freethinker (see FREETHOUGHT) in the whole of Islam was al-Razi, known as Rhazes in medieval Europe and as Razis by Chaucer. Al-Razi was a native of Rayy, near Tehran, where he studied mathematics, philosophy, astronomy, literature, and perhaps alchemy. He learned his medicine in Baghdad.

Al-Razi is credited with at least two hundred works on a wide variety of subjects excluding only mathematics. As a physician, al-Razi was a thorough and undogmatic empiricist. This is evident from his extant clinical notebook, in which he carefully recorded the progress of his patients, their maladies, and the results of their treatment. He wrote what was perhaps the earliest treatise on infectious diseases—smallpox and measles—based on his own painstaking empirical observations.

Most unusually, in *The Spiritual Physick*, his treatise on ethics, al-Razi refers not once to the Qur'an, the sayings of the Prophet, or any specific Muslim doctrine. The scholar Arberry describes his attitude as "tolerant agnosticism" and "intellectual hedonism." In the *Physick* al-Razi advocates moderation, disapproves of asceticism, and enjoins control of one's passions by reason. On life after death he reserves judgment, seeking to use reason to allay the fear of death, in a manner reminiscent of EPICURUS.

Al-Razi sees no possibility of a reconciliation between philosophy and religion. In two heretical works (see HERESY), one of which may well have influenced the European freethought classic *De Tribus Impostoribus* (see ITALY, UNBELIEF IN), al-Razi gives vent to his hostility toward the three revealed religions of the West. Al-Razi's heretical book *On Prophecy* has not survived, but we know that it maintained the theses that reason is superior to revelation and that salvation is possible only through philosophy.

In another work, al-Razi maintains that all men are by nature equal and equally endowed with the faculty of reason, which must not be disparaged in favor of blind faith; reason further enables men to perceive scientific truths in an immediate way. The prophets—"these billy goats with long beards"—cannot claim any intellectual or spiritual superiority; they pretend to come with a message from God, exhausting themselves in spouting their lies and imposing on the masses blind obedience to the "words of the master." Either the miracles of the prophets are impostures based on trickery, or the stories regarding them are lies. The falseness of what all the prophets say is evident in the fact that they contradict one another—one affirms what the other denies, and yet each claims to be the sole depository of the truth. Thus the New Testament contradicts the Torah, and the Qur'an the New Testament. As for the Qur'an, it is but an assorted mixture of "absurd and inconsistent fables" that has ridiculously been judged inimitable when in fact its language, style, and much-vaunted "eloquence" are far from faultless. Custom, tradition, and intellectual laziness lead men to blindly follow their religious leaders. Religions have been the sole cause of the bloody wars that have ravaged humankind. Religions have also been resolutely hostile to philosophical speculation and to scientific research. The so-called holy scriptures are worthless, and have done more harm than good, whereas "the writings of the ancients like PLATO, ARISTOTLE, Euclid, and Hippocrates have rendered much greater service to humanity."

In his political philosophy, al-Razi believed one could live in an orderly society without being terrorized by religious law or coerced by the prophets; that only through philosophy and human reason could human life be improved. Finally, al-Razi believed in scientific and philosophical progress, holding that the sciences progressed from generation to generation. He believed that one day they would be superseded by even greater minds than his.

IBN WARRAQ

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF ATHEISM. This quixotic American FREETHOUGHT organization, usually known as "the 4As," was founded in 1925 by freethinking lawyer Charles L. SMTIH and Freeman Hopwood, the grandson of a prominent frontier evangelist. New York briefly denied the group permission to incorporate on grounds that its purpose was (in its own words) "purely destructive . . . a wrecking company" whose "object . . . is to abolish belief in god, together with all forms of religion based upon that belief." Its goals included taxing churches, ending paid chaplaincy in government and the armed forces, ending state recognition of religious festivals, ending religious

oaths in courts and upon assumption of public office, and ending legal recognition of the Sabbath. Incorporation was secured by 1926.

Lacking resources and popular support, the 4As set out to achieve what it could by bluster. Smith gained wide publicity by announcing a scheme to spread ATHEISM among young Americans. Within eighteen months some twenty college atheist groups formed, taking colorful names like the University of North Dakota's Legion of the Damned. A Junior Atheist League organized groups in high schools; in Los Angeles an atheist Sunday school was held.

By 1927 the Ku Klux Klan was worried enough to proclaim a list of states in which it would not allow 4As representatives to speak. At its peak, the 4As had about three thousand off-campus members nationwide. Local groups operated in New York City; San Francisco; Fort Worth, Texas; Rochester, New York City; and Los Angeles, where the prodigiously capable child atheist activist Queen SILVER had been recruited to the Junior Atheist League. In a weird bit of cultural fallout, Cecil B. DeMille's last silent film, *The Godless Girl* (1929), concerned a Junior Atheist League–style high school atheist club whose charismatic female leader was modeled after Silver.

The 4As held annual conferences and held weekly lectures in New York. It sued to abolish paid congressional chaplains and the motto "In God We Trust," but failed to fund appeals after losing in lower courts. Ultimately its student atheism project sputtered, groups failing to survive their founders' graduations. The Depression devastated 4As finances. After 1933 it was little more than the publisher of the *4A Bulletin*, a newsletter edited by Woolsey TELLER.

Smith merged the 4As with the TRUTH SEEKER organization. The *4A Bulletin* continued separate publication, changing its name to the *Atheist* in 1947. Following Teller's death in 1954 the *Atheist* was edited by successive editors of *The Truth Seeker*, first Smith, then James Hervey JOHNSON, who had purchased *The Truth Seeker* and the 4As from Smith in 1964. With Johnson's death in 1988, the 4As essentially dissolved, though it and a sister group, the National League for the Separation of Church and State, maintained a vestigial online presence into the early twenty-first century.

AMERICAN FREETHINKERS LEAGUE. See HALDEMAN-JULIUS, EMANUEL.

AMERICAN HUMANIST ASSOCIATION. Early organized HUMANISM in the United States was at first closely associated with the Unitarian Church (see UNITARIAN UNIVERSALISM), but it had other sources as well. Auguste COMTE described three ages of religion in human history. The first, he said, was the *theological*, in which humans ascribed to the supernatural whatever they did not understand. This was followed by the *metaphysical*, in which ideas were thought to be the key to natural phenomena. Finally came the *positive*, in which phenomena were—and are—understood using the scientific method. Positivist clubs were formed in Europe and in the Americas. A Church of POSITIVISM was even established in Brazil in 1881.

Other groups had ideas resembling Comte's; a group calling itself the Humanistic Religious Association formed in London in 1853. Its members proclaimed themselves free from the ancient compulsory dogmas, myths, and ceremonies of the past. They met regularly for cultural and social meetings, provided education for their children, and assisted members in need. Charles BRADLAUGH, an avowed atheist, brought together freethinkers (see FREETHOUGHT) to form the NATIONAL SECULAR SOCIETY in 1866. In 1859 a new liberal Christian denomination, the *Bund Friereligose Gemeinden Deutschlands* (Federation of Free Religious Congregations of Germany) was established. In the United States, dissenters from creedalism within the Unitarian Church, led by Ralph Waldo EMERSON, founded the Free Religious Association, which included individuals of Jewish as well as Unitarian background. It promoted the idea of humanistic theism, but ceased to exist shortly after the beginning of the twentieth century. One of its supporters, Rabbi Isaac M. Wise, was a major force in organizing Reform Judaism, while another, Felix ADLER, founded ETHICAL CULTURE in 1876. Ethical Culture made social service a central focus, emphasizing the need to concentrate on this world and life. Adler's ideas were picked up by others who founded congregations in Chicago, Philadelphia, and St. Louis, among other places.

Moncure CONWAY, the American minister of a Unitarian chapel in London, began guiding his congregation in a specifically ethical direction. In 1887 his church became the SOUTH PLACE ETHICAL SOCIETY. In 1896 the International Ethical Union was established with congregations in the United States, the UK, Germany, Switzerland, Austria, and New Zealand.

The first reference to the concept of humanism in any of these groups came in the writing of Frederick J. Gould, a British Ethical Culture leader and editor of the *Leicester Reasoner*, who used the term *humanist* in an article in that paper to denote a belief and trust in human effort. After reading the article, John H. Dietrich, a Unitarian minister in Minneapolis, Minnesota, felt humanism was the best name for his new, fully naturalistic religious outlook. His conception of this term was adopted by other freethinkers—including Edward Howard Griggs, author of *The New Humanism: Studies in Personal and Social Development* (1899), and Frank Carleton Doan, who defended humanism and modernism in his *Religion and the Modern Mind* (1909)—as a way to explain their viewpoint.

These developments at the turn of the twentieth century marked a time when the Unitarian clergy was badly split between those who wanted a creed that would exclude both nontheists and other Christian dissenters from the denomination, and those who were opposed to creeds. It was not until a 1917 meeting of the Western Unitarian Conference, during which Dietrich and Curtis Reese combined their efforts to get the humanist movement under way within the Unitarian Church, that humanism began to gel as an organized movement. Progress was slow, however, until 1927, when a number of Unitarian professors and seminarians at the University of Chicago and Meadville Seminary (a Unitarian seminary that had recently moved from Pennsylvania to Chicago) organized to form a humanist fellowship. In 1928 the group launched a magazine titled the *New Humanist* (not to be confused with the present-day British publication of that name) to carry the message of a growing humanist movement. Edmund Wilson and Harold Buckman served as owners and publishers. The movement finally had a regular voice, which served briefly to unify "schismatic" ministers within the Unitarian Church.

Humanist ministers began again to leave the Unitarian Church, as Charles Francis Potter did in 1929 to form the First Humanist Society of New York. Still, the struggling humanist movement lacked focus until 1933, when thirty-four intellectual and ministerial leaders formulated and signed a document titled "A Humanist Manifesto," published in the *New Humanist*. Raymond Bragg and Ed Wilson took the lead in this initiative. Signers included the philosopher John DEWEY and the historian Harry Elmer Barnes, but most were leaders of Unitarian and Universalist societies. Still, the movement was a tenuous one. The *New Humanist* ceased publication due to lack of funds in 1936; in an effort to hold the movement together, Wilson began publishing a newsletter, the *Humanist Bulletin*, using his own funds.

Out of this ferment would emerge the American Humanist Association. Its immediate precursor, the Humanist Press Association, was organized in 1935. Modeled on the RATIONALIST PRESS ASSOCIATION (RPA) of the UK, it was designed to encourage publication of information about humanism. It took over publishing the *Humanist Bulletin* in 1938, though Wilson remained as editor. Its president, Curtis W. Reese, suggested changing the association's name to the broader American Humanist Association, and the organization was so incorporated in 1941. To signify this change, the *Humanist Bulletin* published its last issue in January 1942, and changed its name to the *Humanist*. The first issue of the new magazine appeared in the spring of 1942. Wilson was the dominant force in the organization, serving both as publisher of the journal and as administrator of the AHA while also serving as a Unitarian minister, first in Schenectady, New York, and later in Salt Lake City before establishing a headquarters at Yellow Springs, Ohio. Wilson edited the *Humanist* until 1956 and served a second temporary term as editor from 1963 to 1964. He served as executive director of the AHA until he was succeeded by Toby McCarroll in 1965.

The editorship of the *Humanist* and the executive directorship of AHA were generally kept separate after Wilson stepped down. Philosopher Paul Kurtz served as editor of the *Humanist* from 1967 to 1978, when Lloyd Morain assumed the position. He was succeeded by Fred Edwords. The positions of editor and executive director were combined again under Edwords in 1994 before being separated once more at the beginning of the twenty-first century.

Overseeing the affairs of the AHA is a board of directors chosen by ballot vote from its members. The board at times has been rather cantankerous and has fueled considerable change in the organization's direction. As humanism changed, so did the AHA. One sign of this was the new manifesto, *Humanist Manifesto II*, drafted by Paul Kurtz with the assistance of Roy Fairfield, Ed Wilson, and others. Issued in 1973, *Manifesto II* was signed by several hundred individuals. Other humanist organizations also began to appear, many of them local groups not affiliated with the AHA, although some of their individual members were also members of the AHA. Some of these groups later went national and international, but the most successful was a national organization from its inception. Now known as the Council for Secular Humanism, it was founded by Paul Kurtz and others in 1980 as the Council for Democratic and Secular Humanism. It publishes *Free Inquiry* magazine. Interorganizational rivalries peaked in the late 1990s over a document drafted by Kurtz which was to be called *Humanist Manifesto III*. The AHA claimed copyright in *Humanist Manifestos I* and *II* and thus claimed that only the AHA could issue a manifesto titled *Manifesto III*. Though this claim was questionable, the council chose to issue its completed statement in 1999 under the title *Humanist Manifesto 2000*. This document set forth a new vision of a planetary humanism, but in the process the split between the AHA and the Council for Secular Humanism sharpened. The AHA finally published its

own *Humanist Manifesto III* in 2004, but it was quite different from the earlier ones. Rather than listing specific goals, it made general statements without going into detail.

Now headquartered in the Washington, DC, area, the AHA has chapters in most major population centers of the United States. It was very active in the formation of the INTERNATIONAL HUMANIST AND ETHICAL UNION (IHEU) in 1952. Many of the individuals involved in this were also involved in the founding of the United Nations, and many of the humanist principles promoted by the AHA and the IHEU found expression in the international rights conventions of the UN. While the AHA is no longer the largest organization of humanists in the United States, it continues to grow slowly. Though there is not much programmatic difference between the AHA and the Council for Secular Humanism, the board of directors of the AHA is democratically elected, while the council has a self-perpetuating board, filling vacancies by board vote. The AHA is much closer to the Unitarian Universalist Church than is the council, and is a religious organization for tax purposes while the council holds educational status. Many humanists belong to both groups.

AMERICAN LITERATURE, UNBELIEF IN. Religious SKEPTICISM, ANTICLERICALISM, and radical thought have shaped American literature through the centuries. Often the voices of dissent come from those who have had the least power: women, slaves and free blacks, and Native Americans. These voices and the voices of others who refuse to accept the status quo have given American literature its distinctive flavor, changing in focus from era to era but always standing for religious freedom and human rights.

Dissent has been a part of American literature from the beginning. Puritan tracts of the seventeenth century may be considered the start of American literature, but even in that theocratic society, some people refused to believe what they were told. Anne Hutchinson could be considered the first anticlerical figure in American literature (see ANTICLERICALISM), because she insisted on following her own spiritual path despite being thrown in prison and finally banished. Hutchinson herself did not write much, but she recurs as a figure in American literature, representing the woman in opposition. In John Winthrop's *Journal*, she represents what happens when anyone questions the official religion—her child is stillborn, a "monstrous birth," and she later dies violently. Two centuries later, Nathaniel Hawthorne used Anne Hutchinson in *The Scarlet Letter* as the emblem of dissent against a repressive society.

Even as the Puritans were establishing their voice, Native Americans created oral tales and songs, and, later, slaves began to write their narratives. Contemporary literature by African American writers and by Native Americans has its roots in Puritan times or before and is by its nature a dissenting voice. American literature has always had a radical element, changing focus and forms over the centuries but ever vigilant against the hypocrisies and tyrannies of religion and the society that upholds it.

The Eighteenth Century, the American Enlightenment. The eighteenth century was the most radical in American history, leading to a revolution against monarchy and established religion. The great writers of the time, Benjamin FRANKLIN, Thomas JEFFERSON, and Thomas PAINE, were political figures, writing public papers in which they argued their radical thought. All three were outright in their anticlericalism, their religious SKEPTICISM, and their revolutionary ideas about politics and society. And all three were self-professed deists (see DEISM).

Benjamin Franklin wrote a humorous description in his *Autobiography* (1790) of turning to deism as a teenager by reading the arguments against it. However, as an adult, he gave his "mite" to many local churches, not because he had changed his mind, but because he believed that deism as a general principle wasn't "useful" for most people, whom he thought needed the coercive force of religion to keep them honest. He was willing to accept any religion as long as it fostered "Truth, Sincerity, and Integrity." His religious views were so rigorously tolerant that he convinced Philadelphians to build a meeting house for any speaker to use, "so that even if the Mufti of Constantinople" wanted to send a preacher, he would have a pulpit. This was a major shift away from the single-minded theocracy of the century before.

Franklin devised his own moral system, the "Thirteen Virtues," based on a spiritual pragmatism that considers frugality as important as humility. Nowhere in his "bold and arduous Project of arriving at moral Perfection" does Franklin include religious observance. Rather, his ethical project is rational and humanist (see HUMANISM).

Thomas Jefferson went further than Franklin in his attack on religious tyranny by writing religious freedom into law. In 1776 he helped change the laws of Virginia to protect every person's "natural right" to freedom of religion (see CHURCH, STATE, AND RELIGIOUS FREEDOM). Before that, the state practiced what Jefferson called "religious slavery," under which anyone who fell away from Christian beliefs would lose the right to hold office, be unable to sue, lose custody of children, and, in the most extreme case, be imprisoned for three years. Jefferson wrote an impassioned defense of religious freedom in his *Notes on the State of Virginia* (1784),

Query XVII. In his personal letters, Jefferson is vigorously anticlerical, particularly rejecting "priestcraft" in his letters to John Adams. In a letter to Adams dated April 11, 1823, he expresses his anger toward the Puritan religion that still lingered in American culture. He calls Calvin an "atheist" and Calvinism "daemonism." Jefferson's deism appears in this letter, in which he argues for "an ultimate cause." In a letter to William Short in 1819, Jefferson says that he follows the ideas of Epictetus and EPICURUS for self-government and considers Christ a "benevolent moralist." Christianity, on the other hand, is full of "bigotry and fanaticism" that has "deeply afflicted mankind." The "artificial systems" of religion are an evil that must be constantly guarded against in the new democracy.

Thomas Paine, likewise a strong proponent of deism, wrote *The Age of Reason* (1794) as a condemnation of the hypocrisies and cruelties perpetrated by believers in the Bible. Like Jefferson, Paine saw Christ as a man to be admired, calling him a "virtuous reformer and revolutionist," "an amiable man" whose vision has been distorted by "Christian mythology." He wrote with wry humor and elegant rationality as he shows the errors of religious superstition, and his rhetoric soars when he describes the deist vision. In contrast is the Bible, filled with "obscene stories," "voluptuous debaucheries," and "unrelenting vindictiveness." In France, Paine was imprisoned for defending deism as a natural religion; in America he was buried in dishonor, with Jefferson the only friend at the graveside, because he was popularly considered to be, as Theodore Roosevelt would later incorrectly call him, a "filthy little atheist." Still, *The Age of Reason* became the central text for philosophers who believed that "priestcraft" and tyranny went hand in hand.

In *The Rights of Man* (1791–92), Paine defends the right of every new generation to choose its own government. He shows that "by distortedly exalting some men, . . . others are distortedly debased" and, thus, that an aristocracy of wealth cannot succeed. Paine argues that the rights of man are fundamental and that unless a government is based on those rights it must fail.

In America in the eighteenth century, the three main human rights questions concerned slavery, the treatment of the American Indian, and the status of women. Although Franklin, Jefferson, and Paine agreed on the tenets of deism and democracy, they were not in accord on other human rights issues. Paine wrote an essay condemning slavery in America, and Jefferson argued against the slave trade in the Declaration of Independence. Franklin, late in life, came to hate slavery, also. But both Jefferson and Franklin owned slaves, and Jefferson wrote in Query XIV of *Notes on the State of Virginia* a "scientific" analysis of the inferiority of blacks to whites, including on grounds of appearance and intellect, arguing that the black race does not excel in any art and infamously declaiming that "religion could produce a Phyllis Whately [*sic*], but it could not produce a poet."

Phyllis Wheatley, the first African American poet, consistently made a stand for freedom. She had to write indirectly about slavery to be published, but she was clear in her hatred of "the iron chain," "wanton Tyranny," and the "lawless hand." In her epistle to the Earl of Dartmouth (1773), Wheatley says, "Should you . . . / Wonder from whence my love of Freedom sprung," just remember that she was "snatch'd" from Africa and her father's arms. Although a Christian, Wheatley raises a radical issue in "On Being Brought from Africa to America" (1773): "Remember, Christians, Negroes, black as Cain, / May be refined, and join the angelic train." To claim that blacks are equal to whites in heaven was daring in slave-bound America.

Another strong antislavery voice is Olaudah Equiano in *The Interesting Narrative of the Life of Olaudah Equiano* (1789), the first significant slave narrative. Like Wheatley, Equiano takes a Christian stance, but he calls Christianity and the profit motive into question when he describes the horrors of the slave ship he was forced onto as a child. In chapter 2, he describes in chilling detail the "stench" of the hold, the way people were "so crowded that each had scarcely room to turn himself," the "galling of the chains," and children falling into "the filth of the necessary tubs." In a radical reversal of the captivity narrative, Equiano describes his European captors as "bad spirits" with "horrible looks, red faces, and long hair." A child at the time, Equiano was afraid they would eat him. At the end of this chapter, Equiano writes in lofty disdain, "O, ye nominal Christians! might not an African ask you—Learned you this from your God? . . . Surely, this is a new refinement in cruelty."

On the other question of race, how to interact with the Native American, Jefferson and Franklin were ahead of their times. Franklin wrote a satirical piece in support of the Native American, "Remarks concerning the Savages of North America," in which he showed the Native Americans as more civilized than the whites. In the piece, a chief of the Six Nations politely explains that the Native Americans do not want their sons to go to the white colleges because when their young men come back to them "they [are] bad Runners, . . . unable to bear either cold or hunger . . . [are] therefore neither fit for Hunters, Warriors, or Counsellors; they [are] totally good for nothing." He suggests instead that the whites should have their sons educated by the Native Americans, who would "make *Men* of them." At the end of the essay, the speaker tells a story about a white man who offers him four shillings for a pound of beaver before going to church, but only three shillings and some pence afterward. "This made it clear to me," he says, "that whatever they pretended of Meeting to learn *good things*, the real Purpose was to consult, how to cheat Indians in the Price of Beaver."

Jefferson likewise extols the virtues of Native Americans in his *Notes on the State of Virginia*, Query VI,

finding them brave, intelligent, and advanced in the art of oratory, and in no way inferior to whites were they given the same education. Meanwhile, the Native Americans themselves gave stirring speeches in defense of their rights, an oral literature only recently recognized for its literary value.

The third human rights issue of the times was the rights of women. Franklin often took a woman's persona in his humorous essays, such as in "The Speech of Miss Polly Baker" (1747). Polly argues that she should not be punished for conceiving children out of wedlock, but should be paid by the state for populating the colony with the bastard children of its leaders. Although Polly is a strong female character, this is not a consciously feminist tract. Franklin did not believe in women's rights or in advanced education for girls. Jefferson is more outright in his misogyny, specifying in his letters to his daughter the limited education he considered appropriate for her. Jefferson believed that women should learn how to keep household accounts, speak French, and play the piano. He reserved any advanced education strictly for boys, although he was ahead of his time in including the top 10 percent of lower-class boys in this vision.

Thomas Paine, reliably on the liberal side of any argument, made a bow in the direction of equal rights for women, and his *Rights of Man* inspired the *Vindication of the Rights of Women* (1799) by English feminist Mary WOLLSTONECRAFT. Some eighteenth-century American women argued for women's rights, notably Judith Sargent Murray in "On the Equality of the Sexes" (1790). Tabitha Gilman Tenny's satiric novel *Female Quixotism* (1801) is remarkable: In an age when the only novels written in America were imitations of the English sentimental novel, *Female Quixotism* turns the sentimental novel upside-down. The novel's heroine, Dorcasina, tries her best to have a romantic encounter, but fails. The ostensible theme of the novel is that reading novels is pernicious for women, but the serious subtext argues for a wider education for women and more freedom to control their own lives.

Two other significant writers from this time period are J. Hector St. John De Crèvecoeur and Phillip Freneau. In his *Letters from an American Farmer* (1782), De Crèvecoeur describes the best in the American character (Letter III, "What Is an American"), including fairness to everyone and "decent" living. His vision for the future is that "religious indifference is imperceptibly disseminated from one end of the continent to the other." Gone will be "persecution, religious pride," and "the love of contradiction." But De Crèvecoeur also sees the negatives in America. In Letter IX, "Description of Charles-Town; Thoughts on Slavery," De Crèvecoeur describes a slave in a cage hanging from a tree, the birds pecking out his eyes. The man is in such pain that the narrator wishes to shoot him, but cannot. The narrator leaves the slave hanging there and goes to the home of the owner, who considers himself religious, only to hear the usual justifications for this barbarity. De Crèvecouer, seeing the vast wealth of Charlestown built on the backs of slaves, says, "[T]heir hearts are hardened; they neither see, hear, nor feel for the woes of their poor slaves. . . . The chosen race eat, drink, and live happy, while the unfortunate one grubs up the ground."

At the end of the century, Phillip Freneau wrote poems in support of human rights, such as "On Mr. Paine's *Rights of Man*" (1795), and in support of a "natural religion." In "On the Religion of Nature" (1815), Freneau praises a rationalist religion, believing that people are innately inclined toward "[t]he path of right." Because organized religion "dooms [mankind] to perpetual grief" and is built on "fraud, design, and error," we will find joy only by returning to our natural goodness.

The Nineteenth Century: Transcendentalism, Romanticism, and Realism. At the beginning of the nineteenth century, James Fenimore Cooper and Catherine Sedgwick picked up on the image of the strong, intelligent Native American drawn by Franklin and Jefferson. In contrast with the popular urge to demonize the enemy, their native characters are passionate, smart, and fiercely loyal to their friends.

A decade later came the great burst of dissent that was Transcendentalism. Ralph Waldo EMERSON, Henry David Thoreau, Margaret Fuller, and Walt WHITMAN, four leading Transcendentalists, were all radical thinkers of the nineteenth century. Emerson was barred from speaking at Harvard after he gave his "Divinity School Address" (1838), a graduation speech for new ministers in which he denied miracles, saying that Christ used the term miracles because "he felt that man's life was a miracle, . . . and he knew that this daily miracle shines." Emerson also said that all humans are divine and that Christ is God only in the same way that all of us are. Influenced by Eastern religions, Emerson posited an Over-Soul, rather than the God of the Bible. In "Nature," he argues that we are all "part and particle of God." Although the Transcendentalists reject the biblical God, they do believe in the "unseen in the seen."

Transcendentalists were not rationalists (see RATIONALISM). They were, however, social radicals. Thoreau wrote *Resistance to Civil Government* (1849), the little book that became the basic text for civil disobedience, first influencing Mahatma Ghandi in 1906 and later Martin Luther King Jr. in the 1960s. In this long essay, Thoreau declares that the strong individual will follow a "higher law" of his own devising when the civil law goes awry. "Unjust laws exist: shall we be content to obey them . . . or shall we transgress them at once?" King would quote Thoreau a hundred years later in his "Letter from Birmingham Jail" as he agrees that, when a law is unjust, "the true place for a just man is also a prison." Thoreau himself went to jail for one night to make his point against slavery and the Mexican War. In *Walden* (1854), Thoreau critiques capitalist values by stating that people don't own property as much as property owns

them. "The mass of men lead lives of quiet desperation," he tells us in chapter 1, "Economy," because they work for wages or work to develop property, losing their humanity in the process.

Among the Transcendentalists, Margaret Fuller was the only prose writer who considered women equal to men and equally in need of a revolution in their lives. In *Woman in the Nineteenth Century* (1845), Fuller calls for a new social structure in which women can be fully human, not defined by marriage. Until society gives women full human rights, she says in "The Great Lawsuit," strong and imaginative women like George Sand and Mary Wollstonecraft will be "outlaws." Fuller's radical vision of gender is that men and women are androgynous and should develop according to their talents. In the chapter titled "The Great Radical Dualism," she calls on women to forgo marriage until they become "units" in themselves. She declares "celibacy as the great fact of the time" as women struggle to develop themselves.

Unlike Emerson and Thoreau, Walt Whitman embraced the idea of equality for women. His *Leaves of Grass* (1855, 1881), a cycle of poems with a preface, celebrates egalitarianism of all kinds. In "Song of Myself," Whitman equates senators with slaves and the working poor. He "celebrates" women, blacks, Native Americans, the sick, the mentally deranged, sailors, farmers, and seamstresses. He "sings America" as he sings himself: "Of every hue and caste am I, of every rank and religion" (sec. 16). Whitman also introduces a liberal view of sexuality, a daring idea for the Victorian nineteenth century. He "sings the body electric," saying, "I am the poet of the Body and I am the poet of the Soul / . . . / I am the poet of the woman the same as the man, / And I say it is as great to be a woman as to be a man" (sec. 21). Likewise, Whitman confronts death with a positive view: "All goes onward and outward, nothing collapses, / And to die is different from what any one supposes, and luckier" (sec. 6); "It is not chaos or death—it is form, union, plan—it is eternal life—it is Happiness" (sec. 50). This is not rationalist, but it is radical.

In this poem, Whitman is outspoken on religion. "Divine am I inside and out, and I make holy whatever I touch . . . / The scent of these arm-pits aroma finer than prayer, / This head more than churches, bibles, and all the creeds" (sec. 24). Whitman puts himself outside religion by embracing all forms, from "Making a fetich [*sic*] of the first rock or stump," to "minding the Koran," to "Accepting the Gospels." But he is with the "doubters," too (sec. 43). As to God, he tells us, "Be not curious about God / . . . I hear and behold God in every object, yet understand God not in the least, / Nor do I understand who there can be more wonderful than myself" (sec. 48). At last he says, "It is time to explain myself / . . . I launch all men and women forward with me into the Unknown" (sec. 44). This is the ultimate affirmation of radical thought.

The 1840s and 1850s are considered the romantic era in American literature. Of the romantics, the writer most clearly an unbeliever is Herman Melville. Like the Transcendentalists, Melville admitted the unseen behind the seen, but what he saw was "the blackness of darkness." Raised in the Calvinist tradition, Melville wrote *Moby Dick* (1851) with a religious question in mind: Might the Calvinist God represent all "the demonism in the world"? The symbol of this god is Moby Dick himself. Ahab, the egomaniac captain of the *Pequod*, identifies "all evil" with the white whale. At the end of the novel, when Ahab strikes at the whale with his harpoon, he cries, "[T]o the last I grapple with thee; from hell's heart I stab at thee." Melville's first book, *Typee* (1846), brought Melville into trouble with the religious establishment because it assailed missionaries for ruining the cultures they meet and argued for religious tolerance. This tolerance is prominent in *Moby Dick*, too. Ishmael has a close bond with Queequeg, the pagan harpooneer. Ishmael reasons that since he is supposed to do unto others as he would want them to do unto him, and since he would like Queequeg to join him in his Presbyterianism, it follows that to make Queequeg happy he must join him in his religion: "Ergo, I must turn idolator," he says.

Although Melville does not address slavery in America directly, the race issue is at the fore in many of his novels and short stories, such as in "Benito Cereno" (1856), the story of a slave ship taken over by the wit and strength of the slaves. Melville consistently shows the evils of imperialism abroad and capitalism at home. His "Bartleby the Scrivener" (1856) depicts Bartleby, a clerk in a law office, refusing the dehumanizing tasks he is asked to perform. He "prefers not to" participate any longer in a system that treats him like a piece of property. One of the darkest of Melville's works, this story ends with Bartleby "preferring not" to live.

Melville's contemporary, Nathaniel Hawthorne, was not such an iconoclast, although he criticized the Puritan heritage both in his own family and in society at large. In *The Scarlet Letter* (1850), he created the great Hester Prynne, who, like Margaret Fuller, questions a social system that twists relationships between men and women. In "Another View of Hester," Hester considers how "the whole system of society is to be torn down, and built up anew." But Hawthorne recants when he has Hester return to the Puritan society that cast her out, to live the rest of her days in atonement.

Not a romantic, but writing at the same time, is Frederick DOUGLASS, whose *Narrative of the Life of Frederick Douglass* (1845) makes clear the connection between slavery and established religion. Douglass, an escaped slave, says in chapter 9 that the worst slave owners were the religious ones, with their "pretensions to piety."

Meanwhile, Protestant Christianity was the norm, and popular novelists promoted Christian ideology with its belief in the submission of women and often acceptance of slavery. Another Protestant issue was the fear of

Catholicism that grew from the massive numbers of Catholics immigrating at that time. Although some literary writers expressed anti-Catholic sentiments—Edgar Allen Poe criticized the Inquisition in "The Pit and the Pendulum" (1845) and Melville linked slavery with Catholicism in "Benito Cereno"—most anti-Catholicism arose in the popular literature. *The Awful Disclosures of Maria Monk* (1836), the purported tale of a young woman's experiences in a Canadian convent, sold over three hundred thousand copies before the Civil War. Many similar books in America had a broad audience, mainly because of the sexually explicit descriptions and sadomasochistic themes.

In the 1860s it was Emily Dickinson who questioned religion and the existence of God. Often mistakenly read as a Christian writer, Dickinson remains a prominent doubter in American letters. Dickinson's poems, deceptively simple, ask deep questions. In Poem 501 ("This World Is Not Conclusion"), the speaker runs through the arguments for an afterlife then ends with the line, "Narcotics cannot still the Tooth / That nibbles at the soul—." The well-known "I heard a fly buzz when I died" (poem 465) questions what happens at the moment of death. A dying person expects "the King" to appear and instead "there interposed a fly," the last vision not God but an insect, buzzing. Dickinson is skeptical of most "truths" she is handed. "I like a look of agony," one of her speakers says (poem 241), "Because I know it's true—. / Men do not sham convulsion, / Nor simulate, a Throe—." It is ironic that Dickinson's poetry, which ruthlessly uncovers religious hypocrisy and is keenly skeptical, now sells as light reading.

The romantic era ends with the Civil War. From that point onward, most writers are realists. Mark Twain (see CLEMENS, SAMUEL LANGHORNE) was a realist who satirized "sivilization" and religious humbug. In *The Adventures of Huckleberry Finn* (1884), a scoundrel at a camp meeting claims to be a missionary and bilks the fervent crowd, the Duke and the King pretend to be religious men even as they steal gold from a bereaved family and sell a whole family of slaves downriver, and Huck Finn determines to go against what civilization has taught him: He will try to save his slave friend Jim. If it's wrong to steal a slave out of slavery, he decides, "Then I'll go to hell!" In this novel, too, the Grangerfords pray every night and take their guns to church every Sunday, yet participate in a feud that kills children for "honor's" sake. Twain also wrote *Letters from the Earth* in 1909, a collection of humorous pieces of religious skepticism that were published posthumously.

In the last decade of the nineteenth century, realism turned to naturalism, with such writers as Stephen Crane and Theodore DREISER writing about humanity's lack of free will. In the wake of Charles DARWIN and Karl MARX, our lives seemed determined by biology and our economic class. In Crane's "The Open Boat" (1897), the narrator, a shipwreck survivor, is so frustrated that he "wishes to throw bricks at the temple." But at last he realizes that "there are no bricks and no temples." One of the most striking images in Crane's *The Red Badge of Courage* (1895) is of a dead soldier sitting under a beautiful tree, being devoured by insects. Naturalists understood the indifference of nature and refused to hold to a religious belief in contradiction of what they saw. However, Crane, like Melville before him, argued for the positive value of "the subtle brotherhood of men."

Similarly, Theodore Dreiser argued against free will by showing the role of chance and "chemisms" in our actions. In *Sister Carrie* (1900) a mixture of lust, greed, and chance drive a man to steal the money that will be his downfall. *Sister Carrie* was denounced as a godless book because Carrie, a "fallen woman" moving from man to man, successfully climbs the social scale. Another such success is Undine Spragg, in Edith Wharton's *The Custom of the Country* (1913), a skeptical analysis of capitalism and romance in America. The end of the nineteenth century brought Kate Chopin, ostracized because of her dissenting opinions about women, sex, and motherhood. It also produced Charlotte Perkins GILMAN, whose "The Yellow Wallpaper" (1892) is an exposé of "the rest cure" and society's repressive expectations of women. Gilman later wrote *Women and Economics*, a radical economic analysis.

At the turn of the century, W. E. B. DUBOIS wrote *The Souls of Black Folk*, which includes an indictment of the established religions in America that perpetuate racial discrimination and of a political system that allows some people to grow rich on the backs of the poor. Socialists Jack London and Upton SINCLAIR (*The Jungle*, 1904) wrote their critiques of capitalism then, also.

The Twentieth Century: Modernism, Postmodernism, and Ethnic Literature. Of all the centuries in American literature, the twentieth can be named the century of unbelief. Beginning with the modernists from the 1920s to the 1940s, a general skepticism swept American letters. World War I undermined our political illusions, and science showed how our biology, our subconscious drives, and our social class control us. With Friedrich NIETZSCHE, the modernists agreed that "God is dead." Many modernists became expatriates, shunning American consumerist values and feel-good religion. Among the poets, T. S. Eliot depicts the emptiness of twentieth-century life in *The Waste Land* (1922), which ends with the Hindu precepts: Give, Sympathize, and Control. "H.D." (Hilda Dolittle) likewise turned away from Christianity to consider Egyptian religions in *The Walls Do Not Fall* (1944), and Ezra Pound studied the moral systems of the Chinese. Robert Frost (who stayed in America) is, like Emily Dickinson, often misread as a nature poet. However, poems like "Design" (1922) go beneath nature to ask an ultimate question: In this case, what would lead a white moth to a white flower in order to be killed by a white spider? "What but design of darkness to appall?— / If design govern in a thing so small."

Wallace Stevens suggested that there is no design other than the design an artist makes. In "The Idea of Order at Key West" (1936), chaos is ordered by a woman singing, emblem of the poet creating order through language. In the satiric "next to of course god america i," e. e. cummings used language play to explore the junctures among consumerism, patriotism, and religion.

In fiction, Ernest Hemingway posited a "code hero" instead of a set of religious values. "The Snows of Kilimanjaro" (1936) deals with a man dying for an absurd reason, but dying with dignity, facing the errors of his life with poise, even as the hyenas approach. Taking a different tack, Katherine Anne Porter wrote "The Jilting of Granny Weatherall" (1935), in which Granny, confidently Catholic, discovers at the moment of death that she is jilted when God does not show up. Granny stands up to the situation, saying, "there's nothing more cruel than this—I'll never forgive it." In these same years, Sinclair LEWIS wrote *Elmer Gantry* (1927), a satiric portrayal of a preacher, and Djuna Barnes questioned gender roles in *Nightwood* (1936).

If modernism connotes despair and disillusionment because there is no central truth, postmodernism connotes joy for the same reason. With no truth, there is no hierarchy. Relativism becomes "infinite play" for the postmodernists, and life is a game. Absurdists like Edward Albee (*Who's Afraid of Virginia Woolf*, 1962) saw the dark humor of meaninglessness. Postmodernists turned meaninglessness into play. Thomas Pynchon's *The Crying of Lot 49* (1966) has Oedipa Maas search for the "truth" about an elusive and secret postal service, her quest leading her into wild company and hilarious scenes. The search, of course, ends nowhere. An offshoot of postmodernism in the 1960s and 1970s was "metafiction," fiction that plays a game with literary convention. Metafictionists like John Barth in *Lost in the Funhouse* (1968) were so far beyond worrying about meaning that they questioned even the last stronghold of the serious literary writer—the moral effectiveness of literature. Metafiction shows how meaning deconstructs before it begins.

While the postmodernists were arguing that nothing has meaning, the civil rights era of the late 1960s brought about a countermovement. Blacks in America had been skeptical about traditional religion and its attendant social values from the beginning, since Christianity was the religion of the slave owners (see AFRICAN AMERICANS, UNBELIEF AND). By the mid-twentieth century, many black writers saw that the cross had become the symbol of the Ku Klux Klan and the profit motive had built the ghettos and fueled lynchings. Richard WRIGHT, Langston HUGHES, and Ralph Ellison, African American writers of the 1940s and 1950s, wrote passionate denunciations of American society in such works as *Invisible Man* (1952) and *Native Son* (1940). All three dabbled in communism until they discovered that it was as racist as American capitalism was. By the time the riots occurred in the long hot summers of the late 1960s, black writers had stopped trying to assimilate to Euro-American ideals and had created the Black Arts Movement. This movement called for a new aesthetic that would destroy the old belief systems and imagine a new literature and a new culture based on black experience and community.

An upsurge in literature by marginalized ethnic groups began soon after. The Black Arts Movement led to the Native American Renaissance, which in turn opened the door for Asian American and later Latino writers. The writers on the cutting edge of American literature today come from these ethnic groups and from the gay community (for instance, David Hwang with *M. Butterfly* [1988] and Terrence McNally with *Andree's Mother* [1990]). These authors reject the mainstream American values that claim anyone "different" is wrong. Instead, they work from a value system born of their home cultures. Native American writers like N. Scott Momaday in *House Made of Dawn* (1968) and Leslie Marmon Silko in *Ceremony* (1977) describe a belief system that is not Christian but Navajo or Laguna Pueblo. For Native American writers, there is another plane of existence that affects our own, and the trickster, the ancient transformer/bringer of chaos, is alive and well. This is unbelief turned on its head. Likewise, Nobel Prize winner Toni Morrison wrote *Beloved* (1988), in which the title character is both woman and ghost. She represents the "60 million" who were enslaved. Maxine Hong Kingston has ghosts in her novel *The Woman Warrior* (1975), based on the Asian tradition, as does August Wilson, the African American playwright, in *The Piano Lesson* (1990). All of these works argue for a radical restructuring of the American value system and create new forms for American literature.

Obviously, "unbelief" in American literature is a complex consideration. But unbelief in some form has been a defining concept from the beginning.

KATHLEEN DE GRAVE AND EARL LEE

AMERICAN RATIONALIST. For half a century, the US periodical publication the *American Rationalist* has dared to criticize the absurdity of religious beliefs and to defy tradition, convention, church, and state.

Its founding publisher was Rationalist Publications, a nonprofit publishing venture established to promote the rationalist movement (see RATIONALISM). *American Rationalist* was envisioned as a channel for ideas, suggestions, problems, and solutions that would further the movement. The first editor was Arthur B. Hewson of Chicago. The premiere issue in May 1956 featured a photo of the Freie Geminde Building in St. Louis, former home of a German-speaking FREETHOUGHT group (see FREIE GEMEINDEN).

The publication was first produced and distributed from Chicago and was later moved to St. Louis. A dedi-

cated group of rationalists agreed to use their own resources to keep the publication afloat until it was self-supporting. It has always been a shoestring operation. In time, enough donations and bequests were contributed to assure continued publication while keeping subscription rates at very affordable levels.

Over the years the publication had several editors, including Edd Doerr, Walter HOOPS, and Eldon Scholl. Of note as editor was Gordon STEIN, who brought the magazine an edgy character by including articles on biblical criticism and little-known historical freethinkers. The current editor, Kaz Dziamka, has continued this practice.

Another goal of the *American Rationalist* was to provide a book service offering rationalist books, pamphlets, tracts, and other literature by mail order. Walter Hoops ran this service for many years, using its earnings to support the organization.

From the beginning *American Rationalist* was a low-tech, volunteer operation. For many years Eldon Scholl and his wife, Norma, prepared each issue for mailing from their home using typed name sheets photocopied onto labels. After Scholl died, the Rationalist Society of St. Louis did the work as a group taking an afternoon folding, gluing, and sorting to get them ready for mailing.

In 1996 ownership of the *American Rationalist* was transferred to the Center for Inquiry, where it should remain a viable publication for many years to come.

BARBARA STOCKER

AMERICAN RATIONALIST FEDERATION. The Jan Hus Memorial Hall of Chicago provided the venue on November 19–20, 1955, as twelve organizations joined efforts in the cause of RATIONALISM. Several ethnically German groups from Milwaukee and St. Louis supported this effort, quickly joined by Czech rationalists. The constitution of the American Rationalist Federation (ARF) stated that its purpose was "to coordinate on a national scale the efforts of local, autonomous, Rationalist, Secularist, FREETHOUGHT and like-minded organizations in preserving the principles of separation of church and state and to promote Rationalism, which is defined as the mental attitude which unreservedly accepts the supremacy of reason and aims at the establishment of a system of philosophy and ethics verifiable by experience, independent of all arbitrary assumptions or authority." The formation of the ARF was reported in the first issue of the new journal, the *AMERICAN RATIONALIST*, in May 1956. There was no formal connection between the ARF and the journal, though over the ensuing years reports of ARF activities and conventions regularly appeared in its pages, usually authored by Eldon Scholl of St. Louis, where the ARF had its headquarters in that city's Freie Gemeinde building (see FREIE GEMEINDEN).

The ARF's conventions were a focus of its work, and prominent activists were often the featured speakers. In 1962 Madalyn Murray O'HAIR gave a spirited defense of materialism; but by 1965 the ARF had withdrawn its support of O'Hair's efforts, alleging a lack of information regarding her finances. In that same year, the ARF established the Foundation of Rational Endeavor, to provide material support to educational work. The 1968 convention featured a talk by H. B. Dodd, an African American who had initiated a series of radio broadcasts in the cause of humanism in Beaumont, Texas. The foundation supported his project, but was later critical because of a lack of information on contacts made via the broadcasts. Occasionally, ARF meetings attracted sizable numbers; in 1969, some six hundred attended a debate on EVOLUTION and related topics between a Harding College professor and a rationalist.

But the next year, as an editorial in the *American Rationalist* lamented, delegates from only three organizations showed up in St. Louis, "and their reports were on the pessimistic side. Membership is falling off and new adherents are hard to find, especially among the two main ethnic groups represented in the AFR: the Czechs and Germans."

Even so, the *American Rationalist* continued to appear steadily. By the late 1970s it was reporting on the growth of the Freedom From Religion Foundation (FFRF), which had emerged in a split from O'Hair's American Atheists. So while the ARF was slowly dwindling, other similar organizations were rising to the fore. In 1987, seventy-two people from ten states registered for the annual convention. But shortly afterward the ARF apparently ceased to exist, though the Rationalist Society of St. Louis continued to operate on a local basis.

In its thirty years, the ARF sustained the rationalist cause under difficult circumstances, from its foundation in the middle of the McCarthy era through the turbulence of the 1960s. Notable among ARF officers were Walter HOOPS and Eldon Scholl; their deaths paralleled the end of the organization, though their latter years were brightened by the vitality of the FFRF, the Council for Democratic and Secular Humanism (later the Council for Secular Humanism), and, later, the Atheist Alliance.

FRED WHITEHEAD

AMERICAN SECULAR UNION. In October 1885 the NATIONAL LIBERAL LEAGUE (NLL) met in Cleveland, Ohio, and renamed itself the American Secular Union (ASU). It had been the intention of the league to become a voice for moderate secular opinion (see SECULARISM) in America. This had not happened, largely thanks to successful stereotyping of secularists as radicals by religious rivals. Organizers hoped the new name would reassure middle-of-the-road Americans that the organization was respectable. The word *secular* was then at the height of its authority and implied sensible, nonradical views on issues like the separation of church and state. Robert Green INGERSOLL, who had resigned from the NLL, was

persuaded to return as the president of the newly formed ASU. The high point of his tenure was the presentation of his address "A Lay Sermon" at Chickering Hall, New York, at the ASU's second congress in 1886.

Though anxious to claim the middle ground, the ASU was loyal to its progressive ethos when it elected Mattie KREKEL as vice president in 1885, noting that women "have to suffer a little more punishment than men, being amenable to social laws that are more exacting and tyrannical than those passed by Legislatures." But the real power behind the reformed organization was Samuel Porter PUTNAM, who served as the group's president and secretary at various times.

One of the ASU's greatest successes was a legal suit brought against the Catholic archbishop of Chicago, who was found to have directed public funds to sectarian institutions. The church had to repay what was then the enormous sum of $60,000. These successes were not without cost, however, because they only made more difficult the attempt to shake off the negative public stereotype of freethinkers (see FREETHOUGHT) as radicals. When the ASU met in Pittsburgh in 1888, its leaders narrowly avoided arrest on the grounds of their unbelief. At that congress, members elected the former Presbyterian minister Richard Westbrook as president. Westbrook oversaw the publication of a manual of morality called *Conduct as a Fine Art*, by N. P. Gilman (father of Charlotte Perkins GILMAN) and E. P. Jackson.

In 1891 the radicals, tired of what they saw as a pointless policy of trying to appease the clergy, broke off, and founded a rival freethought body in Chicago. This led to the intervention, once again, of Samuel Putnam, who effected a union of the ASU and another group, the Freethought Federation, in 1894. While Putnam remained active, the ASU & FF—as the organization was now known—achieved a relatively high profile. Putnam's greatest political success was his effort to defeat an 1896 proposal to alter the US Constitution by inserting a mention of God. Putnam's speech before the Joint Judiciary Committee of the House on March 11 of that year helped to kill the bill, a fact his Christian opponents acknowledged.

The untimely death of Putnam in December 1896 spelled the end of the ASU & FF as a significant force in American society. It continued as a freethought organization for another twenty years, largely due to the tireless leadership of John Eleazer REMSBURG as president and E. C. Reichwald at secretary. After the deaths of Remsberg and Reichwald in 1919, the organization withered away.

BILL COOKE

ANARCHISM AND UNBELIEF. Anarchism and unbelief are inseparable wherever capitalism, private property, social hierarchies, or slavery are justified by theology.

Being attractive to people who question any prevailing hierarchy, anarchism can coexist with atheistic or dissenting religious views, and in both cases has been in a continuous conflict with organized religion. In 1609 British investors drafted Laws Divine, Moral, and Martial, providing for the torture and execution of their personnel in Virginia and Bermuda who were caught escaping from plantations to join the anarchistic native societies of those lands. In Boston during the 1630s the Antinomian intellectual Anne Hutchinson was absolutely devoted to Christianity, but in Monday-night meetings at her home she discussed the previous day's sermon with neighbors, and took the anarchistic position that any person who was with God was equal in all ways to any other person (male or female) who was with God. With her obvious intellectual eminence adding to the displeasure of Puritan authorities, Hutchinson endured a humiliating trial, house arrest, and then banishment from the colony. Views similar to hers were developed in the fight against slavery during the 1830s, by then usually called Immediatism, or the immediate and direct government of God over each human being with no intermediary such as a professional clergy or state institutions. This meant that a master usurped the authority of God by making moral choices for a slave, and it defied government authority. William Lloyd Garrison professed "nonresistance" as a guiding principle for abolitionists: the New Testament forbids the use of force (counseling instead that believers "turn the other cheek"), government is upheld by force, and thus a Christian must abstain from government. The fact that the New England Non-Resistance Society (of which Garrison was the leader) allowed infidels among its members was as controversial among abolitionists as its inclusion of women and Negroes.

Most important nineteenth-century anarchist theorists agreed that people acquire the habit of obedience to the state from the persuasion of theistic religion. Mikhail BAKUNIN wrote that "there is not, there cannot be, a State without religion," and also that "if God existed, it would be necessary to abolish him." Pierre-Joseph PROUDHON wrote that "if God exists, he is Man's enemy." Both viewed the belief of privileged classes that they are nearer to or more favored by God as the chief pretext for their exercise of human authority. None of them, however, opposed freedom of religion: it was the monopoly of theology that presented a societal problem. Max STIRNER, whose 1845 book *The Ego and His Own* has remained a foundation-stone of anarchist individualism, wrote, "I no longer do anything for [the world] 'for God's sake,' I do nothing 'for Man's sake,' but what I do, I do 'for my sake.'" Stirner felt that he was entitled to overthrow all deities "if I can. If I cannot, then these

gods will always remain in the right and in the might against me." He held that religious thought was just one of the avenues by which laws are created, along with the concept of "rights" brought up in popular revolution. His egoism rejected anything that made laws, because all laws created a "sacred" boundary, interfering with the interests of the individual.

The French anarchist outlaw known by his maternal surname, Ravachol, had a violent career of reprisals against state violence that included the strangling of an elderly hermit-monk who hoarded money. In 1892 he walked to the guillotine singing the anticlerical anthem (see ANTICLERICALISM) "Pere Duchesne," but the blade fell as he sang its penultimate verse: "If you want to be happy, god damn it, / hang your landlord, cut the priests in two, god damn it! / Knock the churches to the ground, bloody god! / bury the good god in shit, god damn it!" The song is still popular today among French anarchists.

Jewish anarchists of the late 1880s were prominent in a public antireligious campaign, with atheist-Talmudists lecturing against the religion and holding Yom Kippur Balls on that most solemn holiday when all nonreligious activities halt. This developed from a more discreet tradition by which radical groups held secular social gatherings so there would be something else to do on the high holidays other than stay home or pray. Taking it a step further, in London and several US cities they announced public dancing and drinking parties for which they printed special atheist brochures written by gifted anarchists including the songwriter David Edelstadt. The balls drew violent opposition from religious Jews and suppression by authorities through the midnineties, yet Jewish anarchists were involved in atheist events on high holidays as late as 1905. Speaking at some of the Yom Kippur Balls was the (non-Jewish) German anarchist leader Johann Most, whose popular 1883 pamphlet "The God Pestilence" uses his typically harsh language: "If a person is once in the clutches of the priests, his intellect becomes barren . . . and instead, religious maggots and divine worms wriggle through his brain. He resembles a sheep that has the staggers."

Anarchist novelists and playwrights have produced masterful works of unbelief. Examples include the autobiographical novel *Sebastien Roche* (1890) by Octave Mirbeau, which describes a boy student at a Jesuit school who is raped and psychologically devastated by a priest. More recently the novel *La Petite Écuyère a Cafté* (1996) by Jean-Bernard Pouy, whose villains are murderous Catholic antiabortion crusaders undone by an independent anarchist investigator, began the "Le Poulpe" series of dissident pulp fiction by hundreds of (often anarchist) authors. Other examples use an anarchist but nonatheist plot, such as Ursula K. Le Guin's science fiction novel *The Word for World Is Forest* (1976). The people of a certain planet repel an invasion by capitalist plunderers who have enslaved them. One of the forest dwellers temporarily becomes a god, only for the period when the rebellion and a leader are necessary. After the war, he returns to his life with no title or special status.

Turning to theater, Octave Mirbeau's debut as a playwright was *Les Mauvais Bergers* (The bad shepherds, 1898). The lead character is an anarchist militant who leads a long and difficult strike. The workers turn against him and are about to lynch him on a "Calvary," when his lover, Madeleine (played by Sarah Bernhardt), pleads for his life and turns the workers back to the strike, which ends in a bloodbath. The plot depicts all leaders (religious, capitalist, political, and even anarchist) as similarly bad. One year later, Mirbeau's dedication to the novel *Torture Garden* says it again: "To the priests, the soldiers, the judges / to those people who educate, instruct and govern men / I dedicate these pages of Murder and Blood." The intense interest of anarchist critics and theater groups was critical in promoting the iconoclastic playwright Henrik Ibsen to international audiences.

The explicitly atheist-anarchist songs of the Yiddish "sweatshop poet" David Edelstadt were so popular, and the man himself so deeply mourned after his death in 1892 at age twenty-six of tuberculosis, that there were Edelstadt singing clubs in many cities for some sixty years after his death. Voltairine DE CLEYRE was one among many Anglophone anarchist-FREETHOUGHT poets. Her "Nameless" (1889) gave voice to a desperately poor woman who has already lost her husband and baby son who, on her own deathbed, ridicules a minister who has come "to pray my soul through the gates of gloom." She asks the minister, "[W]ould you care to preach for seventeen hours at thirty-five cents a day? / It wasn't often I'd make that much, for sewing without a fire, / in dead of winter, is fearful work, and your stiffened fingers tire." In her last minute of life she says, "No! Your prayers would be useless. I asked for bread, and your Christ gave me a stone."

After the 1901 killing of US president William McKinley by Leon Czolgosz, an emotionally depressed workingman who had attended a few anarchist meetings, religious leaders launched furious attacks against anarchists. Among the countless examples was Rev. Russell H. Conwell, leading Philadelphia Baptist and founder of Temple University, who said from his pulpit that "either the anarchists must be exterminated from the country or the government must die. There is no middle ground. . . . We must keep out of the country, or send out of the country, or hang from the gallows every man who does not believe in a government founded on the Ten Commandments and the moral law established by Jesus Christ. He has no right to live, he is an enemy to Society."

Anticlerical anarchism colored the economic depression of 1907–1908. On February 23, 1908, Giuseppe Alia, a poor Sicilian anarchist living in Denver, shot a Catholic priest dead at the altar after spitting the com-

munion wafer to the floor. Alia had been driven from his village and family for his ATHEISM, and the dead priest was wearing "scourges" (a girdle and armlets fitted with hooks) to continuously mortify his flesh. In the preceding weeks, rallies of unemployed men in Chicago and Philadelphia had been attacked by police and anarchists needlessly arrested. Then, on March 2, an apolitical Russian Jew named Lazarus Averbuch was killed in Chicago, on the assumption that he was an Italian anarchist. This was only a moderately high point in an age when anarchist scares (often involving the clergy) were commonplace in mainstream daily papers.

The struggle between secularists and the church for control over education climaxed with the martyrdom of anarchist Francisco FERRER, the guiding spirit of the International League for the Rational Education of Children and head of Barcelona's Escuela Moderna. After a ruthless campaign against Ferrer and his work, Catholic and Spanish authorities conspired clumsily to frame him for involvement in an insurrection. His execution on October 13, 1909, sparked worldwide outrage (with demonstrations and riots in many cities), and the educator became a clear martyr for his cause. The affair intensified the anticlerical movement (see ANTICLERICALISM); Ferrer Modern Schools were established by anarchists all over the world, most successfully in the United States. Ferrer's anarchism, however, was itself a bone of contention within the secular movement, with shouting matches erupting between pro-Ferrer speakers and anti-anarchists at secularist meetings.

Other episodes in the war between Spain's anarchists and the church included the battles between Catholic-run "Free Unions" (puppet unions whose grievance process was prayer) and anarchist unions from the early 1920s, marked by many assassinations on each side. The early months of the Spanish Civil War in 1936 saw extreme actions on both sides. In the "anticlerical fury," several thousand priests (and some nuns) were lynched in the Republican zone, most frequently in areas held by anarchist militias. Crowds spontaneously set fire to churches; the tombs of clergy were opened, the nuns' skeletons propped against walls with cigarettes in their mouths so as to mimic prostitutes; the skull of one saint, removed from his casket on the altar, was used as a soccer ball in front of the church bearing his name. In the Nationalist zone, priests wearing sidearms demanded "confessions" from anarchists and other "reds" who waited to be executed by the thousands. To this day there are fierce denials that one's own side did these things, but the evidence is ample.

In the early decades of the Christian-capitalist war against perceived demons under the Comstock Postal Act of 1873 (see COMSTOCK, ANTHONY, AND UNBELIEF), the best known among its thousands of targets were anarchist writers, editors, and publishers for discussing human sexuality on rationalist terms (see SEX RADICALISM AND UNBELIEF). This included the arrests (sometimes leading to prison terms) of Lois WAISBROOKER (1894, 1902), Ezra HEYWOOD (1878, 1882, 1890), and Moses HARMAN (1887, 1890, 1896, 1905), who published the weekly anarchist-freethought journal *Lucifer, the Light-Bearer*. LILLIAN HARMAN and Edwin C. Walker were imprisoned in 1887 in Kansas for declaring a "free marriage" to each other on their own authority.

The French individualist-anarchist André LORULOT was also a major proponent of atheism. He published and edited newspapers including *l'Action Antireligieuse* (Antireligioius action), *La Libre Pensée* (Freethought), and the satirical monthly *La Calotte* (double meaning: the clergy/the slap), which began as pamphlets printed clandestinely under Nazi occupation. Lorulot served in official capacities in national and international freethought organizations before and after World War II.

Some anarchists understand famous religious personalities as anarchists. Ross Winn of the southern United States believed that the teachings attributed to Jesus were generally similar to his own moral values, but that church and state had twisted them into instruments of control. "I suppose some people will object if I call Jesus an anarchist," Winn wrote in 1902, "but I am sure the whole world would call him that if he lived today, and preached such doctrines." In some cases, distinct varieties of anarchism develop around a Jesus fixation and may blur the point at which the freethought ends and religion begins. The writings of Lev TOLSTOY in his late years had this effect within the anarchist movement, attracting many distinguished thinkers and having a vast influence worldwide against violence, militarism, and patriotism. Another major anarchist leader who held mystical, Christian-derived convictions was the French geographer Élisée Reclus, though his convictions never conflicted with his anarchism. Also, the Catholic Worker movement is usually understood to be anarchist. Founded by the lay Catholics Dorothy Day and Peter Morin in 1933, members of that faith-based antipoverty movement today are not connected in any way to the Vatican, and many have no Christian background whatsoever. The movement consists of small, task-oriented groups with a major focus on nonviolent methods. A group needs no permission to call itself Catholic Worker and establish an operation under the name.

Anarchism has always been generally atheistic, with most of its periodicals holding secular editorial positions. The idea is commonly identified, in many languages, with the slogan "No God, No Master."

ANCIENT WORLD, UNBELIEF IN. The earliest traces of unbelief are very difficult, if not impossible, to detect prior to the advent of writing at the end of the fourth millennium BCE in the ancient Near East. Based on observations of nonliterate and premodern societies, the anthropologist Mary Douglas concludes that persons we would recognize as secularists or humanists probably existed in every type of human society, modern or ancient (see SECULARISM; HUMANISM). In this article we shall discuss unbelief in specific religious traditions (see ATHEISM)—as well as a more general unbelief in supernatural forces, entities, and causes—within the major cultural areas of the ancient Near East, from the dawn of writing to the fall of the Roman Empire.

Mesopotamia. Mesopotamia, the land between the Tigris and Euphrates rivers in what is now Iraq, contains some of the earliest known written records of human thought about religion, dating to the end of the fourth millennium BCE. The first extensive description of a seemingly nonreligious life is found in a collection of tablets called *Ludlul bēl nēmeqi* (I will praise the lord of wisdom) dated to the middle of the second millennium BCE. The work apparently describes the suffering of a sick man, who complains that his religious rituals are not having the expected results:

> I called to my god, but he did not show his face,
> I prayed to my goddess, but she did not raise her head.
> The diviner with his inspection has not got to the root of the matter,
> Nor has the dream priest with his libation elucidated my case.

The author then complains that he is being treated like someone who does not worship the gods at all:

> Like one who has not made libations to his god,
> nor invoked his goddess at table,
> does not engage in prostration, nor takes cognizance of
> bowing down; From whose mouth supplication and
> prayer is lacking, who has done nothing on holy days,
> and despised sabbaths, who in his negligence has despised
> the gods' rites, has not taught his people reverence and worship,
> but has eaten his food without invoking his god.

Even if the author is not an atheist, he seems to recognize the existence of people who seemingly live a nonreligious life. The author himself suggests that not all religious rituals may work in solving real-world problems, illness being one of the most intractable among them. Otherwise, no known writer in ancient Mesopotamia made any coherent defense of unbelief in the gods.

Egypt. Ancient Egypt had a complex civilization by the end of the fourth millennium BCE. No one will mistake Egypt for a secular society, given the myriad religious practices uncovered through archaeology. Perhaps best known are Egypt's extensive royal funerary rituals,

which signaled a deep belief in the afterlife. The famous gods of Egypt include Osiris and Isis, not to mention a legion of minor deities and demons. However, even in such a religious environment, there are indications that some people could look at the world without reference to the supernatural.

One example of apparent NATURALISM is the Edwin Smith Surgical Papyrus, named after an American collector who reportedly acquired it in 1862. James Henry Breasted, the eminent Egyptologist who published a definitive edition of the Papyrus, dates the current copy to the seventeenth century BCE, and says: "In this document, therefore, we have disclosed to us for the first time the human mind peering into the mysteries of the human body, and recognizing conditions and processes there as due to intelligible physical causes." The papyrus, indeed, lists physical conditions in a very objective manner, and then prescribes remedies, usually without any reference to supernatural phenomena.

A more complex case of unbelief is illustrated by IKHNATON, the Egyptian pharaoh who around 1375 BCE decided to abandon the worship of traditional Egyptian gods in favor of only Aton, the personification of the sun. Ikhnaton built a new city, Amarna, devoted to the worship of Aton. On the one hand, Ikhnaton may have thought that Aton should be the only name used for all of the gods; or that other gods were manifestations of Aton. However, an inscription from the time of Tutankhamen indicates that Ikhnaton did not believe in all the gods. Tutankhamen boasts that he has restored all of the temples left in ruins by Ikhnaton, and vows to benefit "all the gods," perhaps a criticism of Ikhnaton's unbelief in polytheism. Otherwise, we find no systematic defense of unbelief in the supernatural in ancient Egypt.

Israel. Frank Moore Cross, the famed Harvard biblical scholar, has argued that ancient Israel represents a trend toward secularization relative to other ancient Near Eastern cultures. He cites a movement away from personifying nature and toward a more transcendent and elusive god as a mark of that secularization. While Cross may be overstating his case, there are a number of indications that unbelief was a constant concern for biblical authors. The object of unbelief, however, was not all supernaturalism, but rather specific gods, cults, or practices. In fact, in the ancient Near East a belief in "God" was seldom spoken of, but rather of belief in specific gods or in "the gods" as a collective.

One oft-cited verse used to support the presence of atheists in ancient Israel is Psalm 14:1: "Fools say in their hearts, 'There is no God.' They are corrupt, they do abominable deeds; there is no one who does good." However, the translation may be misleading insofar as the term translated "God" can actually refer to the specific god named Elohim. Thus, a better translation may be "A fool says in his heart, 'Elohim is not (present here).'" Nonetheless, the idea that Elohim is not present might lead logically to denying that Elohim exists at all.

Advocates of Yahweh, the principal name for the Hebrew god, had a particular problem because his characteristics and actions were similar to those claimed for another god named Baal. The latter had a much longer history in the ancient Near East, and many scholars believe that Yahweh is a Hebrew adaptation of Baal. In any case, Yahweh enthusiasts had to convince the populace that it was Yahweh, not Baal, who provided some of the benefits they enjoyed. This is clear in a complaint against Israel, personified as an errant wife, in Hosea 2:10: "She did not know that it was I who gave her the grain, the wine, and the oil, and who lavished upon her silver and gold that they used for Baal."

Another source of unbelief involved war. Many Near Eastern cultures measured the existence and effectiveness of gods by whether their worshipers won or lost wars. According to 2 Kings 18:33–34, the Assyrians, whose Mesopotamia-based empire reached its height in the early first millennium BCE, used their victories as arguments against the existence or efficacy of the gods of their victims: "Has any of the gods of the nations ever delivered its land out of the hand of the king of Assyria? Where are the gods of Hamath and Arpad? Where are the gods of Sepharvaim, Hena, and Ivvah? Have they delivered Samaria out of my hand?"

Of course, there were strategies that helped believers to cope with military losses without giving up belief in their gods. A Hebrew author might say that Yahweh was using the Assyrians as his instrument (see Isa. 10:5), or that Yahweh was angry with Israel, and so did not respond.

Prophecy was particularly crucial in proving the existence or power of favored gods. The basic premise is that only a true god could predict events with an accuracy not expected of human beings. However, the Hebrew Bible reflects how troublesome belief in prophecy could be. Consider Deuteronomy 18:21–22: "You may say to yourself, 'How can we recognize a word that the LORD has not spoken?' If a prophet speaks in the name of the LORD but the thing does not take place or prove true, it is a word that the LORD has not spoken. The prophet has spoken it presumptuously; do not be frightened by it."

The fact that the author is addressing the question of how to recognize communications from Yahweh indicates that he acknowledges the existence of a corresponding SKEPTICISM. The criterion provided by the biblical author, however, is weak because it does not address cases in which two different gods predict the same event. For example, suppose that a prophet of Yahweh predicted rain in seven days, and that a prophet of Baal also predicted the same. Using the criterion outlined above, one would not be able to distinguish which god actually provided the correct information. Others recognized that the frequency of an event should also be cause for skepticism in prophecy, as indicated in the complaint of Jeremiah, the Hebrew prophet (Jer. 28:8–9): "The prophets who preceded you and me from ancient times prophesied

war, famine, and pestilence against many countries and great kingdoms. As for the prophet who prophesies peace, when the word of that prophet comes true, then it will be known that the LORD has truly sent the prophet."

In short, frequent events, such as wars, were useless as indicators of true prophecy because they were bound to occur no matter which god's prophets predicted them. Improbable events, like peace, now were touted as better indices of true prophecy.

But even such a refinement did not end the skepticism. In 1 Kings 22, we find the story of a prophet of Yahweh named Micaiah, who usually predicts disaster for the king of Israel. Other prophets of Yahweh predict that the king of Israel will win a war with the Syrians, and Micaiah repeats that prediction. However, upon further inquiry, Micaiah reverses himself, and says that Yahweh has actually told him that the king would lose the battle. Micaiah's first prediction, therefore, was a lie. Moreover, Micaiah claims that Yahweh has actually incited other prophets of Yahweh to lie (1 Kings 22:22–23). The whole narrative appears to be an effort to address unbelief in the accuracy and/or consistency of Yahweh's prophets.

The belief that scriptures contained the word of God was also a target of biblical authors. One interesting example is in Jeremiah 8:8: "How can you say, 'We are wise, and the law of the LORD is with us,' when, in fact, the false pen of the scribes has made it into a lie?" In other words, the biblical author acknowledges that scribes could manufacture the illusion of sacred scripture. The author, however, is ultimately powerless in distinguishing true and false scripture on anything other than his own subjective opinion.

Ecclesiastes, whose authorship is uncertain but which may date to the Hellenistic era, sometimes has been hailed as a secular humanist manifesto. In some cases, the author's ideas were certainly perceived to be so skeptical that the text or translation was changed to soften that skepticism. In Ecclesiastes 2:24–25, the New Revised Standard Version translates as follows: "There is nothing better for mortals than to eat and drink, and find enjoyment in their toil. This also, I saw, is from the hand of God; for apart from him who can eat or who can have enjoyment?" Yet the Hebrew text actually says "for apart from *me*, who can have enjoyment?" (emphasis added). In other words, the author is quite human centered in his pursuit of happiness. The author of Ecclesiastes does question many commonplace beliefs. Note, for example, the author's skepticism about the afterlife (Eccl. 3:20–21): "All go to one place; all are from the dust, and all turn to dust again. Who knows whether the human spirit goes upward and the spirit of animals goes downward to the earth?" The author's question suggests that no one knows the answer about the fate of any immaterial components of one's life (or the fate of the actual physical breath that ceases at death). The only phenomenon one observes is the decomposition of bodies into dust. In fact, the author suggests that it is futile to speculate about the fate of the life-breath, and so he provides more advice in verse 22: "So I saw that there is nothing better than that all should enjoy their work, for that is their lot; who can bring them to see what will be after them?"

The book of Job, whose authorship and exact date of composition are uncertain, contains some of the boldest skeptical questions about God found in the entire Bible. The book itself is premised on the idea that Yahweh can allow people to be destroyed "for no reason" (see Job 2:3). Job, indeed, is tortured because of a wager made between Yahweh and a figure called The Satan, which should not be confused with the archenemy of God in later Christian tradition. The author does seem to advocate the idea that human beings have no right to know Yahweh's reasons, and Job is never told the reasons for his misfortune. But most scholars overlook the radical question found in Job 7:20: "If I sin, what do I do to you, you watcher of humanity?" In other words, why should the actions of a worthless lump of clay (as human beings are conceived in Job) be of any consequence to an omnipotent being? In more concrete terms, why should Yahweh care if a human being commits adultery, lies, or steals, any more than a human being cares if ants or other lower forms of life misbehave? In short, Job questions the very notion of sin itself. As such, Job may contain one of the most subversive critiques of sin found in any prior work of literature in the ancient Near East. Otherwise, biblical authors may express unbelief in particular gods and practices (e.g., Isa. 40:17–28), but none can be seen as advocating unbelief in all supernatural phenomena.

Greece. The first systematic rational and secularized philosophies appeared by the middle of the first millennium BCE in Greece, understood here broadly as encompassing areas where Greek was a dominant language of philosophical discourse and including at that time what is now western Turkey and southern Italy. Unfortunately, we usually have to reconstruct the supposed teachings of early Greek philosophers from later writers whose surviving manuscripts often actually date to medieval times. We often cannot verify that those later writers are transmitting much very faithfully. Consider the case of Anaxagoras, who is portrayed by Saint Augustine in his *City of God* as a believer in some form of an indwelling divine mind. Yet Irenaeus, another early Church father, specifically portrays Anaxagoras as an "atheist." Our survey, therefore, must be seen in light of these problems. Greece, of course, produced many philosophers of lasting influence including PLATO and ARISTOTLE. Aristotelian logic, with its emphasis on the syllogism and law of noncontradiction, still permeates modern science. Frederick Copleston, the famed Jesuit historian of philosophy, sees Plato and Aristotle as theists, but even he cannot deny that their view of theism is not always what we may envision. It is debatable if Aris-

totle's Prime Mover, the cause that set the universe into motion, is a personal god or not. Accordingly, in order to find ideas that approximate those of modern secularists, we have to look more closely at some of the lesser-known philosophers. According to CICERO, the famous Roman author and philosopher of the first century, in his *De Natura Deorum*, Diagoras of Melos and Theodorus of Cyrene (now Libya) "held that there are no gods at all." If Cicero is preserving an authentic tradition, these figures, who are usually thought to have lived before the end of the fifth century BCE, would be some of the earliest explicit atheists on record.

Naturalistic explanations for the origin of the universe are already evinced in a group of philosophers living in Ionia (now western Turkey) and known as the pre-Socratics because they were active in the seventh and sixth centuries BCE, before the rise of SOCRATES, the benchmark of Greek philosophy. Although some scholars have claimed that the pre-Socratics were opposed to all theology, the fragmentary nature of the sources should caution us against such generalized statements. The sources we do have indicate that later writers thought that at least some of these pre-Socratics advocated completely naturalistic explanations for the origin of the universe (see NATURALISM, PHILOSOPHICAL).

Thales, for example, believed water to be the primary element underlying the entire universe. In part, Thales reached this conclusion because water had the ability to become a gas when heated, and a solid when cooled. If so, the three basic states of all matter (solid, liquid, and gas) could be seen as different forms of water. In actuality, the idea that water is a primordial component of the universe can be found also in Genesis 1:1–3, and in the Babylonian work known as the *Enuma elish*, which dates as early as 1500 BCE. Both of those stories began with a chaotic mass of water that was reshaped. The difference is that Thales made no reference to gods shaping the water.

Anaximander had quite a sophisticated cosmogony, which posited that the universe arose from the everlasting motion of the *apeiron*, perhaps understood as "a huge, inexhaustible, mass stretching away endlessly in every direction." Anaximander describes something akin to a Big Bang theory in hypothesizing that this *apeiron* grew into a fiery sphere that then differentiated into the basic elements of the universe that we observe today. Anaximander also outlined a very crude theory of evolution whereby land animals originated in fish. As did many later Greek philosophers, Anaximander already postulated that the earth was suspended in space (or midair).

PROTAGORAS of Abdera is famous for an epistemology which was completely human centered, as indicated in his famous dictum, "Of all things the measure is Man." He is also credited with a frankly agnostic stance (see AGNOSTICISM) when he said: "About the gods, I am not able to know whether they exist or do not exist, nor what they are like in form; for the factors preventing knowledge are many; the obscurity of the subject, and the shortness of human life." Cicero reports that Protagoras's ideas resulted in his exile and in his books being burned. If Cicero's report is true, it could be the earliest known instance of burning the books of skeptics/agnostics in the historical record.

XENOPHANES of Colophon is famous for outlining a theory for the origin of religion that would recur in the works of Ludwig FEUERBACH, among others. Xenophanes argued that the portrayal of gods was culturally conditioned because the physical characteristics and behaviors of the gods depended on the culture in which they originated. As Xenophanes phrased it: "Aethiopians have snub-nosed gods with black hair; Thracians have gods with grey eyes and red hair." In making this observation, Xenophanes was criticizing more particularly the anthropomorphic views of the gods found in Homer and Hesiod, some of the most revered early Greek poets.

Critias of Athens is perhaps the first writer to express the idea that the gods were invented for purposes of social and political manipulation. The idea cannot actually be attributed to Critias because it is placed in the mouth of the title character in his play, *Sisyphus*, as follows: "A wise and clever man invented fear (of the gods) for mortals that there might be some means of frightening the wicked, even if they do or think anything in secret. Hence he introduced the Divine (religion). In saying these words he introduced the pleasantest of teachings, covering up the truth with false theory." This idea was later echoed by the medieval anticlerical writer named Marsilius of Padua and by a host of Enlightenment thinkers.

The existence of unbelief can also be found in accusations reported in various sources. Plutarch reports that Anaxagoras of Clazomenae, a friend of Pericles, the famed Athenian ruler, was accused of violating a decree against those "who do not believe in the gods." Anaxagoras, among other things, is reported to have denied that the sun is a god. According to Plato's *Apology*, Socrates was tried and convicted, in part, because he was teaching youth "not to believe in the gods the state believes in, but in other new spiritual beings."

THUCYDIDES exemplifies a more systematic critique of belief in written reports. He complains that people are too willing to believe in ancient reports "composed with a view rather of pleasing the ear than of telling the truth." Such a critique, of course, could also lead to unbelief in the claims of the Bible and other sacred scriptures outside of Greece. We should note that Thucydides was quite self-serving in wanting readers to believe what he wrote even though his reports are sometimes no more well substantiated than his targets of complaint.

Healthcare was an area in which unbelief in supernatural explanations was clearly manifested, especially in the corpus of works attributed to an otherwise obscure man named Hippocrates. Simple observations and analo-

gies served to promote nonsupernatural explanations for disease. For example, in a treatise on *Breaths*, the Hippocratic corpus observed that anything that made human beings suffer should be classified as a disease. Hunger was a disease under such a definition since it made human beings suffer. The treatise further observed that hunger was clearly due to a lack of food. The cure for hunger is the addition of food. By extending this analogy of hunger to other diseases, the Hippocratic corpus reasoned that all diseases were due to an excess or lack of something. The cure, therefore, is to add what is lacking and subtract what is in excess. In short, no supernatural causes or cures were even contemplated once one established that other conditions also qualified as "diseases" caused by imbalances in particular substances.

In the treatise *On the Sacred Disease*, the Hippocratic corpus leveled the most systematic attack on supernatural causation ever seen in ancient medicine. The focus is on the condition that has been identified as epilepsy, which was commonly diagnosed as a specifically supernatural disease. The author explicitly lays out his thesis: "This disease is in my opinion no more divine than any other; it has the same nature as other disease, and the causes that gives rise to individual diseases."

The attack on supernatural causation centers on the observation that there were observable conditions correlated with the incidence of the disease. For example, the author notes that the disease is more common in so-called phlegmatic people than in so-called bilious people. The author also notes that climate correlates with the frequency of mortality from the disease, with the highest tolls being in winter. If gods were causing the disease, then we would not expect that they would be deterred by the seasons. In fact, the author hypothesizes that the disease is centered in the brain.

After Aristotle, Greek philosophy developed a number of schools, some of which contributed to later secularist ideas even if these schools did not always see themselves as atheistic. The Stoics, founded by Zeno of Citium, advocated an ancient version of intelligent design in positing that the world was divinely purposed for the benefit of humanity (see STOICISM). However, Stoics also emphasized that all knowledge should be based on sense perception, something crucial to most modern atheistic scientific outlooks. A school of Skeptics, represented by, among others, Pyrrho of Elis (see PYRRHONISM) and Carneades of Cyrene, advocated agnosticism and relativism about every proposition, ethical or factual. Carneades is also credited by Cicero as controverting the idea that the earth contains features designed by the gods for the use of mankind. But the most coherent advocates of unbelief are the Epicureans, named after the Greek philosopher EPICURUS, a native of the island of Samos who founded his school of philosophy at Athens. Actually, the most prominent Epicurean author was a Roman named LUCRETIUS, whom we discuss further below. But, in general, the Epicureans centered their philosophy on achieving the highest possible happiness and quality of life. Gods exist, but they are unconcerned with human affairs and they are themselves made of material substances. Death represents simply the dispersal of the physical elements that constitute the body. Human beings should make the best of the life they have rather than be concerned about an afterlife. Thus, Epicureans approach what we would later call deists (see DEISM).

The Roman Empire. Given our overlapping discussion of Christianity in the next section, the period of the Roman Empire discussed here is mostly from the first century BCE to the second century CE. Generally, Roman philosophy was an adaptation or continuation of the varieties of Greek philosophy. Within those schools, the most prominent advocates of unbelief in traditional religion were the Epicureans. According to Cicero, who exemplified an eclectic approach to philosophy, "Epicurus really abolished the gods, but nominally retained them in order not to offend the people of Athens." Lucretius, the foremost representative of Epicureanism, devised the most systematic use of naturalistic explanations conjoined with a critique of supernatural explanations in his *De Rerum Natura* (On the nature of things). Lucretius opined that priestly groups promote belief in superstition in order to facilitate social control. Lucretius expressed hopes that if people saw the folly of divine retribution in the afterlife, then "they would have the power to defy the superstitions and threatenings of the priests."

Lucretius outlined several criticisms of common religious institutions such as temples, which were generally viewed as the home of the gods. Lucretius reasons that any gods who exist are in no need of material homes since their nature, even if material, is so different that temples would be unnecessary.

Lucretius outlined a thorough and systematic naturalistic cosmology which views the origin of the universe as the result of random physical processes. Lucretius also offers one of the first extended critiques of what today would be called intelligent design (see INTELLIGENT DESIGN THEORY), the idea that there is observable and rational evidence that the universe was designed for the benefit of human beings. Lucretius specifically observes that such an idea, popular among the Stoics, must also contend with all of the flaws that exist in the universe.

Cicero, whose work we have been quoting, was himself a theist, but he recorded in his *De Natura Deorum* the arguments of many unbelievers in the supernatural. Cicero notes that the existence of contradictory opinions among the greatest philosophers about the gods has itself been used to advocate unbelief in the gods. In order to counter the Stoic idea that universal opinion constitutes proof of the existence of the gods, Cicero claims that "there are many nations so uncivilized and barbarous as to have no notion of any gods at all." In addition, Cicero composed a systematic discussion of belief and unbelief in prophecy in his treatise *De Divinatione* (On divina-

tion), wherein he notes the importance of prophecy in establishing the existence of the gods.

In his work *On Superstition*, Plutarch, the Greek writer and priest of the temple of Delphi, condemns both superstition and atheism. For Plutarch, superstition is rooted in fear, and he claims that superstition, not "true" religion, is the real cause of atheism. The works of Juvenal, the Roman satirist, also show how more popular forms of literature could be used as vehicles for unbelief. Otherwise, the Roman Empire is another of many Near Eastern examples of governments that sponsored and encouraged the worship of the gods of the state.

Early Christianity. In the first century, a sect of Jews broke with traditional Jewish teachings and developed into a collective we call Christianity. By 476, the traditional date for the fall of the Roman Empire, Christianity had become the empire's official religion. This period is notable because it initiated the most systematic and extensive dialogue between belief and unbelief in world history. Christian apologists and their opponents set the agenda for debates that continue today. As such, these debates also sometimes contributed to unbelief in all religion. The earliest teachings of Christianity are difficult to decipher—all extant documents about Christianity come from no earlier than the second century, by which time it was already a very differentiated phenomenon. Some self-described followers of Christ believed that he was God and others did not. Some Christians believed that Christ had resurrected from the dead, and some did not. Perhaps their only common denominator was their claimed adherence to the teachings of the figure called Christ. To complicate matters, Justin Martyr, the famed early Christian father, tells us in his *First Apology* that the term *atheist* was applied to Christians to signify their unbelief in the gods of the Roman Empire. Some of the first reports of skepticism regarding Christian supernatural claims appear within the New Testament itself. Matthew 28:11–15 reports that the belief in the resurrection of Jesus was being combated by using an alternative and naturalistic explanation of body theft. The letters attributed to Paul contain many complaints of unbelief among both Jewish and Gentile listeners (see 1 Cor. 1:20–23). Throughout the New Testament there are repeated threats and complaints about unbelief even among Christians (for example, Matt. 28:17, John 20:25).

Outside of the New Testament, we find a number of important writers against religion who use Christianity as a principal example (see CHRISTIANITY, RESISTANCE TO IN THE ANCIENT WORLD). Lucian of Samosata is sometimes called the VOLTAIRE of his time because of his wide-ranging indictment of religious belief. In *The Passing of Peregrinus*, Lucian relates the story of a Cynic philosopher, Peregrinus, who experiments with Christianity but is rejected by the Christians after he apparently violates some of their regulations. Lucian complains that Christians are gullible in adopting beliefs without evidence, especially when those beliefs can lead to the very death of Christians.

One of the most important substantive attacks on Christianity is recorded in *Contra Celsum* (Against Celsus), the Christian apologetic handbook attributed to the church father Origen. Celsus was an anti-Christian and anti-Jewish writer whose origin and philosophical affiliations are still disputed. His writings did not survive; our main record of Celsus's major work, *The True Discourse*, is preserved in Origen's quotations. In addition to attacking the belief in the resurrection of Jesus, Celsus attacked a wide range of biblical beliefs with arguments that are still used today in some form. Indeed, Celsus was among the first to refute specifically the young-earth chronology of Genesis, and he posited that our eternal planet had experienced a series of cataclysms, the latter being an idea that persists in modern geology. In general, evaluating the validity of beliefs centered on their antiquity in most premodern literature. The more ancient a belief, the more credibility it had for philosophers. Celsus was no exception, and he strove to show that there were non-Christian traditions that were much older than Christianity. Celsus used extensive parallels to show that Christian claims, while historically more recent, were not unique, but rather could be seen as a type of plagiarism from or adaptation of non-Christian beliefs. In particular, Celsus cited stories of births caused by the union of gods and human women in Greek traditions (for instance, Apollo is reported to have fathered Plato after a union with his human mother, Amphictione) to counter the story of the virgin birth of Jesus. Celsus also proposed a naturalistic alternative in claiming that the Christian story was contrived to explain away Mary's sexual liaison with a Roman soldier named Panthera. Other ulterior motives are ascribed to gospel stories, such as when Celsus hints that Jesus operated some sort of sex cult because so many women were willing to follow him into deserted areas.

More direct attacks on the Christian god by Celsus centered on theological contradictions. The idea that God can do "all things," as stated in Mark 10:27, would mean that God is able to cease being God or be able to do ungodly things. An omniscient god would not have been so easily betrayed as Jesus was by Judas. An omnipotent god would not have needed an angel to roll away the stone sealing Jesus's tomb, as is claimed in Matthew 28:2. The idea that God "comes down" (see Gen. 11:5) contradicts his omnipresence, since one does not come down to where one already is present. The incarnation is incompatible with God's immutability. In all fairness, some of the skepticism evinced by Celsus can be viewed as ad hominem attacks. This would include the idea that Christianity is untrue because it derives from a religion (Judaism) that Celsus viewed as "barbarous in origin." Celsus claimed that the apostles should not be believed because they were in dishonorable professions such as tax collecting and sailing.

Elsewhere, Celsus uses the Bible's own description of unethical behavior by Yahweh and Hebrew heroes to impugn the credibility of biblical information. In *Contra Celsum* 4.33, Celsus apparently alludes to biblical reports that Abraham lied about Sarah being his sister (Gen. 12:19) and that Jacob deceived his father (Gen. 27:18–40). Accordingly, Celsus concludes that we ought not believe anything else these patriarchs say. Celsus notes the amount of unjustified violence endorsed by the god of the Bible, and he reasoned that such violence was unworthy of a loving god. From the works of Philo, an Alexandrian Jewish writer of the first century CE, we know that objections to the Hebrew Bible were already being launched on the basis of the unjustified violence endorsed therein against the Canaanites and other native inhabitants of ancient Palestine.

Justin Martyr, another important early Christian apologist, records other attacks on Christianity, especially those made by Jews. It is clear that some Christian supernatural claims were being disputed on the basis of linguistics. For example, Jewish scholars noted that many events claimed by Christians as fulfillments of biblical prophecy were actually based on misunderstanding the Hebrew text. One example is Psalm 22, which speaks of the sufferings of the author. Christians believe Psalm 22 speaks of the sufferings of Christ. However, the Book of Psalms was written, according to traditional dating, about one thousand years before Christ, and the Psalmist uses the equivalent of the English past tense to describe these sufferings. Therefore, Jewish exegetes could argue, the Psalmist could not be referring to anyone in the first century.

Most known participants in debates between Christian believers and their opponents were men. Less certain is the role that unbelief played in the work of HYPATIA, a mathematician and astronomer from Alexandria. While most available sources report her murder by Christians, it is not certain whether the cause was her anti-Christian belief, or whether it was because of her role in a rivalry between Cyril, the bishop of Alexandria, and Orestes, a government official and friend of Hypatia. In any case, Hypatia remains one of the few women who is recorded as having any sort of unbelief or trouble with Christianity in the ancient world.

Julian "the Apostate" was the last Roman emperor to attempt to dismantle the Christian empire created by Constantine. But Julian was no unbeliever; he would never have abandoned supernaturalism as he was devoted to his Roman gods. By the time of Augustine, the most important Christian theologian near the fall of the Roman Empire, most types of objections to Christianity had been voiced in some form. Nonetheless, Augustine mounted a systematic defense in his *City of God*. The ascent of Constantine, the first Christian emperor, and the subsequent rise of Catholic and Protestant kingdoms, meant that Christians increasingly moved away from debate with unbelief to persecution and suppression of unbelief for the next fifteen hundred years or so.

Conclusion. Unbelief has existed in some form since the dawn of recorded history. However, it is useful to distinguish at least two types of ancient unbelief: (1) unbelief in specific religious traditions and practices (such as unbelief in Christianity or even certain forms of Christianity); and (2) unbelief in all gods and supernatural phenomena. This also explains why the term *atheist* can have at least two meanings in the ancient world: (1) unbelief in all gods; and (2) unbelief in specific gods (for example, Romans calling Christians "atheists" because the latter did not believe in the Roman gods).

These distinctions become more significant when we realize that, while the first type of unbelief still retains belief in supernaturalism generally, it nonetheless carries the potential seeds of unbelief in all religion. The main reason is that the objections made against specific religions could often be extended to all religions. Thus, if one questions the ethics of the Christian god, then one could also question the ethics of all the gods. If one argued that Christianity was unworthy of belief because its supernatural claims could not be verified, then one could just as well extend this rationale to the claims of all religions.

Our survey reveals that all the main types of objections to religion in existence today had already been voiced by the beginning of the Roman Empire. Among the most important types of arguments for unbelief were: (1) lack of empirical evidence; (2) internal contradictions in theology; (3) alternative natural/historical explanations; (4) undesirable ethical and social consequences. Other arguments, which would not be regarded as highly today, include: (1) the "cultural" level of the believers ("barbarous" versus "civilized") and (2) anecdotes about misbehavior of adherents.

What has changed since ancient times is the quality and relative importance of some types of arguments. For example, in the vast majority of premodern literature, the antiquity of a belief was used to support its credibility. Today, "recent and up-to-date" information is usually regarded as more credible, and an old belief can be dismissed as being outdated. In the period we surveyed, women who advocated unbelief were practically invisible. Today, while their proportions are still not equal to those of men, there have been some notable women advocates of secularism. Among some ancient authors, atheism was a characteristic of uncivilized and uneducated peoples, but today atheism is not deemed to be characteristic of any nonliterate or nonindustrialized society. In almost every culture and historical period we find at least three strategies for combating unbelief: (1) civil debate; (2) apathy (in the hope that unbelief will disappear); and (3) persecution, which could take forms ranging from loss of certain rights to outright killing or exile. But while there were always instances of persecution of unbelievers, there has been nothing so sweeping and violent as the policies against unbelief expressed in

the Hebrew Bible and the New Testament, whose consequences we are still witnessing today.

Perhaps the most important lesson of all is that unbelief has persisted even amid the most ardent opposition. Epicurus and Lucretius, in particular, demonstrate that simple reason and the amount of information already available in their time were sufficient to justify a life free from presumptions of supernatural causation. The history of ancient unbelief teaches us that unbelief will probably always survive, but its level and intensity will probably depend, as it always has, on a host of factors ranging from politics to education.

HECTOR AVALOS

ANDERSON, JOHN, (1893–1962), Australian atheist philosopher. Coming from Scotland to Sydney in 1927, Anderson became the leading Australian philosopher of his time, also gaining fame as an uncompromising critic of prevailing uncritical beliefs, especially those of religion.

Anderson criticized religion not only for the content of its beliefs but for its promotion of credulity. Consider his view of the unscientific character of religious faith: "A belief from which we cannot depart, which is not founded on inquiry, but, on the contrary, stops it at its source—such a belief is credulous." That is why, he noted, the principle of Christianity is subjectivity, whereas the principle of science and of empiricist philosophy is objectivity.

In 1943 Anderson gave a reasoned address titled "Religion in Education" that led to a famous public controversy, in the course of which Anderson was condemned by the New South Wales Parliament and publicly cursed by a clergyman. Anderson's argument was that since religion seeks to close down inquiry, there is no place for it in education. At one point, for instance, he noted that when a child is told that God made everything and the child responds, "But who made God?" the child is pro-

ceeding sensibly by connecting it with his experience, as he knows what it is for something to be made. Anderson said the best approach to religion in education for children was to dispense with the notion of "sacredness" and treat religious writings as *literature*—coupled, for example, with the study of the legends of the Greeks, which "have always seemed to me to be much more interesting than the Christian stories—perhaps because they are connected with the life of a highly cultured people."

In general, Anderson opposed religious dogma because of its promotion of unintelligibility and because of its "servile ethic." Influenced in part by G. E. MOORE and G. Sorel, he developed an objective, nonprescriptive theory of ethics according to which positive ethical goodness is a quality of inquiring, artistic, and other productive/enterprising social activities. In terms of this he criticized the Christian attitudes of dependence, renunciation, and consolation. As he once put it, "As Sorel has pointed out, Christianity takes the standpoint of the individual recipient of benefits and has no sense of the organization involved in scientific, artistic and productive activity; it exalts 'humble virtue' at the expense of the achievements of culture which alone can be called good."

On the side of the content of Christian belief, Anderson followed philosophers such as David HUME and Immanuel KANT in demonstrating the logical failure of theistic arguments. But while recognizing that there exist no God or gods, he took ATHEISM to be only a particular application of his basic "ontological egalitarianism." Contrary to much of the metaphysics in the history of philosophy, he held that there are no *necessary*, *ultimate*, or *all-explaining* ontological beings or realities. This position, which he defended by trenchant criticisms of philosophical monism, dualism, and atomism, is summed up by saying that there is neither the One nor the Two nor the Many, but only the None—that is to say, no ultimate realities.

A. J. BAKER

ANNEKE, MATHILDE FRANZISKA GEISLER (1817–1884), German freethought editor and feminist. Born on April 3, 1817, Mathilde Franziska was the first of twelve children born to a prosperous family in Westphalia. Mathilde was raised a devout Roman Catholic. At nineteen, she married a French wine merchant. After a battle over her daughter, Fanny, her marriage was annulled, and Mathilde turned more fervently to her faith. In 1847 she married Prussian artillery officer Fritz Anneke. She published a censored revolutionary journal while he was imprisoned for revolutionary acts, meeting Karl MARX and Mikhail BAKUNIN. Mathilde became a radical freethinker.

After Fritz fought in the failed German revolutions of 1848 and 1849, the couple fled to the United States with other German "Forty-Eighters" (see GERMANY, UNBELIEF IN; FREIEN GEMEINDEN, DIE). Settling briefly in Milwaukee, Mathilde published *Deutsche Frauenzeitung*, a radical monthly freethought journal dedicated to women's complete emancipation. Although the German-language press jibed her feminism, she continued to publish the periodical for two and a half years after the couple moved to New Jersey. She also edited *Newarkerzeitung*, a German-language paper of local news.

Mathilde spoke at the first woman's rights convention she ever attended, with atheist Ernestine L. ROSE translating, during the infamous "mob convention" of 1853 when clergy disrupted proceedings.

After three of her six children died of smallpox in 1858 (fearful of inoculation, Mathilde had not had them vaccinated), she went abroad while her husband worked as a foreign correspondent. She remained in Switzerland with their surviving children when Fritz returned to America to fight in the Civil War. In 1865 Mathilde returned to Milwaukee without her husband. An activist, she worked for temperance and anticlericalism, and opposed nativist propaganda. She cofounded Wisconsin's major suffrage group in 1869. She also opened the Milwaukee *Tochter Institut*, a highly regarded German-language girls' school. The tireless worker also lectured, wrote, and sold insurance on the side to supplement family income.

Anneke addressed the 1869 national Equal Rights Association convention in New York, where she called scientific knowledge "that fountain of all peacefully progressing amelioration in human history." She added: "There does not exist a man-made doctrine, fabricated expressly for us, and which we must learn by heart, that shall henceforth be our law. Nor shall the authority of old traditions be a standard for us—be this authority called Veda, Talmud, Koran, or Bible. No. Reason, which we recognize as our highest and only law-giver, commands us to be free."

Mathilde Anneke died on November 25, 1884.

ANNIE LAURIE GAYLOR

ANNET, PETER (1693–1769). British deist. Peter Annet was at one time a schoolteacher but later moved to London, where he joined the Robin Hood Society, a radical debating group, and wrote a number of freethinking polemics. His exact position on the theological spectrum is difficult to assess, as he published many of his essays anonymously; also, some essays occasionally attributed to him have more tinges of ATHEISM than of DEISM. His first publication was *Judging for Ourselves: Or, Free-Thinking the Great Duty of Religion* (1739), in which he articulated criticisms of Christianity based on the inconsistencies in biblical texts. Unlike Charles Blount, who raised questions about New Testament canonicity, Annet focused his skeptical and historical assessments on established texts. In 1744, stimulated by such works as Henry Dodwell's *Christianity Not Founded on Argument* (1742) and works by John Leland and George Benson, Annet published his *Deism Fairly Stated* (1744). Here he asserted that "Deism, properly so called, whatever ill usage it may have met with, is no other than the Religion essential to Man, the true, original Religion of Reason and Nature; such as was believed and practised by SOCRATES, and others of old, who were as great Ornaments, and did as much Honour to Human Nature, as any Christians ever did. . . ." This statement of what constitutes deism goes further than any claim made by previous deists such as Blount, Anthony COLLINS, Matthew TINDAL, and John TOLAND. Among conventional theological principles that Annet rejected were free will (his orientation here was fairly deterministic; see DETERMINISM), revelation, the Trinity, and resurrrection; on the question of evil (see EVIL, PROBLEM OF), he more or less restated the argument of EPICURUS.

In 1750 (the publication date is sometimes given as 1768, but this is unlikely), Annet published *A Collection of the Tracts of a Certain Free Enquirer, Noted by His Sufferings for His Opinions*. His posthumous reputation rests on this volume, which gives an accurate summation of his ideas. Annet was a careful and consistent thinker, but the aggressiveness of his style, amounting often to sarcasm, often diminished the shrewdness of his arguments. All the tracts in this volume are on theological topics, except for one titled *Social Bliss Considered*, in which Annet cast doubt upon marriage without a prospect of divorce.

Between October 7 and December 12, 1761, Annet was the editor and publisher of a periodical called *Free Enquirer*. Here his skepticism about the historical accuracy of the Old Testament led to a prosecution for blasphemous libel (see BLASPHEMY), which his earlier publications also seemed to invite. He was imprisoned for a month at the age of sixty-eight, and was forced to stand twice in the pillory. He died on January 18, 1769.

JOHN VALDIMIR PRICE

ANTHROPIC PRINCIPLE, THE. The Anthropic Coincidences. In 1919 mathematician and physicist Hermann Weyl puzzled why the ratio of the electromagnetic force to the gravitational force between two electrons is such a huge number, $N_1 = 10^{39}$. Weyl wondered why this should be the case, expressing his intuition (and nothing more than that) that "pure" numbers like π—that is, numbers that do not depend any system of units—when occurring in the description of physical properties, should most naturally occur within a few orders of magnitude of unity. Why 10^{39}? Why not 10^{57} or 10^{-123}? Some principle, Weyl thought, must select out 10^{39}.

In 1923 astronomer Arthur Eddington agreed: "It is difficult to account for the occurrence of a pure number (of order greatly different from unity) in the scheme of things; but this difficulty would be removed if we could connect it to the number of particles in the world—a number presumably decided by accident." He estimated that number, now called the Eddington number, to be $N = 10^{79}$. Well, N is not too far from the square of N_1.

In 1937 physicist Paul Dirac noticed that N_1 is the same order of magnitude as another pure number, N_2, which gives the ratio of a typical stellar lifetime to the time light requires to traverse the radius of a proton. That is, he found two seemingly unconnected large numbers to be of the same order of magnitude. If one number being large is unlikely, how much more unlikely is it that another will come along with about the same value?

In 1961 astrophysicist Robert Dicke pointed out that N_2 is necessarily large in order that the lifetime of typical stars can be sufficient to generate heavy chemical elements such as carbon. Furthermore, he showed that N_1 must be of the same order of N_2 in any universe with heavy elements. This became the first of what are called the anthropic coincidences, connections between physical constants that seem to be necessary for the existence of life in the universe.

While many examples of claimed anthropic coincidences can be found in the literature, here are the most significant:

1. The electromagnetic force is 39 orders of magnitude stronger than the gravitational force. If they were more comparable in strength, stars would have collapsed long before life had a chance to evolve.

2. The vacuum energy density of the universe is at least 120 orders of magnitude lower than some theoretical estimates. If at any time it were as large as these calculations suggest, the universe would have quickly blown apart.
3. The electron's mass is less than the difference in the masses of the neutron and proton. Thus, a free neutron can decay into a proton, electron, and antineutrino. If this were not the case, the neutron would be stable, in which case most of the protons and electrons in the early universe would have combined to form neutrons, leaving little hydrogen to act as the main component and fuel of stars.
4. The neutron is heavier than the proton, but not so much heavier that neutrons cannot be bound in nuclei, where conservation of energy prevents the neutrons from decaying. Without neutrons we would not have the heavier elements needed for building complex systems such as life.
5. The carbon nucleus has an excited energy level at around 7.65 million electron-volts (MeV). Without this state, insufficient carbon would be manufactured in stars to form the basis for life. Using anthropic arguments, astronomer Fred Hoyle was able to predict this energy level before it was confirmed experimentally.

The Three Anthropic Principles. In 1974 astronomer Brandon Carter introduced the notion of the anthropic principle, which hypothesized that the anthropic coincidences are not the result of chance but are somehow built into the structure of the universe. He proposed two versions. His weak anthropic principle (WAP) states: "We must be prepared to take into account the fact that our location in the universe is necessarily privileged to the extent of being compatible with our existence as observers." Carter's strong anthropic principle (SAP) says: "The Universe (and hence the fundamental parameters on which it depends) must be such as to admit the creation of observers within it at some stage."

Other authors have presented their own versions of anthropic principles, more than thirty being available in the literature. I will mention only three more versions—those proposed by mathematician John Barrow and physicist Frank Tipler in their tome on the subject. The first two are rephrases of Carter's wording. The Barrow and Tipler WAP reads: "The observed values of all physical and cosmological quantities are not equally probable but take on values restricted by the requirement that there exist sites where carbon-based life can evolve and by the requirement that the Universe be old enough for it to have already done so." Note that Barrow and Tipler require the existence of "carbon-based life," while Carter simply refers to the existence of "observers." This is better phasing, since many of the coincidences have to do with carbon, directly or indirectly.

Barrow and Tipler's SAP reads: "The Universe must have those properties which allow life to develop within it at some stage in its history." Note that all three authors say that the universe "must" have the properties that allow for the creation of life, or at least observers. Thus, the SAP seems to imply some intent or purpose within the universe.

Barrow and Tipler round out their trio of anthropic principles with what they term the final anthropic principle (FAP): "Intelligent information processing must come into evidence in the Universe, and, once it comes into existence, it will never die out."

Note that the term *anthropic principle* is a misnomer, as is *anthropic coincidence*. While singling out our kind of carbon-based life, none of the coincidences require *human* life or demand that carbon-based life develop intelligence.

Implications. The WAP is considered by most physicists and cosmologists to be a simple tautology. Of course the constants of nature are suitable for our form of life. If they were not, we would not be here to talk about it.

Still, the anthropic coincidences strike most people as puzzling; what might they imply about the nature of the universe? Barrow and Tipler suggest three different possible implications of the SAP:

(A) There exists one possible universe "designed" with the goal of generating and sustaining "observers."

(B) Observers are necessary to bring the Universe into being.

(C) An ensemble of other different universes is necessary for the existence of our universe.

Authors with religious agendas have interpreted (A) as evidence for a creator God, in particular, the God they happen to worship (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). They ask: How can the universe possibly have obtained the unique set of physical constants it displays, so exquisitely fine-tuned for life as they are, except by purposeful design—design with life and perhaps humanity in mind (see INTELLIGENT DESIGN THEORY)?

However, nothing in the above discussion requires that this God be the one of any particular faith. Indeed, "design" might be interpreted as a purely natural process, perhaps an evolutionary one akin to the design inherent in Darwinian natural selection (see DARWINISM) or just some structure built into the universe that science has not yet explained.

Possibility (B) arises from a mystical misinterpretation of quantum mechanics. Though it has formed the basis of a large popular literature in recent years, few physicists take it very seriously.

Possibility (C) presents the notion that multiple universes exist and so we happen to just live in a universe that is suitable for the evolution of our kind of life. We will consider this possibility below.

Fine-Tuning in the Eye of the Beholder. The strength of the electromagnetic force is determined by the value of the unit electric charge—the magnitude of the charge of an electron—designated by e. The claim is that e is a constant that has been fine-tuned far from its natural value in order that stars will live long enough for life to evolve (coincidence 1, above).

However, e is not a constant. We now know from the highly successful standard model of particles and forces that e and the strengths of the other elementary forces vary with energy, and changed very rapidly in the first moments of the Big Bang. According to current understanding, in the very high-energy environment at the start of the Big Bang, the four known forces were unified as one force, just as Weyl anticipated should happen "naturally." That is, e began with its natural value. Then, as the universe cooled, the forces separated by a process called spontaneous symmetry breaking into the four basic forces (electromagnetic, gravitational, strong nuclear, and weak nuclear) that we experience at much lower energies today, with e and the other force strengths having evolved to their current stable values. Stellar formation, and thus life, had to simply wait for the forces to separate sufficiently. Actually the wait was a just tiny fraction of a second.

Only four parameters are needed to specify the broad features of the universe as it exists today: the masses of the electron and proton and the current strengths of the electromagnetic and strong interactions. I have studied how the minimum lifetime of a typical star depends on the first three of these parameters. Varying them by ten orders of magnitude around their present values, I find that more than half the stars will have lifetimes exceeding a billion years.

Large stars need to live tens of millions of years or more to allow for the fabrication of heavy elements. Smaller stars, such as our sun, also need about a billion years to allow life to develop within their solar systems of planets. Earth did not even form until nine billion years after the Big Bang. The requirement of long-lived stars is easily met for a wide range of possible parameters. The universe is certainly not fine-tuned for this characteristic.

One of the many major flaws with most studies of the anthropic coincidences is that the investigators vary a single parameter while assuming all the others remain fixed. They further compound this mistake by proceeding to calculate meaningless probabilities based on the grossly erroneous assumption that all the parameters are independent. In my study I took care to allow several parameters to vary at the same time.

In a very impressive paper, physicist Anthony Aguire has independently examined the universes that result when six cosmological parameters are simultaneously varied by orders of magnitude and found he could construct cosmologies in which "stars, planets, and intelligent life can plausibly arise."

The standard model contains about twenty parameters that are not determined by theory but which must currently be inferred from experiment. However, only four are needed to specify most properties of matter. These are the masses of the electron and the two quarks ("up" and "down") that constitute protons and neutrons, and a universal strength parameter from which the value e and the other force strengths are determined. Ultimately, it is hoped that all the basic parameters will be determined by theories that unify gravity with the standard model, for example, string theory. We must wait to see if the calculated masses of the electron and neutron come out to satisfy coincidences 3 and 4, above. Another possibility, which we will consider below, is that these parameters are random.

Many of the examples of anthropic coincidences found in theological literature result from simple misunderstanding of physics. For example, any reference to the fine-tuning of constants like the speed of light (c), Planck's constant (h), or Newton's gravitational constant (G) are irrelevant, since these are all arbitrary constants whose values simply define the system of units being used.

Also, some of the "remarkable" precision people talk about is highly misleading, depending on the arbitrary choice of units. For example, theologian John Jefferson Davis asserts, "If the mass of neutrinos were 5×10^{-34} instead of 5×10^{-35} kg, because of their great abundance in the universe, the additional gravitational mass would result in a contracting rather than expanding universe." This sounds like fine-tuning by one part in 10^{35}. However, as philosopher Neil Manson points out, this is like saying that "if he had been one part in 10^{16} of a light-year shorter (that is, one meter shorter), Michael Jordan would not have been the world's greatest basketball player."

Incidentally, Davis's estimate of the neutrino mass is not accurate. In fact, the individual masses are not known, with experiments so far measuring only mass differences. Furthermore, if the mass of neutrinos were ten times greater, there likely would be ten times fewer of them in the cosmos and the gravitational effect would be the same. So this fine-tuning claim collapses on several fronts.

Let us next consider coincidence 5, which asserts fine-tuning is needed to produce carbon. Nobel laureate physicist Steven Weinberg has shown that the production of carbon in stars is not strongy dependent on the 7.65 MeV nuclear energy level predicted by Hoyle. Rather it hinges on the radioactive state of a carbon nucleus formed out of three beryllium nuclei. This misses being too high for carbon production by 20 percent, which, as he says, "is not such a close call after all."

In short, much of the so-called fine-tuning of the parameters of microphysics is in the eye of the beholder, a beholder not always sufficiently versed in physics who

plays with the numbers until they seem to support a prior belief that was based on something other than objective scientific analysis.

The Cosmological Constant Problem. Although we normally think of the vacuum as empty of matter and energy, gravitational energy can be stored in the curvature of empty space. Futhermore, quantum mechanics implies that a vacuum will contain a minimum zero-point energy.

Weinberg was perhaps the first to highlight the vacuum energy problem (coincidence 2). He referred to it as the cosmological constant problem, since any vacuum energy density is equivalent to the parameter in Einstein's theory of general relativity called the cosmological constant that relates to the curvature of empty space.

Calculations gave a value for the vacuum energy density that is some 120 orders of magnitude greater than the maximum value possible from observations. Since this density is constant, it would seem to have been fine-tuned with this precision from the early universe to ensure that its value today would allow for the existence of life.

Until recently, it was thought that the cosmological constant was probably exactly zero, in which case there was no need for fine-tuning. However, in 1998, two independent research groups studying distant supernovae were astonished to discover that the current expansion of the universe is in fact accelerating. More recent observations have confirmed this result. The universe is falling up! The source of this cosmic acceleration is some still-unidentified dark energy, which constitutes 70 percent of the mass of the universe. One possible explanation is gravitational repulsion by means of the cosmological constant, that is, by way of the vacuum energy field that is allowed by general relativity.

If that is the case, then the cosmological constant problem resurfaces. In the meantime, we now can argue plausibly that the original calculation was incomplete and a proper calculation will give zero for the vacuum energy density. Until these newer estimates are shown to be wrong, we cannot conclude that the vacuum is fine-tuned for life and have no particularly strong need to invoke a designer deity.

But what, then, is responsible for cosmic acceleration? What is the nature of the dark energy? A cosmological constant is not the only possible source of gravitational repulsion. According to general relativity, any matter field will be repulsive if its pressure is sufficiently negative. Theorists have proposed that the dark energy may be a matter field, called quintessence, which requires no fine-tuning.

Is Our Form of Life the Only One Possible? Consider the fact that we live on Earth, rather than Mercury, Venus, Mars, or some other planet in the known solar system. Mercury and Venus are too hot and Mars is too cold to support life of our kind. Mercury has no atmosphere, while the atmosphere of Venus is too thick for the sun's rays to penetrate to the surface and the atmosphere of Mars is too thin to provide sufficient oxygen and water.

The temperature range and other properties of Earth are just right for life. For example, Earth's atmosphere is transparent to the same spectrum of light to which our eyes are sensitive. Anthropic reasoning would have it that the atmosphere was fine-tuned so that humans and other animals could see at a distance. The transparency also happens to match the spectral regions within which the electromagnetic radiation from the sun is maximal. Again, anthropic reasoning would attribute this to design with humans in mind.

But, rather obviously, life evolved on Earth *because* conditions here were right. The type of life that evolved was suitable for those conditions.

With 100 billion stars in 100 billion galaxies in the visible universe, and countless others, according to current cosmological theory, likely to lie beyond our horizon, the chances of some form of life developing on some planets seems very good. Indeed, many of the chemical ingredients of life such as complex molecules have been observed in outer space. Of course, we will not know for sure until we find such life.

Still, we expect any life found in our universe to be carbon based, or at least based on heavy element chemistry. The fine-tuning argument implies that this is the only form of life that is possible, but that is a huge, unwarranted assumption. Even if all the forms of life in our universe turn out to be of this basic structure, it does not follow that life is impossible under any other arrangement of physical laws and constants. This fact alone is fatal to the fine-tuning argument.

Carbon would seem to be the chemical element best suited to act as the building block for the type of complex molecular systems that develop lifelike qualities. Even today, new materials assembled from carbon atoms exhibit remarkable, unexpected properties, from superconductivity to ferromagnetism. However, we have no reason to assume that only carbon-based life is possible.

Given the known laws of physics and chemistry, we can imagine life based on silicon or other elements chemically similar to carbon. While carbon may be optimum for the parameters of our universe, silicon might be better if the parameters were slightly different. However, whatever elements are used, they still require cooking in stars and thus a universe old enough for stellar evolution.

We can only speculate what form life might take on another planet, with different conditions. It would be wonderful to have more examples of life, but we do not. And any speculation about what form life might take in a universe with a different electron mass, electromagnetic interaction strength, or different laws of physics is even more problematical. We simply do not have the knowledge to say whether life of *some* sort would not occur under different circumstances.

Multiple Universes. We have seen that cosmological parameters, such as the cosmological constant, need not have been fine-tuned for life. We also have a plausible scenario in which the strengths of the four forces evolved to their current values, and recognize that long-lived stars can be expected over a large range of these and other physical parameters. The hope is that a future theory that unifies gravity and microphysics will enable the calculation of the few parameters that are needed to define the fundamental structure of matter. However, even if this hope is not realized, current theories already suggest another possible answer to the anthropic coincidences.

For example, our universe may be just one of a huge number of other universes within some super universe called the multiverse. Fundamental parameters may be randomly distributed among universes, and we simply live in the one where the parameters happen to be suitable for the evolution of our form of life.

Theists have scoffed at the idea of multiple universes, arguing that we have no evidence for the existence of any but our own. But we have no evidence for their God, either. At least in the case of multiple universes we have physical theories, based firmly on empirical data within our own universe, pointing to their existence. The highly successful cosmological inflation model implies that the spontaneous event that created our universe would have been repeated many times. While this may still be classified as speculation, it is speculation based on good science and observational data. The speculation that a creator God exists is based on no science and no data.

Several commentators have argued that a multiverse cosmology violates Occam's razor. This is wrong. The entities that Occam's law of parsimony forbids us from "multiplying beyond necessity" are theoretical hypotheses, not universes. Although the atomic theory of matter multiplied the number of bodies we must consider in solving a thermodynamic problem by 10^{24} or so per gram, it did not violate Occam's razor. Instead, it provided for a simpler, more powerful, more economic exposition of the rules that were obeyed by thermodynamic systems.

The existence of many universes is in fact consistent with all we know about physics and cosmology. No new hypotheses are needed to introduce them. It takes an added hypothesis to rule them out—a superlaw of nature that says only one universe can exist. That would be an uneconomical hypothesis. Putting it another way, we have no basis for assuming that only a single universe exists. The theist argument requires two hypotheses that are unwarranted by data or theory: (1) only one universe exists and (2) God exists.

A Life Principle? Despite the apparent uncongeniality of the universe to life, life is present and some people still insist that this is remarkable. Physicist Paul Davies suggests a life principle is "written into the laws of physics" or "built into the nature of the universe."

Of course, nowhere in current physics, chemistry, or biology do we see any sign of a fundamental life principle, some *élan vital* that distinguishes life from nonlife. Davies speculates: "[A] felicitous mix of law and chance might be generalised to cosmology, producing directional evolution from simple states, through complex, to life and mind." Davies shares this notion with Nobel laureate biochemist Christian de Duve and biologist Stuart Kauffman. These authors all seem to view the life principle as some previously unrecognized, holistic, teleological law of nature. Nancey Murphy and other theologians who admit that the traditional notion of a separate soul and body is no longer viable given the evidence from neuroscience (see COGNITIVE SCIENCE AND UNBELIEF), have termed this notion "nonreductive physicalism." They think they can find a place for God and the soul therein.

However, computer simulations indicate that complexity evolves from simplicity by familiar, purely reductive physical processes without the aid of any overarching holistic guiding principle. The life principle, if it exists, may be one of the type of so-called emergent principles found in chaos and complexity theory that naturally arise from the nonlinear, dissipative, but still purely local interactions of material particles. These cannot be called new laws of physics since they follow from already existing laws, if not by direct, mathematical proof, then by computer simulation.

A Tiny Pocket of Complexity. Perhaps any random universe, regardless of its properties, will naturally develop at least some tiny pockets of complexity within a vast sea of randomness, which is just what we see in our universe. Complexity is not so ubiquitous in our universe as most people seem to think. The photons in the Cosmic Microwave Background, a billion times more common than hydrogen atoms, are random to one part in a hundred thousand. The visible matter we see around us and in the sky, which impresses us so much by its complexity, constitutes one-half of 1 percent of the mass of the universe. Perhaps we do not need either a designer or multiple universes to explain such small deviation from chance behavior.

I find it rather amusing that theists make two contradictory arguments for life requiring a creator. Sometimes you hear these from the same people. In the fine-tuning argument, the universe is so congenial to life that the universe must have been created. But if it is so congenial, then we should expect life to evolve by natural processes. In the second argument, which one hears from creationists and antievolutionists, the universe is so uncongenial to life that life must have been created. In that case it is too unlikely for life to have evolved by natural processes and so must have been produced by an intelligent designer. But then life could very easily have been an improbable accident.

The universe looks just as it would be expected to look if it were not created by God. From this we can conclude, beyond a reasonable doubt, that such a God does not exist.

ANTHROPOMORPHISM AND RELIGION. Anthropomorphism commonly is defined as the attribution of human characteristics to nonhuman things and events. RELIGION, in contrast, has defied any common definition. Attempts to define religion range from those of adherents, who may, for example, refer to it as an engagement with something sacred or transcendent, to those of skeptics, who may see it as anthropomorphism. The view that all religions do, in fact, anthropomorphize is somewhat less controversial. It is based on a near consensus that religions universally postulate the existence of some important nonhuman, yet humanlike, being or beings. The significance of this, however, is widely debated.

The relationship of anthropomorphism and religion historically has been contested, especially in Judaism, Christianity, and Islam. From as early as the Greek writer Xenophanes, observers have noted that religions include representations of gods as humanlike beings. These often resemble the religion's adherents mentally, physically, or both. Xenophanes pointed out, for example, that Ethiopians represented their gods as black, while Thracians conceived theirs as having red hair; and the Bible presents a God with face, hands, jealousy, and other human features. Jewish, Christian, and Muslim theologians, however, have tried to minimize the importance of human features in these representations, maintaining that they are merely the attempts of a limited human mind to understand a being that is wholly other. Dissenting scholars reply that if human features are deleted from our conceptions of gods, almost nothing remains.

Theories of Religion. Understanding the relation of anthropomorphism and religion may help illuminate a perennial question: Why are religious thought and action so pervasive in human life? The question arises because something identifiable as religion, though highly variable, seems to exist in every human society, yet independent evidence supporting essential religious ideas is tenuous. The question persists, moreover, because despite centuries of scholarly inquiry into the basis of religious belief and behavior, no general consensus has emerged. Instead, theories of religion are divergent, without so much as an agreement on a definition of religion itself.

Most broadly, these theories may be divided into two camps: those of religious believers and those of unbelievers. The theories of believers may be further divided into two groups: those that aim to give a single account for all religions, and those that give one

account for some religion regarded as true, and another for all the rest.

Neither group offers a convincing general theory—that is, one that accounts for religion in general. Those theories that account for the "true" religion in one way (e.g., as the result of revelation) and for other religions in another way (e.g., as the result of ignorance) are, by definition, not general but special. On the other hand, theories that aim at a single account for all religion can achieve it only by great abstraction, because religious beliefs and practices are so diverse. Indeed the authors of such theories (e.g., Friedrich Schleiermacher, Rudolf Otto, and Mircea Eliade) often regard specific beliefs and practices as irrelevant and claim that what counts is a certain ineffable religious experience (see RELIGIOUS AND MYSTICAL EXPERIENCES).

This experience supposedly is universal. Because it is unique and autonomous, however, it cannot be corroborated or compared. The resulting accounts necessarily are vague and even incoherent. They are accessible only to those who have had the experience, and offer no way to know whether one's own experience is the same as that of another.

The theories of skeptics also are both divergent and problematic. The idea that religious beliefs are mistaken is almost their only consensus. These theories may be divided loosely into three groups: wishful thinking, social glue, and intellectualist. These three also may be combined in varying ways.

Wishful thinking theories describe religion as an attempt to assuage our anxieties and discontents by imagining a better world. In such a world, we are aided by superhuman beings and rewarded for good behavior (often in a future life), while our enemies are punished. Variants of the wishful thinking approach go back to Greek and Roman times and continue to the present, but the best-known advocate is the late nineteenth- and early twentieth-century writer Sigmund FREUD. Freud saw humans as enmeshed in existential difficulties and as desperately needing the reassurance that they supposedly find in religion.

While wishful thinking may perhaps be involved in religion, at least two facts suggest that it is insufficient as an explanation. First, most religions have beliefs with components that we probably would not choose: hells, purgatories, angry and jealous gods, and the like. Second, even if all features of religious belief were sanguine, the theories still would have to say why anyone would believe them. In other areas of life, we do not simply believe whatever would feel good. Hungry people, for example, do not content themselves with imagining that they have just eaten.

Social glue theories hold that the function of religion is to satisfy a society's need for cohesion and solidarity. This approach, too, may be traced back to antiquity, but its most influential exponent is the French sociologist Emile Durkheim, roughly a contemporary of Freud. According to Durkheim, religion aids social cohesion by providing a symbolic image of society, such as a god or a flag, which represents its essential elements, especially its ethics. This image underscores society's value for its members and the primacy of its demands on them. The symbolic image may or may not take the form of a deity, since its defining characteristic is only that a society's members regard it as sacred.

Social glue theories, like wishful thinking theories, doubtless make valuable points. Again, however, they have crucial limitations. First, they provide no good explanation of what motivates people to think and act religiously. Second, the religions of some societies, such as those of hunter-gatherers, are not clearly linked to their ethics. Third, although religion sometimes unites groups, it sometimes divides them as well.

The third or intellectualist (now often called cognitivist) group of theories presents religion as an attempt to understand the world as a whole and to act accordingly. Its lineage extends back at least to Benedict de SPINOZA in the seventeenth century and continues with David HUME in the eighteenth and E. B. Tylor in the nineteenth. At present it is perhaps the leading approach among skeptics.

Most members of this group hold that the common characteristic of religion is the view that the world is shaped in important ways by humanlike, though nonhuman, beings. For example, all manner of phenomena—from windstorms to butterfly wings to the starry firmament—may be seen as the actions or products of humanlike agents, usually acting behind the scenes. Writers in this group note that even Buddhism, often cited as a "godless religion," in fact has a pantheon of deities, often including the Buddha himself. Although there are, to be sure, Buddhist philosophies and psychologies in which gods are absent, these are no more diagnostic of Buddhism in general than are demythologized Christianity or Judaism of those religions.

The humanlike agents postulated by believers may or may not be described in detail. They may be as fully fleshed out as Krishna or Christ, or as allusive as "intelligent design" (see INTELLIGENT DESIGN THEORY) or Tillich's "ground of being." In either case, the intellectualists hold, religions anthropomorphize natural phenomena, though varying in the human features emphasized (usually mental features but often physical ones as well) and in the level of detail.

That religion anthropomorphizes is not really in question. Even theologians admit, if reluctantly, that it inevitably does so. The question is, rather, why it does and what this implies. For the theologians, as noted, anthropomorphism merely marks the limits of the human mind in trying to grasp a transcendent Other. For the skeptical theorists as well, it marks human limits, but these are limits in understanding the natural world, not a divinity. Encountering our limits, we invoke humanlike models for nonhuman phenomena.

Theories of religion as anthropomorphism have not been convincing, however, because they have not successfully explained anthropomorphism itself. This may be because they have looked mainly at anthropomorphism only in religion, not in general. This is a major oversight, because anthropomorphism itself is highly general.

Explanations of anthropomorphism have been of two sorts: wishful thinking and familiarity. Although each is useful, neither is sufficient. Wishful thinking was mentioned above as a theory of religion. As a theory of anthropomorphism, it holds similarly that a nonhuman world is frightening and lonely, and that we therefore populate it with supportive quasi-human beings. The problem with this explanation is that many imagined humanlike beings, like many humans, are not supportive but threatening—for example, sasquatches, goblins, and Frankenstein's monster. Likewise, when we find ourselves in a lonely place after dusk and mistake a tree stump or a shadow for a threatening figure, we are anthropomorphizing but not reassuring ourselves.

A second explanation of anthropomorphism (offered by both Spinoza and Hume) is that we simply wish to understand the world, which is vast and mysterious, and that to do so we employ the most familiar available model. That model is ourselves. The problem with this explanation is that we anthropomorphize not only unfamiliar things and events but also ones that are as familiar to us as we ourselves: dogs and cats, cars and computers. Although we may feel that we are even more familiar with ourselves than with such other things, writers including Shakespeare and Freud note that we know ourselves but slenderly. Our self-knowledge then is not necessarily more direct or reliable than our knowledge of not-self. Since we already have models for cats, cars, and computers that are as adequate intellectually as our models of ourselves, something else must explain why we insert humanlike features.

Anthropomorphism and Animism: A New Account. A more adequate explanation of anthropomorphism begins with the realization that religion is only a small part of its manifestations. Together with a closely related phenomenon, animism—here defined as attributing characteristics of life to biologically inanimate things and events—anthropomorphism appears throughout human thought and action: in daily life, in the arts, and even in the sciences.

In daily life, for example, we find faces in clouds and in wood grain, and do so without thinking. When we hear a door slam somewhere in the house, we wonder who is there, even though we expect no one and know that it is windy outside. When we see a windblown leaf or dust ball scurry erratically across a surface, we look twice, thinking it is an insect or spider. Graphic art and literature also regularly personify and animate both natural phenomena and human artifacts. Shakespeare in *As You Like It*, for instance, finds "tongues in trees"; Homer's spears thirst for blood. Even the sciences, which abjure anthropomorphism, inadvertently employ humanlike models. Charles DARWIN, for example, described Nature as diligently improving her progeny.

Moreover, anthropomorphism and animism both are durable, worldwide, and diverse. Paleolithic cave paintings display them, and today people cross-culturally continue to see human and animal shapes everywhere, for example, in such landforms as mountains and stalactites. We think we see not only physically human forms but also, and more importantly, mental features such as intention. Stuck drawers appear obstinately to resist us. Developmental psychologists such as Jean Piaget and Deborah Kelemen have shown that even young children assume that the world manifests design and purpose: clouds are for raining, and lions are to put in zoos. Nonetheless, we fail to appreciate the pervasiveness of anthropomorphism and animism, because (like most mental processes) they remain primarily unconscious.

If wishful thinking and familiarity do not account for the omnipresence of anthropomorphism and animism, what does? The apparent answer lies in the uncertainty of our knowledge of the world, in the importance to us of humans and other animals, and in our strategy for dealing with this uncertainty and this importance.

As Spinoza, Hume, and other philosophers have noted, and as contemporary cognitive psychology affirms, uncertainty in perception and cognition is pervasive and chronic. Perception is uncertain because any given sensation, such as a tickle on our skin, a booming noise, or a dark shape in an alley, has more than one possible cause. The tickle may be a loose thread or a spider, the noise may be a firecracker or a gunshot, and the shape may be a sack of garbage or a lurking figure. Thus, phenomena do not declare their own meanings but must be construed. The world we hear, see, and feel is not transparent but must be interpreted. Because we typically do not have enough timely information for certainty, our interpretations are bets.

The interpretive bets we make are neither random nor based primarily on probability. Rather, we bet primarily on significance—that is, on information important to us, even if that information is improbable. Thus we bet on the most significant possibilities we know that might fit the stimulus: the spider not the thread, the gunshot not the firecracker, and the figure not the sack. If these bets are right, we gain much. Most important, we are prepared for appropriate action. If the bets are mistaken, we have lost little.

Among things and events we might bet on, the most important to us usually are the most highly organized, which is to say, living organisms. These constitute hot spots of significance: of energy, of motion, of things that we might eat or that might eat us. Correctly interpreted, organisms (and traces of them) also deliver big packages of information, not only about themselves but also about their environments. Snakes may mean painful bites,

birds screaming in a tree may mean a snake, and the disappearance of birds may mean environmental toxins.

Although complex animals such as snakes and birds are important to us, the most highly organized animals, our fellow humans, are more important still. This is not a result of our egotism but of our practicality, since humans are the most potent creatures we know. Thus they may be our best friends, our worst enemies, or something in between. Hence, although we are sensitive to the presence of any animals, we are with good reason especially sensitive to the presence of humans.

However, our sensitivity to animals and humans does not give us certainty about their presence or absence. The inherent ambiguity of perception is exacerbated by natural deception in the case of nonhuman animals and by deliberate deception in the case of humans. By virtue of their highly evolved camouflage, almost all wild animals in their natural habitats are difficult if not impossible to see until they move. With a few exceptions, such as animals in mating plumage, they do not stand out like a black-and-white cow in a green pasture, but merge imperceptibly with their environments. Humans may choose similarly to remain unseen and may use even more elaborate deceptions than those of animals.

As a result of such deception, our sensitivities to the presence of any and all agents are especially finely honed and on a hair trigger. Special sensitivities of several kinds, apparently innate, reveal our evolved preoccupation with detecting animals, including humans. Visual sensitivities alone include sensitivities to motion (especially motion that appears self-initiated or goal directed), symmetry (especially bilateral symmetry), eyespots (black disks resembling eye pupils), faces, and spectrally pure color (such as that of coral snakes). Any of these catches our attention. We also have apparently innate sensitivities to evidence of characteristically human capacities and activities: to seeming design and purpose, social intention, and symbolic communication. Thus we look for meaning everywhere and see comets as portents, evolution as design, and plagues, including AIDS, as punishments.

Since all these sensitivities are on a hair trigger, they are especially susceptible to mistakes. Doors slammed by the wind are not persons, yet we persistently hear them as such. Nor are plagues punishments, storms angry, or the universe a result of design. Yet for thousands of years people have thought they were, and today many still find such thinking natural. In our perceptual situation, this kind of mistake is inevitable. Our perceptual and cognitive stances are not neutral, but rather biased toward discovering animals and particularly people. Correspondingly, we often mistakenly find them where they do not exist. Thus our world chronically appears to us more alive, more personal, and more purposeful than it is.

Although anthropomorphism and animism are by definition mistakes, the proclivity that gives rise to them—the proclivity to find agents wherever they exist—is not a mistake. Rather, it is an evolved strategy that copes with the natural environment, one in which most agents conceal themselves. The central principle of this strategy is "better safe than sorry." It is better that we mistake a stick for a snake than the other way around. Although nine of ten such identifications may be mistaken, the single correct one makes betting high a good strategy.

Religion as Systematized Anthropomorphism. The strategy of betting high has, as noted, been built into our perceptual sensitivities, and we therefore interpret the world as alive and humanlike. Not all such interpretations, of course, constitute religion. Some mistaken interpretations are quickly discovered and tacitly dismissed as anthropomorphism or animism: I thought that was an animal on the road but now I see it's a piece of a tire. Others linger but do not become part of a larger system: artifacts in advertisements, for example, may be humanized so subtly that we are not consciously aware of it, but their significance ends with consumer behavior. Still others influence larger-scale expectations and behavior, and may be quasi-religious. Our expectation that the world show design and purpose, for example, has made plausible Adam Smith's notion that market systems operate for the general well-being, as an "invisible hand." This notion, and the expectation that makes it seem natural, encourage laissez-faire policy.

What we call religion, however, is a still more comprehensive and more systematic form of anthropomorphism. In a religious worldview, most, if not all, events may be attributed to the consistent, elaborated will or workings of humanlike beings operating offstage. Indeed, a religious view may rule out the very notion of accident.

A religious worldview may be put to varied uses. People may be reassured by having some encompassing account of the world, even if this is a harsh or gloomy one. Rulers of stratified societies, such as chiefdoms and states, may use religion to bolster their regimes, as by asserting that gods support them or that their subjects will be rewarded or punished in a later life. Although the uses to which religion can be put may explain why religions are actively promulgated, however, they do not explain what gives rise to religion and makes it plausible. What does so is that human beings are spring-loaded to see human characteristics, both physical and mental, in the world at large.

Conclusion. Religion, then, may be described as a system for interpreting and influencing the world, built on an anthropomorphic premise. So described, religion has borders with other sorts of thought and action that are not sharp but gradual. Continuous as it is with other thought and action, including common sense and science, religion is not sui generis but has the same topic (the world), the same aims (influence and interpretation), and the same methods (conjecture and criticism) as they. Although distinctions can usefully be made, they are distinctions of degree, not kind.

The relation of anthropomorphism and religion thus is both close and complex. Anthropomorphism is central to religion but not unique to it. All religion is anthropomorphic, but grades into other phenomena, such as philosophy and psychology, that typically are not. Religion has at its heart a misapprehension, but the impulse that gives rise to that misapprehension is no mistake. Rather, it is a necessary component of our orientation to the world.

STEWART ELLIOTT GUTHRIE

ANTHROPOSOPHY. An international religious sect following the teachings of Rudolf Steiner (1861–1925), also called Spiritual Science. Activities include Waldorf education, Anthroposophical medicine, pharmaceuticals, Camphill communities for the developmentally disabled, biodynamic agriculture, Eurythmy (a spiritual dance), art schools, psychotherapy, elder care, the Christian Community (a formal church), financial institutions, publishing, and politics (Steiner's "threefold social order"). The world headquarters of the Anthroposophical Society is the Goetheanum in Dornach, Switzerland.

History. Steiner followed the technical education track in his native Austria, and supported himself by private tutoring and lecturing at a workers' institute. He was engaged to edit GOETHE's scientific works for a new edition. In recognition of this work Steiner was given a doctorate, conferred in a special dispensation by a university professor.

In 1894 Steiner published his chef d'oevre in philosophy, *The Philosophy of Freedom* (also translated as *The Philosophy of Spiritual Activity*). It failed to establish Steiner in the academic world.

Steiner was appointed head of the German section of THEOSOPHY by Annie BESANT in 1902 after his lectures made a strong impression at a Theosophical congress. He had found his life's work. He was a charismatic leader, and the sect thrived. Around 1912 Charles Leadbeater at Theosophy's center in India convinced other Theosophical leaders that a boy he admired, Krishnamurti, was a reincarnation of Christ. Steiner had already integrated Christ into his cosmological system, and Krishnamurti had no place in it.

Steiner split with Theosophy (knowledge of God) to form his own group, which he called Anthroposophy (knowledge of man). Most of the German section defected with him, forming an instant cult. Later he claimed to have been teaching Anthroposophy all along, and Anthroposophical presses sometimes change "Theosophy" to "Anthroposophy" in editions of his earlier books. He taught a self-hypnotic meditation technique that engenders feelings of wisdom and superiority.

Worldview. Anthroposophy synthesizes a wide range of spiritual traditions, claiming to reveal comprehensive truths that are only present in fragments in other religions. At its foundation are the concepts of REINCARNATION, karma, and polytheism, which derive from Buddhism and Hinduism. Steiner was something of a fundamentalist Platonist, holding that the real world was all illusion and objects but reflections of eternal essences in the spiritual world. He also espoused Plato's political philosophy, and may well have imagined himself as a philosopher-king. He took the dual gods of light and dark from the ancient Persian religion Zoroastrianism, identifying the light god as Lucifer, and created his own trinity of Lucifer, Ahriman (the dark god), and a Gnostic and Manichean conception of Christ, usually referred to as "the Christ Spirit." Steiner, who claimed to be able to see the past and future written in the "akashic record," wrote *The Fifth Gospel* to explain what really happened in the life of Christ.

To this rich mix Steiner added European occult traditions: Cabbalism, numerology, white magic, alchemy, Rosicrucianism and Masonry, and spiced it with vegetarianism, astrology, herbalism, and homeopathy. Steiner claimed to make "exact scientific observations" in the spiritual world, so it is impossible to question the veracity of his authoritative pronouncements without questioning the foundations of Anthroposophy.

Racism. Steiner lectured extensively on evolution, a popular topic at the beginning of the twentieth century, but his theory was explicitly opposed to Charles DARWIN's. He taught that humans have always been

present, and that the nonhuman animals evolved out of humanity, separating out overspecialized qualities (the eagle's vision, the gazelle's speed) so that humanity could be perfectly balanced.

Evolution in Anthroposophy also involves personal development as souls reincarnate in successively higher races. Anthroposophy follows the Theosophical system, derived in turn from Hinduism, of cycles within cycles. Steiner taught that mankind should have advanced together from race to race, but the "adversary" gods Lucifer and Ahriman interfered, and so races that should have died out are still hanging around. Steiner changed the Theosophical terminology from "root races" to "cultural epochs," but made it clear that skin color was a definitive indicator of spiritual potential. Black skin belongs to survivors of the Lemurian root race, and yellow skin to Atlanteans who failed to progress. Native Americans are a remnant destined for extinction, and the survival of the Jews is "a mistake of history." The present time period belongs, unsurprisingly, to the white "Aryans." Anthroposophists find these doctrines embarrassing, but they construct elaborate evasions and denials rather than simply repudiating Steiner's words.

Anthroposophy and the Nazis. During and after World War I, Steiner was active politically. He proposed his "threefold social order" to the leaders of Europe, but could not find a receptive audience. He sent agents to influence the election in Upper Silesia, and at one point had a weekly newspaper in Stuttgart. The growing Nazi movement regarded Anthroposophy as a rival for the hearts and minds of the German people.

Steiner died in 1925, eight years before Hitler came to power. During the Nazi period, Anthroposophy and its works were controversial in the Nazi party. There was a clear majority against the Anthroposophical Society itself, since it was a political rival, and it was banned in 1935. Other Anthroposophical activities like biodynamic agriculture and the Waldorf schools collaborated, and were protected by supporters in the party. Jewish teachers left or were dismissed from Waldorf schools, and a German Waldorf school association was formed that claimed the schools were teaching National Socialist ideals. Waldorf schools were harassed by local officials, but many survived until Rudolf Hess, a strong supporter of Anthroposophy, flew to Scotland. After that it was open season on occultists and the last schools were closed. Biodynamic agriculture remained a successful collaboration.

Anthroposophy Today. Working in the world doesn't secularize Anthroposophy; rather Anthroposophy attempts to spiritualize the world. These worldly activities are usually referred to in Anthroposophical jargon as "initiatives," based on Steiner's "impulses." They are claimed as Anthroposophical activities when it is desired to glorify Anthroposophy, but denied and called independent free associations when scandals arise or outsiders question their connection to problematic Anthroposophical doctrines. Each activity will, of course, have its own local nonprofit corporation, but they are all carried out under Anthroposophical direction, ultimately taking guidance from departments in the Dornach headquarters (near Basel, Switzerland).

Waldorf Education. Waldorf schools, also called Steiner Schools and Free Schools, are named after the original school that Steiner founded in Stuttgart, Germany. The school was for the children of the workers at the Waldorf-Astoria cigarette factory, thus the name. The movement calls itself the largest nonsectarian school system in the world, but pervasive Anthroposophical doctrine vitiates its claim of being nonsectarian. Waldorf education is guided by Steiner's theory of child development, which is based on reincarnation. In this scheme, the physical body is born at birth, the "etheric body" at age seven, the "astral body" at age fourteen, and the "I," the immortal member, at age twenty-one. Teachers classify students according to the ancient "four temperaments." Teachers are trained in a two- or three-year Anthroposophical seminary program in which the first year, called the foundation year, consists entirely of the study of Anthroposophy.

Anthroposophical pseudoscience is easy to find in Waldorf schools. "Goethean science" is supposed to be based only on observation, without "dogmatic" theory. Because observations make no sense without a relationship to some hypothesis, students are subtly nudged in the direction of Steiner's explanations of the world. Typical departures from accepted science include the claim that Goethe refuted Newton's theory of color, Steiner's unique "threefold" systems in physiology, and the oft-repeated doctrine that "the heart is not a pump" (blood is said to move itself).

Anthroposophical Medicine. Medicine is one of the more visible activities of Anthroposophy in Europe. Physicians are required to have medical degrees before training in Anthroposophical medicine, but that training denies and contradicts evidence-based medicine. Steiner's method uses homeopathic remedies, but abjures the homeopathic method of testing a proposed therapeutic substance by observing the effects of the undiluted substance on a volunteer. The symptoms the subject experiences are supposed to indicate the diseases that the diluted substance will cure. This was too scientific for Steiner, who preferred to rely on the traditional herbalistic method of recognizing the application of a remedy from its appearance. For example, his remedy for cancer is mistletoe, because mistletoe grows radially rather than toward the sun as other plants do, and cancer grows radially. The Anthroposophical cancer remedy Iscador, prepared in a magical process from mistletoe, is in common use in Europe despite a lack of sufficient evidence for efficacy.

Camphill. Camphill communities are Anthroposophically inspired residential programs for developmentally disabled children and adults. Completely contained

enclaves, they are worthy of study as models of life in an Anthroposophical world. Since only cooperative inmates are retained, the atmosphere is artificially idyllic, and an ostensible "village" structure conceals strict authoritarianism.

DAN DUGAN

ANTICLERICALISM. Opposition to the power and pretensions of the Roman Catholic Church. In its narrower sense anticlericalism connotes opposition to reactionary political and social views favored by the Roman Catholic Church in countries where its influence was strong, in particular, Italy, France, Belgium, Spain, and the nations of Latin America. The classical period of anticlericalism extended from the 1850s to the 1910s, although it remains influential in all of these countries and regions to the present day.

Catholic doctrine claims that because Catholicism is the only true religion, it enjoys a unique right to exercise leadership in society. Boniface VIII outlined this attitude clearly in the 1302 encyclical message *Unam Sanctam*, in which he decreed: "We declare, affirm, and define as a truth necessary for salvation that every human being is subject to the Roman pontiff." For centuries to come, many who served the papacy felt justified in seeing their own political preferences as also being those of God, which in turn justified harsh measures against those who would dissent. Countries with large Catholic majorities have long been resigned to clerical interference in politics, education, and cultural affairs, whether directly or behind closed doors. And those who oppose such measures must, so this thinking goes, work from ignoble or even satanic motivations. There was a certain softening of this stance as a result of the Second Vatican Council (1962–65), but during the pontificate of John Paul II there was a partial return to the earlier hard-line position.

Anticlericalism is not the same as anti-Catholicism. To be anticlerical is to oppose the presumed right of Catholic churchmen to participate at a senior and unelected level in government decisions or in the cultural life of one's country. Anti-Catholicism, by contrast, is the opposition to all aspects of the Roman Catholic Church, not simply its interference in government. At its worst, anti-Catholicism includes the disparagement of Catholics as people. The old Protestant fears of "popery" and the fear of the "whore of Babylon" are informed more by theological than by political concerns. Protestant anti-Catholicism is concerned with what Protestants see as the Catholic betrayal of the original message of Christ, which they—the Protestants—are proclaiming in pure form once again. Laced with such theological fears were social fears of Catholics as being unreasonably prolific, uneducated, and a danger to the moral stability of the nation. For anti-Catholic Protestants, clerical mismanagement is only a symptom of popish falling away from the New Testament, but for anticlericals, it stands as a failing in its own right. Anticlericals might or might not be anti-Catholic in the broader sense. Indeed, many anticlericals have considered themselves to be sincere Catholics, and others have supported a variety of religious viewpoints. In particular, many anticlericals have been Masons. More recently, some of the most effective anticlerical groups have been Catholic reform organizations.

Anticlericalism, understood in the narrower sense, was provoked by the rise of Ultramontane Catholicism, a staunchly conservative form of Catholicism that grew out of the shock of the French Revolution and the subsequent temporal humiliation of the papacy. *Ultramontane* means "beyond the mountains," from the view of Europeans residing west of the Alps, a reference to Rome. In reaction to the Enlightenment values of reason, natural religion, confidence in the future, and in the possibility of building a better future (see ENLIGHTENMENT, THE, UNBELIEF WITHIN), Ultramontanism was bitterly antirationalist, even antimodern. It preferred a sentimental, unthinking piety centered around church, home, and hearth. Moreover, Ultramontanism spoke of Rome as the sole source of God's wisdom, indeed of any wisdom worth the title. Ultramontanism was also a response to Gallicanism, a powerful trend among national churches in the three centuries prior to the French Revolution to assert local control over their own affairs while conceding to Rome supremacy in the spiritual domain.

Whereas Gallicanism was confined to ecclesiastical elites, the confidence to criticize the actions of the church extended during the Enlightenment to the educated middle classes. And, and in many cases, these new critics were less prepared to offer lip service to the supremacy of the papacy over spiritual matters. The church made a series of blunders that seriously compromised its claim to exercise spiritual authority that could plausibly be seen as the will of God. In particular, the long record of persecution of progressive-minded people, from Galileo GALILEI to Denis DIDEROT, editor of the influential *Encyclopedie*, excited opposition from the general population. And the Calas case (1761–62), which VOLTAIRE turned into a cause célèbre of the underdog fighting against an unrepresentative tyranny, further undermined the moral authority of the church in the eyes of many people. But if the middle classes were critical of the church during the Enlightenment, the French Revolution extended that spirit of independence to the working people. French Catholicism suffered serious reverses in the years following the revolution. Its position was only partially restored by Napoleon, and then only as a political gambit rather than through any genuine sense of piety.

In the years after Napoleon's defeat, the Catholic Church in Europe forged close links with reactionary monarchies in an attempt to prevent the recurrence of such popular agitation as had occurred in France. While the church allied with reactionary regimes, progressive-minded people were more inclined to express their con-

fidence in the future in increasingly secular terms (see SECULARISM). Anticlerical views played a significant role in moving progressive opinion along by concentrating attention on the largest single obstacle to their dreams: the Roman Catholic Church.

The quintessential anticlerical politician was Leon Gambetta, an architect of contemporary French democracy. Born in modest circumstances, Gambetta was the child of a Frenchwoman and an Italian immigrant to France. Gambetta's talents moved him toward politics, and in 1869 he was elected as a deputy to the French parliament. After France's defeat by the Prussians in 1871 he became an important spokesman for the opposition to the hapless Emperor Napoleon III. Gambetta's courage during the war, and his dramatic escape from Paris in a balloon, inspired his countrymen at a dark time. So important did Gambetta become that although he only briefly held the position of premier, he is seen as one of the most important figures in the creation of the Third Republic. He was a very significant presence behind the 1875 Republican Constitution.

Gambetta led the struggle against clerical reaction between 1871 and 1879. His slogan was "Clericalism: there is the enemy!" He was a leading influence behind what are known as the Ferry Laws of 1881–82, which established free secular education, the right to civil marriage, and limited access to divorce. Each of these reforms was gained in the face of bitter clerical opposition. To this day there is hardly a town in France which does not have a Rue Gambetta.

The greatest victory of the French anticlericals was the formal separation of church and state in 1905. Prior to 1905, priests were habitually employed as teachers in state schools, where Catholicism was taught as the only religious option available. French Catholicism was also strongly anti-Semitic, reaching a fever pitch during the lengthy case involving the French soldier Alfred Dreyfus, a Jew who was falsely accused of treason in 1894 and not fully cleared of the trumped-up charges against him until 1906. The role played by anticlericals in these two series of events constitute anticlericalism's finest hour.

In Italy, anticlericalism took on a slightly different form, taking its definitive shape in opposing the tyranny in the Papal States. The pontificate of Pius IX in particular pitted the papacy, and thus Catholicism, against all the trends of the century: national unity, secular education, and the growth of science. Italian anticlericals saw the Catholic Church as standing squarely against progress. Nowhere was this more evident than in the Papal States. Until 1870 the pope ruled a large slice of central Italy, from the Gulf of Gaeta north of Naples to the delta of the Po on the Adriatic, several hundred miles to the north. The Papal States were chronically misruled, with standards of education, health, and civic amenities among the poorest in Europe. A call by European leaders at the Congress of Paris in 1856 for the pontiff to reform his lands was ignored.

The growing sense of a common Italian identity lay behind a drive to unite the peninsula into a united nation. But against this, the papacy claimed to hold legal tenure of its dominions going back to the Roman emperor Constantine, who was supposed to have donated that territory, as well as moral authority over all western Europe, to Pope Sylvester in perpetuity. In fact, the humanist scholar Lorenzo Valla had proved these documents, known collectively as the Donation of Constantine, were an eighth-century forgery. Valla had taught the popes to fear learning they could not control; later the near demise of the papacy at the hands of the revolutionary French in the years before Napoleon had taught them a lasting fear of radical politics. For a while Pius IX gave signs of being ready to embrace change, but he was so shocked by the revolts and unrest in 1848 that he quickly became more reactionary than his predecessors. His long pontificate was the principal breeding ground for contemporary anticlericalism, in Italy and abroad.

As a united Italy was being formed all around him, Pius IX retained his hold over the Papal States only because of the French, who stationed a large contingent of troops in Rome to quell the growing unrest. Across the rest of the country, the growing fervor of Italian nationalism grew in direct proportion to popular hostility toward the reactionary papacy. In 1850 the Kingdom of Piedmont passed a series of laws that drastically curtailed the power of the church. This legislation was a victory for anticlericals, who had little difficulty in portraying the papacy as the biggest obstacle to the future of Italy. Piedmont became the leading force in the drive for Italian unity, with the temporal power of the papacy as its target.

The true flag bearer for Italian anticlericalism, however, was Giuseppe Garibaldi. Even more of an adventurer than Gambetta, Garibaldi fought actively to unite Italy between 1859 and 1870. Garibaldi spoke of the papacy as the "sacred shop." It was the prospect of Garibaldi's soldiers, marching north from Sicily in 1860, that provoked a popular uprising in the Papal States. A motley papal defensive army was quickly defeated, leaving only Rome and its environs under papal control, and this due only to the continuing presence of French troops. All the other provinces voted overwhelmingly to throw off allegiance to the pope and to join the newly created Kingdom of Italy. Four years after this defeat, on December 8, 1864, Pius IX decreed the Syllabus of Errors, which roundly condemned virtually every tenet of modernity. For opponents of the Catholic Church, the Syllabus confirmed all their suspicions that the church was hopelessly reactionary (see DRAPER, JOHN WILLIAM).

Italy was finally able to march into Rome in 1870. The French withdrew in April, and in September the Italians marched in. Once again there was a plebiscite and the vote was overwhelmingly in favor of union with Italy. Rome became Italy's capital and Pius IX retreated

to the Vatican, claiming he was a prisoner. Pius then convened the first Vatican Council, which established the dogma of papal infallibility. This did nothing to reassure the anticlericals. After the heady years of the unification of the country, Italian anticlericalism lost its force as an agent for progressive change, while Italian politics declined into a corrupt merry-go-round of short-lived governments.

In Spain the situation was different yet again because of the uniquely pervasive role that the Catholic Church had forged for itself in the life of the country. For many people, to be Spanish meant to be Catholic, which in turn meant that opposition to the church could be equated with hatred of Spain. Much of this had grown out of the lengthy reconquest of the country from the Muslims and the subsequent campaigns to eradicate Judaism and Islam from national life. The strength and ubiquity of Spanish Catholicism provoked a proportionately intense anticlerical reaction to it. Successive nineteenth-century liberal governments enacted progressive legislation, only to see it repealed by the reactionary regimes that followed them. These changes were punctuated by recurrent violence against churches, seen by the poor as bastions of privilege, license, and corruption. Later in the century, Spanish anticlericalism became tinged with radical anarchism (see ANARCHISM AND UNBELIEF). Partly in reaction to the nationalist flavor Spanish Catholicism had assumed, the anarchists responded by renouncing nationalism in favor of a militant internationalism. This lent fire and commitment to the anticlerical cause, but the inability of anarchism to articulate a plausible alternative limited its appeal.

A significant figure in Spanish anticlericalism who did offer a positive alternative was the educator Francisco FERRER. After beginning his career as a revolutionary, Ferrer spent many years in exile in Paris, where he abandoned violent means and turned his energies to education. He returned to Spain and established a school with a strictly secular curriculum. Ferrer's policy of educating girls on equal terms with boys scandalized Catholic opinion. The schools were popular and eventually he had about forty of them around Catalonia.

When King Alfonso XIII was the target of an assassination attempt in 1906, the authorities took their opportunity. Ferrer was arrested and his schools closed down. The gambit failed, however, as Ferrer was acquitted of any involvement in the attack. During renewed unrest in 1909, there was serious rioting in what became known as the Tragic Week, and Ferrer's enemies saw an opportunity to saddle him with the blame. He was charged with fomenting the riots, and after a travesty of a trial Ferrer was shot on October 13, 1909. Ferrer's death brought about the downfall of the conservative Spanish government amid a storm of international criticism. Oblivious to this, Pope Pius X sent to the military prosecutor responsible for Ferrer's death an engraved, gold-handled sword as a reward.

The church's determination to retain its privileges and the intransigent opposition of the anticlericals, now joined by Communists, led the country into its disastrous civil war followed by the lengthy rule of Francisco Franco, which persisted until 1975. At the turn of the twenty-first century, however, the initiative rests once again with the anticlericals (see SPAIN, UNBELIEF IN). Emblematic of this was the Spanish government's 2005 decision to extend civil rights to homosexuals in the face of bitter church opposition.

In South and Central America, anticlericalism has had a long and varied career. Anticlericalism wedded in turn with liberalism, POSITIVISM, and MARXISM as respective vehicles by which the church could be challenged and its power curtailed. In the century after the South American countries secured their independence from Spain and Portugal, the church exhibited a distinct preference for autocratic regimes and looked to preserve its privileges. With some notable exceptions, the same had been true with respect to local independence struggles. Until shortly before Spain finally lost control of the continent, the papacy lent support to colonial powers. It was forced into an embarrassing reversal of this policy shortly afterward, in the face of a newly independent continent.

The precedent for Latin American anticlericalism was set by Simón Bolívar, the person who, more than anyone else, can be credited as the liberator of the continent from colonial rule. Bolívar, who had been in Paris at the time of the French Revolution, brought progressive and anticlerical ideas back to Latin America with him. Leaders keen to build their societies usually had to reckon with a powerful and deeply conservative Catholic Church that inevitably bred anticlerical attitudes. Powerful examples include Victorino Lastarria, who devoted his life to building up secular education, a free press, and an end to clerical privilege in Chile.

In Mexico the clerical reaction was so pronounced that the anticlericalism it provoked was among the most radical. The principal figure here was Benito Juárez. Shortly after becoming president in 1858, Juárez enacted a series of laws sharply separating church from state, confiscating church property, and suppressing religious orders. The Catholic Church had grown very powerful and corrupt and habitually supported reactionary leaders. Late in 1862 French troops landed in Mexico with the intention of restoring a reactionary government to power. In 1864 the French installed Archduke Maximilian of Austria as emperor of Mexico. Resistance to Maximilian, who had the support of the church, intensified until an uprising in 1867 overthrew him and restored Juárez to power. The Mexican Revolution of 1910 further entrenched the anticlerical reforms by drastically curbing the political power of the church. Guatemala's story is less happy. Francisco Morazán, now often spoken of as the Father of the Country, was executed by his clerical enemies after enacting a wide range of progressive legislation.

In many Latin American countries the optimistic confidence in their future took the form of Positivism, inspired by the French thinker Auguste COMTE. Positivism brought together Comte's ideas with the progressionist evolutionism of Herbert SPENCER and anticlericalism. Typical of these reformers was Antonio Guzmán Blanco, who ruled Venezuela for almost two decades. Guzmán Blanco is known as "the Regenerator" for his role in building his country. He confiscated church property, established a national church—one less directly dependent on either Rome or Spain—and built much of the young country's infrastructure.

After World War I, Positivism declined in favor of Marxism as the preferred vehicle for anticlerical activity. But by midcentury, much of the initiative had passed from the anticlericals to Catholic radicals who espoused variations of liberation theology. But as these theologians have been progressively squeezed out by church authorities or left the church of their own accord, there may be a revival of anticlericalism, particularly as the church is once again defending a starkly authoritarian position. By and large, Latin American anticlericals succeeded in establishing mainly secular political institutions, but they were less successful in exporting those secular attitudes to large sections of the population. To address this imbalance, contemporary anticlericalism needs to be informed principally by HUMANISM.

Turning to the humanist movement, we see that, for the most part, it has avoided the less helpful excesses of anti-Catholicism employed by Protestant critics. The most significant critic of the Catholic Church in the twentieth century was Joseph MCCABE, who wrote approximately forty-nine books on this theme. Even in his later works, which were more openly adversarial—he described them as his *advocatus diaboli* (devil's advocate) works—McCabe confined his criticism to the workings of the papacy and the writings of its apologists. In a vast body of work spanning more than half a century, there are very few expressions or judgments which could be seen as anti-Catholic in the pejorative sense. The same can be said of most other significant humanist critics of the Catholic Church such as Paul BLANSHARD in the United States. These critics opposed the Roman Catholic Church without being purveyors of a simple anti-Catholicism. A couple of lesser writers, like Avro Manhattan and F. A. Ridley, were more prone to conspiracy theory hysteria reminiscent of older Protestant critics of Rome. This was evident in Manhattan's case, when his later works were published by Protestant publishers linked to the rabid Northern Ireland anti-Catholic Rev. Ian Paisley.

The vast majority of humanist criticism of Roman Catholicism, then, can be seen to fit in the tradition of robust anticlericalism from the standpoint of having rejected the truth claims the church makes about itself and the world. This is a credible viewpoint, and is very different from the simpler anti-Catholicism in which Catholics as people are disparaged or slighted.

And finally, attention should be directed to the literature that has been inspired by anticlerical themes and has been as influential as anticlericalism in politics. The dissolute priest, the scheming cardinal, and the woman whose sexuality has been skewed by repressive dogma have become staples of literature. Denis Diderot probably deserves credit for stimulating this genre, with works like *The Nun* (1796), an account of a woman's life broken by the shackles of convent life. A century later Emile Zola's trilogy, *Rome*, *Lourdes*, and *Paris* (1894–98), and some of the works of Anatole France, in particular *Penguin Island* (1908), became classics of anticlerical literature. Other novels with anticlerical tones could include *A Portrait of the Artist as a Young Man* (1916) by James Joyce; *A.M.D.G.* (1910) by the Spaniard Ramón Pérez de Ayala (see SPANISH LITERATURE, UNBELIEF IN); *The Brothers* (1938) by H. G. Wells; and, more recently, *The Troublesome Offspring of Cardinal Guzman* (1992) by Louis de Bernières. At a more popular level, Dan Brown's runaway bestseller *The Da Vinci Code* (2003) would also figure here. And there have been some important memoirs on Catholic upbringings, from the belligerent *Gathering Evidence* (1982) by Thomas Bernhard, through *Angela's Ashes* (1996) by Frank McCourt, to the gentler—though no less critical—autobiographical works of Karen Armstrong and Anthony Kenny. Films like *Dogma* (1999) and *The Magdalene Sisters* (2002), cartoon series like *Popetown*, and comic characters like Knuckles the Malevolent Nun by Cornelius Stone carry on the tradition in their respective media. These various styles of anticlerical criticism are probably more effective, and certainly better known, than the earlier nonfiction accounts.

BILL COOKE

ARISTOTLE (384–322 BCE), Greek philosopher. In the system set out in his *Metaphysics*, Aristotle invokes the idea of something that provides motive force for movement and change in the universe, and again something that serves as that to which everything tends, which he defines

as "pure thought thinking about itself"; and he identifies these two somethings as the same thing, which his translators render as "God." Some then invoke this as proof that Aristotle shares with conventional theists belief in a deity similar to the God of revealed Judeo-Christian religion.

Religious apologists are eager to interpret references to deity in the works of the "pagan" philosophers as supporting their own theologies. To take another and similar example, they read the Stoics (see STOICISM) as being committed to a god like their own because the Stoics invoked the idea of a principle of rational order in the universe which they variously called *logos*, reason, god, and other names.

But in all these cases, whether of Aristotle, the Stoics, or others, the attempted appropriation of the entities or agencies they postulated in their metaphysical systems are not the deities variously invoked by Jewish, Christian, and Muslim believers. These gods are personal deities who created the world and have a particular interest in the behavior of the human beings in it, commanding obedience to their laws and punishing or rewarding people accordingly as they conform or otherwise. This is very remote from the metaphysical conceptions of Aristotle or the Stoics.

For this reason it is a mistake at best, and intellectually dishonest at worst, to include Aristotle among those who "believed in God" in the sense in which this phrase is used by theists in the Judeo-Christian tradition. A sketch of his system shows clearly why this is so.

Aristotle's *Metaphysics* is the work in which he deals with the question of existence, or, as he puts it, with "being *qua* being." In it he asks what existence is and what its essential attributes are. The key objective in his inquiry is identifying the nature of the primary substance of the universe, this being that which exists in its own right independently of anything else. He defines it as the merging of matter and form. Matter is the basic stuff of things, without specific qualities of its own, but capable of being actualized when merged with form, whereupon it takes on the definite character of an individual thing. Before this it is the purely potential basis of change, growth, and decay.

The transition of potentiality (*dynamis*) to actuality (*entelecheia*) is a principal theme of Aristotle's *Metaphysics*. Potentiality is incomplete and therefore imperfect; actuality in its ideal fulfillment is complete and perfect. Potentiality is determinable (what can be determined or shaped); actuality is determining (what determines). The duality of matter and form is accordingly to be understood as follows: matter is the determinable, form the determining.

Aristotle explains the transition of potentiality to actuality by means of the four kinds of cause that act on things: the material cause, which is what something consists of (such as the wood that is the material out of which a table is made); the efficient cause, which is the work that brings about the actualization of a potential (such as the work done by the carpenter to fashion the wood into a table); the formal cause, which is what determines the nature of an individual thing as the thing it is (such as the plan or design followed by the carpenter in making the table); and the final cause, the aim, end, or purpose for which the thing exists (such as the purpose of eating off or writing on for which the table was brought into existence).

In summary characterization, the four causes can be described as matter, form, agent, and end—the agent being the efficient cause, the end being the final cause.

Of these four causes, the two most important for grasping the nature of any individual thing are the formal and final causes. A full account of anything would invoke all four causes, but these two give the explanation of *what* and *why* a thing is.

For Aristotle, motion and change are eternal in the universe. (This view stands in conscious opposition to the Parmenidean claim that the universe is a single eternal unchanging thing, and that change and motion, as perceived by our finite senses, are illusory). Motion and change are eternal; there cannot have been a first motion, because it would itself have required a preceding motion to set it off—and so on, in infinite regress. But although there cannot have been a first motion, there must be something that keeps the eternal motion of things going—an efficient cause of the sustaining (not the origin) of motion. But this thing cannot itself be moved, because it would require something to move it. So the mover must be unmoved. And this Aristotle therefore calls "the Unmoved Mover."

On some readings of the *Metaphysics* there is not one but many unmoved movers, one each for each of the movements in the spheres constituting the heavens.

This same thing Aristotle defines as the final cause of things too, for it is what everything tends toward in its highest and final realization, for it is "pure thought" thinking about the highest and most perfect thing there is, pure thought—and hence it is pure thought thinking about itself (*noesis noeseos*). As one might expect from a philosopher, Aristotle regarded thinking, and correlatively the contemplative life, as the best and highest activity, from which it naturally follows that the best thing contemplating the best thing must be "thought thinking about thought." Moreover, the only thing that could satisfy the description of being pure actualization, pure activity, without any residual potentiality in it, and therefore without any trace of *materia prima* (primary matter), must be pure thought thinking about itself.

It is hard to see the logic behind Aristotle's identification of the Unmoved Mover (or Movers) with "pure thought thinking about itself," but so he does; and he ventures no explanation of how pure thought can have the mechanical effect of imparting motion and inducing change in things whose causes are, by the definition of causality, material causes. But for those eager to pounce

on apparent similitudes to their own conception of deity, the poetic-sounding "pure thought thinking about itself" moves them to say such things as, "According to this theory God never leaves the eternal repose in which His blessedness consists." Thus do the overlays of conventional religion distort the business of classical metaphysics.

Aristotle would doubtless have been astonished to find his Unmoved Mover(s) being identified with deities to whom prayer and sacrifice are directed, which demand obedience, which reward and punish, and which above all make it the greatest sin to question, doubt, think for oneself (this being the sin of pride), and seek knowledge (the tree of knowledge was forbidden in Eden's garden). Indeed, as regards thinking and seeking knowledge, Aristotle would be not just astonished but disgusted—and would surely point out that if his "god" is the highest ideal thing, that is, thought, doing the highest ideal thing, that is, thinking, it is an extraordinary contradiction to identify it with a God who says that thinking is sinful and demands unthinking obedience in its place.

The appropriation of Aristotle into Christian theology is chiefly the work of Saint Thomas Aquinas, the "Angelic Doctor." In his *Summa Theologica* he praises Aristotle's conception of "the Godhead," but observes that this is not a personal deity with a "loving care and interest in His creation" (this leaves aside the fact that the Mover is not for Aristotle a creator). And this means that Aristotle's god will not do as "God," because (as the *Catholic Encyclopedia* puts it) his god is not one "to Whom all rational beings are responsible for their every thought, word and act"; it is not "the God of Faith and Revelation, the God of the Nicene Creed, in substance One, in personality Three."

These remarks speak for themselves, since the Unmoved Mover of Aristotle is at least not the amalgam of credulity, superstition, and contradiction, which is what the last eighteen words of the preceding paragraph denote. It is instead a metaphysical entity postulated to fit and complete a metaphysical structure; and its intelligibility stands or falls with that structure.

A. C. Grayling

ARNOLD, MATTHEW (1822–1888), English poet and essayist. One of the most influential English poets and essayists of the nineteenth century, Matthew Arnold was born on Christmas Eve 1822, at Laleham, England. He was the son of Thomas Arnold, a prominent Church of England clergyman who made his reputation as headmaster of Rugby School. Matthew was educated at Rugby and Oxford. Much of his working life was spent as an inspector of schools, which gave him insights into the important changes Victorian Britain was undergoing.

Arnold's real vocation, however, was as a poet and critic. Though his period of poetic creativity was relatively short—he wrote little of significance after he was thirty-five years old—Arnold captured the Victorian crisis of faith as few others were able to do. By the time Arnold was appointed professor of poetry at Oxford in 1857, his career as poet was coming to an end, but his second career, as critic and essayist, was about to begin.

Arnold's genius was to understand and articulate the shifting tide of belief in Victorian England, in particular the decline of conventional piety. He understood, because he felt himself, the rootlessness and uncertainty of the new society that was emerging. If Arnold had little use for the dogmas then declining, he nonetheless felt their departure keenly. Arnold was without belief in a personal God or immortality and was actively uninterested in the details of dogma. He addressed this in his poem "Pis-Aller" (1867), in which a dogmatist asserts a range of things, ending, "Without that, all's dark for men / That, or nothing, I believe" and to which Arnold retorts, "For God's sake, believe it then!"

For many years Arnold was best known for his popular work *Culture and Anarchy* (1869), which argues for the value of a cultural knowledge as a bulwark against anarchy and loss of certainties. Arnold's critics have accused him of an elitist despair at the inability of the mass of the people to appreciate the glories of classicism. There is an element of truth to this charge, although Arnold deprecated philistinism from whatever class it originated.

More recently, his poem "Dover Beach" (written in 1851, published in 1867) has become Arnold's most emblematic work. "Dover Beach" is a lament on the decline of religion in Europe and features the phrase "sea of faith," which was taken up by the heretical English theologian Don Cupitt and used as the name of a religious humanist network in England, with important offshoots in Australia, Canada, and New Zealand (see Religious Humanism).

Matthew Arnold died on April 15, 1888, while on his way to Liverpool to see his daughter, who was returning from New York.

ARTS, UNBELIEF AND THE. It is more important than usual in a topic such as this to first define our terms. *Unbelief* is the more problematic term because, by its

very nature, it is defined in negative terms. There are two senses in which unbelief will be relevant here. On the one hand it is a loose, umbrella term to cover all worldviews that are grounded in the natural world, as opposed to the many varieties of belief that are supernaturalist in orientation. And on the other hand unbelief suggests an opposition to all forms of orthodoxies, be they religious or secular. The principal feature both understandings of unbelief have in common, then, is their opposition to all attempts to straitjacket free inquiry. After this commonality has been acknowledged, unbelievers have very little in common, because, having rejected straitjackets—be they political, social, religious, or intellectual—they then proceed to believe a great many things. With respect to supernaturalism alone, an unbeliever may be an atheist, agnostic, deist, pantheist, or any other variety of heterodox belief (see ATHEISM; AGNOSTICISM; DEISM; PANTHEISM AND UNBELIEF; and CONTROVERSIES: ATHEISM, PANTHEISM, SPINOZA). The sole guiding motif of unbelief, then, is the imperative for freethinking. With that in mind, this entry will speak of FREETHOUGHT instead of unbelief.

Turning to art, we can begin with the conventional understanding as referring to all styles of visual art, performing art, and music. What is needed now are some formulas by which we can continue our investigation. For this we can turn to the Australian philosopher John Passmore, who distinguished three forms of art. There is entertainment art, which is designed to create a high level of excitement or an easy level of listenability, as a means of escape. Then there is what he called telic art, which induces us to care about some cause, religion, movement, or philosophy. And then there is serious art, which Passmore defines negatively and simply as art that is largely independent of the other strands.

Passmore acknowledges that there is no sharp distinction between these three, and that any piece of art can involve more than one category at once. However, he goes on to say that serious art is absolutely serious, in the way that entertainment art is not absolutely entertainment or telic art absolutely telic. The term *serious art* is an unfortunate one, which can give the wrong impression. Contrary to first impressions, serious art can excite, divert, and amuse, in the manner of entertainment art. And it can inspire, even preach, in the manner of telic art. The point is that serious art is not limited or bound by these qualities.

A clear illustration is Picasso's *Guernica*, which was created with a view to inducing the viewer to care about the German destruction of the Spanish town of that name during the Spanish Civil War and, more generally, to abhor the brutality of war. In this sense, *Guernica* is telic art. But long after the passions aroused by the Spanish Civil War have eased, *Guernica* is still a moving work of art. In Passmore's categories, *Guernica* was created as telic art and has since made the transition to serious art with telic overtones.

Passmore's distinctions are useful for our purposes. It is clear that all art commissioned in the service of a ruling orthodoxy, whether religious or secular, is going to have significant characteristics of telic art. In some cases, the genre is so stifling that it is next to impossible for serious art to emerge from it, socialist realism being a prime example. Relatively few works of telic art are able to make the transition *Guernica* has achieved.

Turning more specifically to the relations between religion and art, we need at this stage to introduce another series of distinctions. Diane Apostolos-Cappadona has identified five basic types of relation between religion and art. These relations run along a spectrum from, at the negative end, the authoritarian relation, where religion dominates art, through the oppositionist relation, where both are in relations of equality but are seeking to dominate each other. In the middle is the mutual relation, where art and religion are in relations of equality and are working symbiotically. Then there is the separatist relation, where religion and art operate without reference to each other. And finally, Apostolos-Cappadona cites what she calls the unified relation, where religion and art operate as one identity with no attempt to make distinctions. It is clear that Apostolos-Cappadona sees this unified relation as the highest of the forms of interaction between religion and art.

This is a thoughtful framework, but it has consequences for which Apostolos-Cappadona made no allowance, principally the imbalance of evidence for each of these relations. Sadly, history is replete with evidence of the authoritarian relation at work, whereas the unified relation remains a pipe dream. Remaining with Apostolos-Cappadona's framework, we can say that the mutual relation may well be the ideal one, but the separatist relation is probably the best that can realistically be managed. And it follows from this that for either of these relations to flourish, the society needs to be thoroughly secular, if not operating on a formal separation of church and state (see SECULARISM). Telic art has thrived in societies that are not open societies, in the sense by which Karl POPPER understood that term. Popper spoke of an open society as one where people are presented with choices as a normal part of their life experience. An open society has a transparent mechanism by which governments can be replaced by the people. Such a society has institutions for which the individual can work by virtue of merit, or transact business by virtue of citizenship. Closed societies, by contrast, have no reliable mechanism by which leaders are replaced, and institutions are hedged in by limitations of class, creed, or culture. It is central to telic art that only one credible choice should be urged on the viewer, and it has traditionally been the role of the closed society to limit or even persecute all paths save the officially sanctioned one. In short, there has long been a symbiotic relation between telic art and the closed society, which is expressed most clearly in the authoritarian relation between art and religion.

We need now to examine closely the sources of this preference for the authoritarian relation between religion and art. For the time being, by *religion*, I will be referring only to the Western monotheistic faiths and to universalizing ideologies, be they secular or religious. Among many defenders of orthodoxy, there has long been a suspicion of serious art. For the defenders of orthodoxy, art not commissioned for the instruction of the people is art to fear and to control. It has long been noted that the more stern the upholders of supernaturalism are, the more likely are such thinkers to take a dim view of the arts. The classic example is PLATO, who saw artists and poets as a danger to the ideal republic he dreamed of. Plato has SOCRATES insisting that if poets cannot portray good character in their poems, they should refrain from writing. Socrates goes further: We "must issue similar orders to all artists and craftsmen, and prevent them portraying bad character, ill-discipline, meanness, or ugliness in pictures of living things, in sculpture, architecture, or any work or art, and if they are unable to comply they must be forbidden to practise their art among us." Plato's objection to art was that it seduced people to be satisfied with a thirdhand representation of reality. The artist's representation of an object is one step removed from the actual object, which itself is one step removed from the archetypal form of that object. And it is the archetypal form of the object that should be the object of our contemplation, not the mere physical representation of it, and certainly not the artistic representation of the physical representation.

In Plato's mind, art's only justifiable use is to produce propaganda, much like Stalinist socialist realism; it has to sing the praises of the state, decry the follies of foreigners, and tell us how happy and lucky we are. Unless the arts are managed in this way, Plato saw only trouble ahead because artists know nothing of the truth and can only indulge in superficiality.

Significant elements of Plato's distrust of the arts were taken up by the Christian religion, and, later again, by Islam. More precisely, these Platonist fears merged with a suspicion of art that was indigenous to the monotheistic religions. For the monotheistic religions, the suspicion of art had more of a moral tinge than the intellectual fear on which Plato concentrated. Plato was not distrustful of beauty so much as unconvinced that artists were capable of grasping the ethereal majesty of the abstract beauty as he understood it. For Christians and Muslims, beauty was the inevitable product of their creator God. This meant that ugliness, depravity, or any message suggestive of sedition or laxity of morals had to derive from some alternative source. These usually turned out to be some combination of the hubris of the unbeliever or the malice of Satan, or, more usually, a combination of these.

The prophet Amos gave voice to this suspicion when he declared: "I hate, I despise your feasts, and I will not smell the savor of your assemblies. . . . Take thou away from me the noise of thy songs; for I will not hear the melody of thy viols. But let judgment roll down as waters and righteousness as an ever-flowing stream." This deep suspicion of the arts and the levity it is thought to bring in its train has been echoed right down through the history of monotheist religions. From the iconoclasts to the Puritans to today's religious conservatives in the culture wars, all follow in the footsteps of Amos.

The situation is no less fraught with respect to the Christian religion, for the second commandment forbids making images for worship: "You shall make for yourself no idol in the likeness of anything in the heavens above or on the earth below or in the waters under the earth. You shall not bow down to them or serve them; for I, the Lord your God, am a God who brooks no rival. . . ." (Exod. 20:4–5). The prohibition against idols is broadly conceived and fiercely worded. The sin of hubris in making the idol is compounded by the sin of turning away from the true god.

Christian history has seen successive waves of Puritanism that took this commandment at face value. The iconoclasts during the Byzantine Empire of the eighth century CE took the movement to the extremes of systematic destruction of what they saw as idolatrous images standing in between the individual and God. And the very music that now inspires believers was once held in deep suspicion. In 1322 Pope John XXII denounced the use of counterpoint in church services, declaring such musical harmony fit only for profane uses. During the Reformation followers of Huldrych Zwingli's brand of Protestantism whitewashed church walls to ensure the faithful would have no idolatrous image to distract their attention from the word of God as given by the sermon. John Calvin shared a similar hostility to religious imagery. God, Calvin believed, could not be represented pictorially, so any attempt to do so would be bound to fail, and the moral and spiritual consequences of that failure were too fearful to contemplate. For Calvin, attempts to render God pictorially would inevitably result in idolatry, which ran up against the proscriptions in the book of Exodus. The effect of Calvin's censorship was to force art into producing openly telic work, or to sidestep the issue by focusing on landscapes and domestic environments, much of which was little more than entertainment art.

This deep hostility to images is shared by Muslims, who see Allah as incomparably unique and insist on an unbridgeable gulf between the creator and his creatures. Any attempt to intercede between humanity and Allah is bound to fail and bound to be tinged with wickedness. Following on from this, any attempt to portray Allah by human hands is bound to produce only the worst form of blasphemous idolatry: "Who is he that can intercede with Him but by His permission? He knows what is before them and what is behind them. And they encompass nothing of his knowledge except what He pleases." Very much in the manner of Amos, the Qur'an asks

rhetorically: "Is one decked with ornaments and unable to make plain speech in disputes a partner with God?" And again: "Shall I inform you upon whom the devils descend? They descend upon every lying, sinful one—They give ear, and most of them are liars. And the poets—the deviators follow them." It is not that Islam is hostile to art as a whole, but like other monotheistic religions, Islam insists on the right to circumscribe art until it conforms to its view of the world. This means that while beautiful telic art can still be made in conformity with Islam, it is not as straightforward for serious art.

This is not to say that all religions hold to this suspicion of images and image makers; Roman Catholic and Orthodox Christianity—and significant strands within Hinduism and Buddhism—have been awash with artistic representations, though, as if to confirm the fears of the Protestants, the images have often been the focus of veneration in themselves. And in the case of Catholic and Orthodox Christianity, their greater ease with images has not meant they have avoided the authoritarian relation between religion and art.

When we turn our attention specifically to freethought and art, we can see that the situation is considerably more simple. If religious attitudes toward art range from ambivalence to downright hostility, freethinkers have taken unalloyed joy in the arts. It has been a staple of humanist thinking that, in the absence of a preordained cosmic purpose, people must determine meaning and value in their own lives (see ETHICS AND UNBELIEF; MORALITY FROM A HUMANIST POSITION; and LIFE STANCE). Appreciation of the arts has always been an important component in that process. To take one example, pretty much at random, the Chinese sage CONFUCIUS said that the arts were an integral part of understanding the Way, or the core reality of life: "I set my heart on the Way, base myself on virtue, lean upon benevolence for support and take my recreation in the arts." Elsewhere it was reported that Confucius was once so transfigured by the beauty of some music he heard that he failed to notice the taste of the meat he ate for three months.

Freethinkers appreciate art for precisely the reason Plato feared it. Plato saw artists as almost constitutionally dishonest for providing people with pleasing images that serve to lessen our zeal for the disembodied form of the Good. In rejecting that and other supernaturalist abstractions—what Daniel Dennett called skyhooks—freethinkers relish the opportunity to have the universe drawn for them anew by artists. In an interesting dialogue on art, Iris Murdoch has her Plato decry art's dishonesty while another character, Acastos, argues for art's role as a vehicle for profound meaning without imposing the duty on artists to do nothing but provide meaningful art. The duty of artists, Acastos says, is to be good artists. It is up to everyone else to determine the extent and nature of the message they glean from art. Murdoch has her Socrates conclude by saying we should be thankful for great artists who "draw away the veil of anxiety and selfishness and show us, even for a moment, another world, a real world, and tell us a little bit of truth."

Freethinkers recognize that truth needs to be sought out by curious humans, rather than discovered intact through passive worship or prayer. The length and strength of the hostility between monotheistic religions and open-ended artistic creativity brings to mind the no less long-standing conflict between science and religion (see RELIGION IN CONFLICT WITH SCIENCE). Monotheistic religion is by its very nature hostile to the NATURALISM of science, because it undermines the anthropocentric foundations of religious belief. Many philosophers have noted that art and science have more in common than art and religion. Art and science are both truth-seeking pursuits, and both flourish best in an open society. Art and science both want to understand the world on its own terms and not according to some prearranged formula. Telic science is even more unhelpful than telic art, as the examples of Lysenkoism in the Soviet Union or "intelligent design" in the United States (see INTELLIGENT DESIGN THEORY) amply demonstrate. And unlike telic art, telic science will never be able to climb out of its intellectual hole and make a serious contribution.

Art and science are both exercises in human creativity. We need now to consider the relation between unbelief and creativity. When thinking of some of the most creative periods of human history, periods that used to be called golden ages, several features can be found in common. Chief among these is an attitude of confidence about the values of one's own culture without this descending into paranoia about foreigners. Then there is economic prosperity that enables the wealthy to patronize the arts and humanities. We can find important commonalities here between fifth-century Athens, Florence during the Renaissance, the T'ang dynasty in China, England in the century after the Armada, and Holland in the seventeenth century.

In each of these ages, we find greater levels of intellectual freedom, artistic activity, and religious heterodoxy. These are what make a golden age. Looking briefly at two examples, the T'ang dynasty in China is generally recognized as the dynasty most open to foreign influences. T'ang military and diplomatic power stretched all the way to central Asia and Persia and south to Vietnam and beyond. Merchants, diplomats, and adventurers of all stripes lived in the T'ang capital of Ch'ang-an, practicing their religions freely and discussing their views with one another. It was also known for unsurpassed levels of artistic creativity. The T'ang golden age began to fade after—something unusual for China—a series of persecutions against foreign beliefs. The persecutions were successful, and the heresies were largely extirpated, but the intellectual ferment their existence had helped to facilitate ended with them. The art of the Sung dynasty that followed was more self-contained, drawing inspiration from within its own culture. But

once the wellsprings of creativity from within had drained, the Ming and Ching dynasties which followed produced art no less skillfully executed, but which was derivative of earlier forms.

We can see a similar pattern with respect to the Italian Renaissance. Each of the milestones commonly cited as significant diminutions of the Renaissance spirit were made in the name of defending some version of orthodoxy. From the puritanical rantings of Savonarola—very suggestive of Amos—to the sacking of Rome in 1527, to the enforcement of the Counter-Reformation with the Council of Trent, each of these helped crush the spirit of optimism and inquiry. And with the effective strangulation of those motive forces, the artistic spirit was severely circumscribed.

Despite the evidence of history, it has long been a staple of popular Christian apologetics to assert the essential link between art and religion. In the West, the Renaissance artists are most frequently pointed to as evidence. But Renaissance art tells us more about power relationships—Apostolos-Cappadona's authoritarian relationship, to be specific—than it does about links of this sort. That an artist is responsible for a beautiful work on the Virgin and child is no evidence that he was motivated by Christian piety. In a culture where the church commissioned most of the important work, it is hardly surprising that most art of the time reflected its beliefs and taste. And if a gifted artist is to be credited with Christian religiosity for his sensitive rendering of a Christian theme, then he needs also to be praised for his authentic paganism for producing a brilliant work on a theme from Greek mythology.

Freethought is important not merely for providing the best cultural backdrop for artistic flowering; in some important cases it is integral to its survival. It has frequently been observed, for instance, that monotheistic religion is antithetical to the spirit of tragedy because the religious promise of redemption drains tragedy of its meaning. The implications for this are manifold, because tragedy has played a disproportionately important role, at least in European art. From the Greek playwrights through to Shakespeare, to say nothing of the visual art and music that tragic themes have inspired, tragedy has been an ongoing strand by which artists have explored the dilemma of being human. Friedrich NIETZSCHE viewed Attic tragedy as the apotheosis of the Apollonian and Dionysian forms of art. Art, Nietzsche wrote, "raises its head where the religions relax their hold." For Nietzsche, art takes over a whole range of moods and feelings that religions cannot understand or sympathize with, infusing them with new and more powerful meanings. Tragedy speaks of the fatal flaw in human nature: the tragic hero is greater than the rest of us, but his flaws are also larger than life, and lead inevitably to his ruin. The simplistic binary of good and evil is corrosive of the more nuanced understanding of human nature that tragedy grasps. And the illusion of eternal reward directly undermines the tragic impulse. On this understanding, tragedy is the most profound manifestation of humanist aesthetics. The enlightened acceptance of what life deals us, and of our inevitably flawed and frequently counterproductive responses to life's challenges, constitutes the core of the human experience.

It is one thing to acknowledge that freethought is an important precondition for major forms of art such as tragedy. But what about the many artists who have been motivated by religious beliefs? The fact that many artists have been inspired by religious beliefs only strengthens the bonds between freethought and art. It is important to note what is not being asserted here. Clearly, it is not that artists need to be unbelievers in order to function. Rather, the argument is that the spirit of free inquiry is a precondition of artistic creativity and the surest guarantee that serious art, whether created by religious or nonreligious artists, will not lapse into telic or entertainment art. We have seen that artistic golden ages were frequently also periods of unusual acceptance of the right to free inquiry. And it should also be noted that many artists' religiosity is of a distinctly heterodox character. Ludwig van Beethoven, to take one prominent example, is thought by many to be the greatest composer of all time. His musical repertoire consists of nine symphonies, five piano concertos, thirty-two piano sonatas, and sixteen string quartets. Beethoven was not a churchgoer and was suspicious of any sort of orthodoxy, religious or secular. He composed very little religious music, in the narrower sense of the term. His most ostensibly religious piece was *Missa Solemnis*, which was first completed in 1824 and played in St. Petersburg soon after. The *Missa Solemnis* is, in fact, a hymn to DEISM, and evokes the ideal not of humanity managing to qualify for entrance into a distant heaven above, but of humanity living authentically and fully here on earth. Examples such as this could be multiplied. Among painters we could range from the mystical THEOSOPHY of Wassily Kandinsky to the Zen Buddhism of Ad Reinhardt; from the Jungianism of Jackson Pollock to the atheism of Francis Bacon, from the antirationalism of Donald Judd to the pseudo-Wittgensteinianism of the conceptual artists (see WITTGENSTEIN, LUDWIG); they all needed a minimal level of outside ideological constraint before they could produce serious art.

And finally, it is worth noting how many significant artists have been unbelievers in whichever brand of supernaturalism was dominant in their culture. Take the example of nineteenth- and twentieth-century novelists. People as different in other respects as Thomas HARDY and Philip Pullman, H. G. WELLS and Fay Weldon, Arnold Bennett and Iain Banks, Somerset Maugham and Iris Murdoch, Mark Twain (see CLEMENS, SAMUEL LANGHORNE) and V. S. Naipaul are all unbelievers in conventional religion. Examples among playwrights and musicians could also be given. The fact of the diversity

of religious views among artists is a strong argument for seeing the separatist relation between art and religion in more positive terms than Apostolos-Cappadona assumed. Indeed, it can reasonably be claimed that the separatist relation between religion and art is the best guarantee of unfettered artistic creativity.

The conclusion that can be drawn from all this is that the bonds linking art and freethought are comprehensive and inevitably intertwined. Freethought is about life freed from the transcendental temptation. A life with no reference to the supposed promise of an afterlife needs to be made as meaningful and delightful as possible, and art clearly has a crucial role in achieving that. In the absence of truths being imparted to us on tablets of stone, art can help us search for truth in any number of different ways. And *truth* in this context should not be confused with a set of commands. Freethinking can have no truck with telic art, in Passmore's usage, or the authoritarian relation, to use Apostolos-Cappadona's. The relation between freethought and art is entirely symbiotic. Art needs the conditions of free inquiry in order to thrive, and freethought needs art to give meaning and color to life in the here and now. Here is Apostolos-Cappadona's mutual relation in action, no pipe dream after all.

There is no limit to the way people can find meaning, purpose, contentment, and peace of mind in their lives. There is no formal body of dogma that must be protected from art's searching gaze. There are no sensitive issues that need to be deemed no-go zones. Artistic creativity requires freedom; freedom requires an open society; and an open society requires at the very least the absence of the authoritarian relation between religion and art. This condition is best achieved in a society imbued with the humanist principles of toleration, secularism, and freethought.

BILL COOKE

ASIMOV, ISAAC (1920–1992), American author. One of the most prolific and versatile writers in recorded history, Isaac Asimov was the greatest popularizer of science of his generation.

Asimov was born in Petrovichi, Russia, two years before the formation of the USSR. When Isaac was three years old, his family immigrated to Brooklyn, New York, where his father operated a candy store. The oldest of three children, Isaac taught himself to read English before starting school.

Although Asimov's parents were Orthodox Jews, they did not impart their religious beliefs to him. His ATHEISM was not, therefore, an act of rebellion. Rather, unencumbered by a religious upbringing, Asimov's insatiable curiosity and love of reading steered him toward a rational, secular worldview. Reading Greek and Norse mythology convinced him that the Bible was Hebrew mythology.

Education and Family. Trained as a biochemist, Asimov earned a doctorate in chemistry at Columbia University in 1948, where he began writing science fiction. During World War II, he served in the army and worked as a chemist at the Naval Air Experimental Station in Philadelphia. He suffered from acrophobia, and his time in the service was the only time in his life that he ever flew. Asimov had a son and a daughter from his first marriage, which ended in divorce. In 1973 he married Dr. Janet Jeppson.

Writing. Asimov wrote or edited about five hundred books, including popular books on numerous branches of science, science fiction, history, literature, mysteries, religion, mathematics, and books for children. At the age of eighteen, he began submitting short stories to science fiction magazines, making his first sale in 1938 to *Amazing Stories*. "Nightfall," published in 1941, explored the conflict between science and myth on a planet with six suns that experiences darkness once every

2,049 years. The Science Fiction Writers of America voted it the best short story ever written in the genre. In 1949 Asimov joined the faculty at the Boston University Medical School, and in Boston he wrote his first novel, *Pebble in the Sky*. He began writing full time in 1958.

Asimov is best known for his science fiction, particularly his Foundation Trilogy, for which he won the Hugo Award in 1966 for Best All-Time Science Fiction Series, and for his robot novels. Asimov lived to write, and wrote to explain the world to everyone else. When asked what he would do if he learned he was shortly going to die, he responded that he would type faster.

Humanism. Through his writings, Asimov presented the excitement of science, promoted skepticism, and critiqued the paranormal, pseudoscience, and creationism. But perhaps his greatest contribution was in showing that there are many different areas of study that can lead toward a secular and humanistic philosophy. *Asimov's Guide to the Bible*, written from a strictly humanist viewpoint, was published in 1968. *In the Beginning*, published in 1981, compares the Genesis myth unfavorably with the scientific account of origins.

Asimov's humanism was further evidenced by the causes he supported and publicized, including human and civil rights. He warned against the dangers of overpopulation and fought against censorship. Asimov was a signatory of *Humanist Manifesto II*, published in 1973. He was named Humanist of the Year in 1984 by the AMERICAN HUMANIST ASSOCIATION (AHA), and served as AHA president from 1985 to 1992.

Asimov was never tempted toward religion, nor did he report experiencing a spiritual void. As a rationalist, he found a worldview without the supernatural totally satisfying. He wrote that he found atheism liberating, because it removed the fear of death and hell. He said he did not worry about death, because every idea he ever had was published. This, along with his children, was the only immortality he desired. He died in 1992, four months after the dissolution of the Soviet Union.

KENNETH MARSALEK

ATENEOS. These nineteenth- and twentieth-century cultural associations of Spain and Latin America took their name from the Athenaeums founded by French Enlightenment thinkers of the eighteenth century (see ENLIGHTENMENT, THE, AND UNBELIEF). Their concept of the Atheneum was inspired by the advanced school founded by the Spanish-born Emperor Hadrian at Rome around 135 to encourage literary and scientific study, itself based on the pagan and arguably rationalist inspiration of the Ateneum, the temple at Athens, Greece, erected in honor of Pallas Athena, goddess of reason and the inventor of the arts, agriculture, and industry.

In Spain the Ateneos were successor institutions to the eighteenth-century Sociedades Económicas de Amigos del País (Economic societies of friends of the country). The Ateneos played an important role in familiarizing the cultured circles of society with the bourgeois and secularizing ideals of the French Revolution. Already these ideals had shaped the liberalizing Constitution of Cadiz of 1812. The Ateneo of Madrid was founded in 1820 to "calmly and amicably discuss matters about legislation, politics, economy, and, in general, about everything which may be considered of *public usefulness*." The restoration of absolute monarchy by Ferdinand VII prompted its closure between 1823 and 1835, when it resumed its activities in a new headquarters and under the presidency of the duke of Rivas.

This Ateneo, with its divisions devoted to the sciences, arts, and humanities, its lending library, and its theatre and exhibition halls was greatly admired, prompting the creation of local Ateneos across Spain (including Cádiz in 1858, Barcelona in 1860, Zaragoza in 1864, Sevilla in 1877, and Valencia in 1879). Ateneos were also established across Latin America, including the Ateneo de la Plata of Buenos Aires in 1858, Puerto Rico in 1876, Santiago de Cuba in 1879, Uruguay in 1881, Lima in 1886, and México in 1909. Generally opposed to the thinking and social policies of the Roman Catholic Church, the *Ateneos liberales* (liberal Atheneums) represented the ideals of HUMANISM, RATIONALISM, and the Enlightenment across the Spanish-speaking world.

During the nineteenth century, the Ateneos helped to transmit emerging ideas such as DARWINISM, utopian and scientific socialism, and women's equality. Linked with the Ateneo of Cádiz, for example, was the fortnightly magazine *El Pensil Gaditano* edited by María Josefa Zapata, which celebrated human progress and spotlighted the necessity of overcoming social inequalities. The magazine championed equality between the sexes, opposed the double exploitation of working women who are also homemakers, and attacked the bourgeois marriage institution as "a buying and selling between father and husband." *El Pensil Gaditano* was

censored by the bishop of Cádiz, who ordered its closure in 1859.

Contributing to the progress of the arts, science, and literature, the Ateneos achieved enormous political, social, and cultural influence. Following the Revolution of 1868 the Ateneo of Madrid supported the development of a theory of liberal monarchy. During the First Republic the intellectual superiority of "the devil of the critic" over the "sweet traditional faith" was there proclaimed in 1878. It was the scene of significant debates about protectionism and customs duties reform, the anticholera vaccine discovered by Jaime Ferrán, and others. But if the nineteenth-century Ateneo was intellectually adventurous, it also tended to be elitist and socially exclusive. For example, it lent ideological support by the restoration to Antonio Cánovas del Castillo, who helped restore the Bourbon monarchy and was a dominant conservative force in Spanish politics during the later nineteenth century. This elitism drove the formation of the *Ateneos Obreros* (Working-class Atheneums). These associations dedicated themselves to teaching working people to read and write and to instill the habit of reading in the masses, in part to facilitate the development of trade unions.

The special significance of pedagogic movements such as the Institución Libre de la Enseñanza in Madrid; the Extensión Universitaria in Oviedo, the oldest in Spain; and the Escola Moderna in Barcelona (see FERRER, FRANCISCO; ANARCHISM AND UNBELIEF) at the beginning of the twentieth century encouraged the *Ateneos burgueses* (bourgeois Atheneums) to redouble their efforts in order to encourage scientific culture. At the same time the *Ateneos Obreros* agitated for free, high-quality public education. In 1914 Barcelona's city council opened a local schools network for teaching the working classes to read and write under the pressure from the anarchist-oriented *Ateneos libertarios* (libertarian Atheneums). These Ateneos proliferated with the advent of the Second Republic (1930–36) at the same time as the Ateneo of Madrid, under the presidency of Manuel Azaña, adopted a more radical position in its fight for public education and against the privileges of the Catholic Church.

During Franco's dictatorship the Ateneos declined or disappeared, but with the advent of the democracy in 1976 they flourished again. In 1994, in collaboration with the INTERNATIONAL HUMANIST AND ETHICAL UNION, a conference called "Humanism and Ethics" was organized at Madrid. Today there are some fifty functioning Ateneos across the Hispanic world, fifteen of them in Spain. Its current president, Carlos París, advocates radical humanism.

ATHEISM.

INTRODUCTION

In its broadest sense *atheism*, from the Greek *a* ("without") and *theos* ("deity"), standardly refers to the denial of the existence of any god or gods. In contrast to this strong or positive sense of atheism there is a weak or negative sense that is also compatible with its Greek roots. To be "without" god is not necessarily to deny the existence of any deity; it can simply mean not having a belief in any. Although atheism is often contrasted with AGNOSTICISM—the view that one cannot know whether or not any deity exists and hence one should suspend belief—agnosticism entails this latter type of negative atheism (see AGNOSTICISM AND ATHEISM).

Historically, *atheism* has sometimes been used as a term of abuse to refer to religious positions that the speaker opposes. Thus, the first Christians were called atheists because they denied the existence of the Roman deities. However, in Western society the term atheism has most frequently been used to refer to the denial of theism, in particular Judeo-Christian theism. This is the position that a being that is all-powerful, all-knowing, and all-good exists who is the creator of the universe and who takes an active interest in human concerns, and guides his creatures by revelation. Theism, however, is not a characteristic of all religions. While the theistic tradition is fully developed in Hinduism in the Bhagavad-Gita, the earlier Upanishads teach that ultimate reality, Brahman, is impersonal. Theravada Buddhism and Jainism also reject a theistic creator god, but they accept numerous lesser gods. At most they are atheistic in the narrow sense of rejecting theism.

Positive atheists reject the theistic God and with it belief in an afterlife, in a cosmic destiny, in a supernatural origin of the universe, in an immortal soul, in the

revealed nature of the Bible and Qur'an, and in a religious foundation of morality. Positive atheism in its broadest sense also rejects both the theistic and the pantheistic aspects of Hinduism as well as the lesser gods of Theravada Buddhism and Jainism.

In the Western world, nonbelief in the existence of God is a widespread phenomenon with a long and distinguished history. Philosophers of the ancient world such as LUCRETIUS were nonbelievers, and leading thinkers of the Enlightenment such as Baron D'HOLBACH and DIDEROT were professed atheists. Even in the Middle Ages there were skeptical and naturalistic currents of thought. Expressions of nonbelief are found, moreover, in the literature of the Western world: in the writings of Percy Bysshe SHELLEY, Lord BYRON, and Thomas HARDY; VOLTAIRE and Jean-Paul SARTRE; Ivan Turgenev, Mark Twain (Samuel CLEMENS), and Upton SINCLAIR. In the nineteenth century the most articulate and best-known atheists and critics of religion were Ludwig FEUERBACH, Karl MARX, Arthur SCHOPENHAUER, and Friedrich NIETZSCHE. Bertrand RUSSELL, Sigmund FREUD, and Sartre were among the twentieth century's most influential atheists. At the end of the twentieth century, nonbelievers were found from the Netherlands to New Zealand, from Canada to China, from Spain to South America. It was estimated in the 2002 *New York Times Almanac* that there were about 222 million professed atheists in the world, comprising approximately 4 percent of the world's population. Add to that figure people who are agnostic, who profess no religion, and who are indifferent to religion, and the total is 887 million people, or approximately 15 percent of the world's population.

There are several prevalent misunderstandings of atheism, among them that atheists are immoral; that morality cannot be justified without belief in God; and that life has no purpose without belief in God. However, there is no evidence to suppose that atheists are any less moral than believers; many moral systems have been developed that do not presuppose the existence of supernatural beings; and the purpose of life can be based on secular goals such as the betterment of humankind. Indeed, atheism has wide-ranging implications for the human condition, for most versions of atheism entail that ethical goals must be determined by secular aims and concerns, that human beings must take charge of their own destiny, and that death is the end of human existence.

Atheism has sometimes been associated with MATERIALISM, communism, and RATIONALISM. However, there is no necessary relation between it and these other positions. Some atheists have been opposed to communism and some have rejected materialism. Although all contemporary materialists are atheists, EPICURUS, an ancient materialist, believed that the gods were made of atoms. Rationalists such as René DESCARTES have believed in God, while atheistic existentialists such as Sartre are not considered to be rationalists. Atheism has also sometimes been associated with systems of thought that reject authority, such as anarchism and existentialism, but again there is no necessary connection to these other positions. The analytic philosopher A. J. AYER was an atheist who opposed existentialism, while Søren KIERKEGAARD was an existentialist who accepted God. In turn, Marx was an atheist who rejected anarchism but Lev TOLSTOY, a Christian, embraced it.

In contemporary philosophical thought, atheism has been defended by, among others, Paul Edwards, Antony Flew, Paul Kurtz, John MACKIE, Michael Martin, Kai Nielsen, Michael Scriven, and J. J. C. Smart. Leading organizations of unbelief in the United States include American Atheists, the International Academy of Humanism, the AMERICAN HUMANIST ASSOCIATION, the AMERICAN RATIONALIST FEDERATION, Atheists United, the Council for Secular Humanism, the Freedom From Religion Foundation, the Committee for the Scientific Study of Religion, and the Internet Infidels.

JUSTIFICATION OF NEGATIVE ATHEISM

Philosophically, atheism is justified in two different ways. Negative atheists attempt to establish their position by showing that the standard arguments for the existence of God are unsound. Positive atheists attempt to show that there are good grounds for disbelieving in God. Let us consider first the most important arguments for the existence of God (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST).

The Cosmological (First Cause) Argument. Three versions of the Cosmological Argument can be distinguished. Aquinas in his Third Way argued that since there are contingent beings there must be a necessary being, namely, God, that is distinct from the universe itself. However, this argument seems to commit the fallacy of composition—of assuming that the whole of the universe cannot be necessary since it is made of contingent parts—and, once explicated, contains several other dubious premises. Aquinas's argument also assumes without warrant that a necessary being must have all of the attributes of God.

The Kalam Cosmological Argument, associated in contemporary thought with William Lane Craig, assumes that the universe has a beginning in time and that God caused this beginning. To be sure, Big Bang cosmology teaches that there is a temporal beginning to the universe. However, this provides no support for theism. First of all, the universe could have arisen spontaneously; that is, "out of nothing." Several well-known cosmologists have embraced this view, and it is not to be dismissed as impossible. Second, the cause of the universe need not be God. It could be a malevolent being or an impersonal force. Third, it is unclear how God could have caused the Big Bang since time was supposed to have been created in the Big Bang. God could not have

caused the universe in any sense we understand since a cause is temporally prior to its effect. In particular, intentions and desires are temporally prior to their effects. How then could God's intentions cause the Big Bang?

A third version of the Cosmological Argument is based on Leibniz's principle of sufficient reason, namely, that there must be a sufficient reason for everything, and since there cannot be an infinite regress of reasons, there must be a being that is the reason for its own existence and for everything else. However, there is no good reason to accept the principle of sufficient reason, and no good reason to suppose that even if there is a being that is the reason for its own existence, it would have to be God.

The Teleological (Design) Argument (see INTELLIGENT DESIGN THEORY). This argument also fails, since it at most proves the existence of a designer or designers and this is compatible with deism, polytheism, or a finite god. Let us consider first the version of William Paley, an eighteenth-century churchman. Paley's argument is an inductive argument from analogy. He maintained that since the universe is analogous to a machine and machines are created by intelligence, the universe is probably created by an intelligence. However, David HUME showed that if we take the analogy seriously, we are justified in drawing conclusions that are incompatible with traditional theism. For example, since in our experience a machine is created by many imperfect beings with bodies from preexisting material, we should infer that the universe was probably created by many imperfect beings with bodies from preexisting material. Hume's main point was that advocates of the teleological argument do not take seriously the *empirical* nature of the argument. We are justified only in inductively inferring from what is found in experience, and in terms of our experience we would have to infer that the creator is less than perfect. Hume did not say that experiences allow us to infer that the creator of the universe is totally evil, only that the creator is *less* than perfect. This inference is justified from our experience and is in conflict with Christian theism.

The fine-tuning version of the Teleological Argument, used by contemporary philosophers such as Richard Swinburne and Craig, maintains that there is an extremely large number of possible values for the physical constants in the universe, yet only a very narrow range of those possible values are compatible with human life; consequently, it is extremely improbable that human life occurred by chance. However, this fine-tuning argument is valid only if one makes the unjustified assumption that all possible values are equally probable. None of our current probability theories—classical, frequency, or propensity—can be applied to the beginning of the universe nonproblematically. Moreover, if human life in the universe is caused by design, why is it so rare and why did it arrive so late? As far as we know, human life exists now on only one insignificant planet and did not exist at all for about ten billion years.

The Ontological Argument. This argument, used by Saint Anselm and Descartes, represents an attempt to show that God—a perfect being, or a necessary being, or a being such that no greater being can be conceived—exists by definition. It has taken many different forms but all have proved to be unsound after examination. Moreover, even if the argument were sound, it would fall short of proving the existence of the theistic god, for the god of this argument need not be a person or reveal himself through miracles and scripture.

The Argument from Miracles (see MIRACLES, UNBELIEF IN; MIRACULOUS PHENOMENA). Many Catholic theologians attempt to argue from allegedly miraculous events such as the "cures" at Lourdes to the existence of God. However, this argument also fails to prove theism; at most it demonstrates a supernatural miracle worker or workers. Moreover, it assumes that there is evidence of miracles in the form of events that can never be explained by scientific theories. But we do not know of any such events. Alleged miracles such as Jesus's resurrection and the "cures" at Lourdes need strong evidence to be believed and this is lacking.

The Argument from Religious Experience. This argument, used by Richard Swinburne, provides no reason for belief in the theistic God, since there is no good reason to suppose that any religious experiences are veridical. Indeed, we know that some of them are not, since they conflict with those reported by others. In particular, there is no reason to suppose that religious experiences of a theistic God are veridical and that conflicting nontheistic religious experiences are not.

The Argument for Morality. The basic idea of the argument used by the English philosopher Hastings Rashdall is that because there is an absolute standard of morality, we must assume, or at least act as if, there is a being that provides this standard, namely, God. There are three main problems with this argument. First, it is simply assumed that there is an absolute standard and that if there were no standard, moral anarchy would reign. But a nonabsolute ethical standard need not entail moral anarchy: human beings can have good prudential reasons to create moral systems with prohibitions against murder, stealing, and so on. Second, absolute moral standards are compatible with atheism. Finally, it is doubtful that theism can provide any absolute moral standards in actual practice. Different theistic religions, for example, Christianity and Islam, are committed to conflicting absolute standards and there seems to be no objective way to reconcile them. Moreover, even within the same religious tradition, there are different interpretations of what one should do. For example, with respect to the death penalty, Christian thought ranges from advocating complete abolition to advocating the death penalty for homosexuality and for working on the Sabbath.

Pascal's Pragmatic Argument (see PASCAL'S WAGER). Pascal maintained that it was a good bet to believe in God: If one believes and God exists, one will

obtain heaven; but if one fails to believe and God exists, one goes to hell; but if God does not exist, one has gained little if one fails to believe and has lost little if one believes; hence, it is in one's interest to believe in God. This argument fails since it gives us no reason to believe in the theistic God rather than in other kinds. Moreover, it does not acknowledge that God may take a dim view of one's betting on his existence. In any case, pragmatic arguments at most show that it is useful to believe in God—not that the belief is true or probable.

Plantinga's Argument from Basic Belief. Alvin PLANTINGA has argued that the theistic belief in God is a properly "basic" belief. Like simple perceptual beliefs and simple mathematical beliefs, it is rationally held, yet not inferentially based on more basic beliefs. However, this analysis not only allows conflicting religious beliefs to be properly basic, but also provides no clear non-question-begging criteria for excluding astrological and magical beliefs as properly basic.

THE JUSTIFICATION OF POSITIVE ATHEISM

Although the above arguments do not exhaust all of the arguments for the existence of God, they do cover the most important ones. Thus, their failure does provide some grounds for negative atheism. However, are there any reasons to disbelieve in God? Let us consider some reasons.

The Argument from Incoherence (AFI). One good reason not to believe that God exists is that the concept of God is incoherent; that is, the concept of God is like that of a round square or the largest number. The AFI can be made in two ways: First, it can be shown that some of the properties attributed to God in the Bible are inconsistent. For example, God is said to be invisible (Col. 1:15, 1 Tim. 1:17, 6:16), a being that has never been seen (John 1:18, 1 John 4:12). Yet several people in the Bible report seeing God, among them Moses (Exod. 33:11, 23), Abraham, Isaac, and Jacob (Gen. 12:7, 26:2, Exod. 6:3). God is supposed to have said, "You cannot see my face, for no one can see me and live" (Gen. 32:30). However, Jacob saw God and lived (Gen. 32:30). In some places God is described as merciful and in other places as lacking mercy; in some places as a being who repents and changes his mind, in other places as a being who never repents and changes his mind; and in some places as a being who deceives and causes evil, and in other places as a being who never does; in some places as one who punishes children for their parents' wrongdoing and in other places as one who never does.

Second, AFI can also be made by showing that the attributes of omniscience, omnipotence, and divine freedom specified in philosophical accounts of God are either in conflict with one another or internally inconsistent. Consider some arguments connected with omniscience.

a. In one important sense, to say that God is omniscient is to say that God is all-knowing and to say that God is all-knowing entails that he has all the knowledge that there is. Now philosophers have usually distinguished three different kinds of knowledge: propositional, procedural, and knowledge by acquaintance. Briefly, propositional or factual knowledge is knowledge that something is the case and is analyzable as true belief of a certain kind. In contrast, procedural knowledge or knowledge *how* is a type of skill, and is not reducible to propositional knowledge. Finally, knowledge by acquaintance is direct acquaintance with some object, person, or phenomenon. For example, to say "I know Mr. Jones" implies that one has not only detailed propositional knowledge about Mr. Jones but direct acquaintance with Mr. Jones. Similarly, to say "I know poverty" implies that, besides detailed propositional knowledge of poverty, one has some direct experience of it.
b. To say that God is all-knowing, then, is to say that God has all knowledge where this includes propositional knowledge, procedural knowledge, and knowledge by acquaintance. However, the implications of this account for the existence of God have usually not been noticed. God's omniscience conflicts with his disembodiedness. If God were omniscient, then on this definition God would have all knowledge, including that of how to swim. Yet only a being with a body can have such knowledge in the procedural sense, that is, actually have the skill, and by definition God does not have a body. Therefore, God's attribute of being disembodied and his attribute of being omniscient are in conflict. Thus, if God is both omniscient and disembodied, God does not exist. Since God is both omniscient and disembodied, he does not exist.
c. The property of being all-knowing not only conflicts with the property of being disembodied, but also with certain moral attributes usually attributed to God. If God is omniscient, he has knowledge by acquaintance of all aspects of lust and envy. But one aspect of lust and envy is the feelings of lust and envy. However, part of the concept of God is that he is morally perfect and being morally perfect excludes these feelings. Consequently, there is a contradiction in the concept of God. God, because he is omniscient, must experience the feeling of lust and envy. But God, because he is morally perfect, is excluded from doing so. Consequently, God does not exist.
d. In addition, God's omniscience conflicts with God's omnipotence. Since God is omnipotent, he cannot experience fear, frustration, and despair. For in order to have these experiences, one must believe that one is limited in power. But since God is all-knowing and all-powerful, he knows that he is not limited in

power. Consequently, he cannot have complete knowledge by acquaintance of all aspects of fear, frustration, and despair. On the other hand, since God is omniscient, he must have this knowledge.

Various objections to these three arguments can, of course, be imagined. Although these objections can be met, it is useful here to mention the most commonly voiced criticism. The coherence of God is often defended on the grounds that God's knowledge should not include knowledge by acquaintance and all knowledge how but should be limited to factual knowledge. The trouble with this defense, however, is that it makes it logically impossible for God to have knowledge that humans have. This is paradoxical to say the least. One normally supposes that the following is true:

(1) If person P is omniscient, then P has knowledge that any nonomniscient being has.

Furthermore, one normally supposes that the following is true:

(2) If God exists, God has all knowledge that humans have.

But both (1) and (2) are false given the restriction of God's knowledge to factual knowledge. Furthermore, even if we restrict God's knowledge to propositional knowledge, the concept of God is still incoherent. Consider one argument that can be adduced to show that it is logically impossible for God to be omniscient in this sense.

If P were omniscient, then P would have knowledge of all facts about the world.

Let us call this totality of facts Y. So if P is omniscient, then P knows Y. One of the facts included in Y is that P is omniscient. But in order to know that P is omniscient, P would have to know something besides Y. P would have to know:

(Z) There are no facts unknown to P.

But how can Z be known? It can be argued that Z cannot be known since Z is an unrestricted negative existential statement. It can be admitted that it is possible to know the truth about those negative existential statements that are restricted temporally and spatially. But Z is a negative existential that is completely uncircumscribed. Knowing Z would be like knowing it is true that no centaurs exist anywhere at any time.

But why could not God with his infinite power search all of space and time and conclude that there are no centaurs? Similarly, why could not God search all space and time and conclude there is no more factual knowledge that he can acquire? This could be answered by saying that God could not exhaustively search space and time because they are both infinite. No matter how much God searched, there would be more space and time to search. Consequently, it is possible that there are facts he does not know. Thus, for God to know that he knows all the facts located in space and time is impossible, and since omniscience entails such knowledge, omniscience is impossible.

Now it may be objected that God will know Z because he is the sole creator of the totality of facts (other than himself). But this reply begs the question. How could God know that he is the sole creator of the totality of facts unless he also knows Z? But since Z cannot be known, God cannot know he is the sole creator of the totality of facts.

This reconstruction turns on the factual assumptions that space and time are infinite, but some scientists have claimed that space is finite but unbounded. The infinite nature of time is also controversial. At most, then, the argument proves that *if* space and time are infinite, *then* God is not omniscient. But since God is omniscient by definition, he cannot exist if space and time are infinite.

However, there is a realm that is uncontroversially infinite. If God were omniscient, he would know all mathematical facts and know that there are no mathematical facts that he did not know. In order to know all mathematical facts however, it would be necessary to investigate all mathematical entities and the relations between and among them. But the number of mathematical entities and relations is infinite. So even God could not complete such an investigation.

We can conclude, then, that given the existence of an infinite number of mathematical entities, God is not omniscient; hence, if omniscience is an attribute of God, he does not exist. Since omniscience is an attribute of God, he does not exist.

The Argument from Evil (AE) (see EVIL, PROBLEM OF). Another good reason to disbelieve in God is the existence of a large amount of evil in the world. How can a perfectly good and all-powerful being allow this evil? The simplest and most probable explanation of this evil is that God does not exist. With respect to moral evil—the evil brought about by human beings—the free-will defense (FWD) is used to overcome the difficulty. This is the familiar strategy of arguing that moral evil is not to be blamed on God, but is the result of humans' misuse of their free will. This defense is severely flawed.

a. The FWD presupposes contracausal freedom (CCF), the position that human decisions are not caused by any events in our brains or nervous systems. However, there is no scientific reason to suppose that CCF is true.
b. God could have created human beings with a tendency to do good. This would be compatible with CCF, and would have produced less evil.
c. God could have produced human beings with CCF

who would be less vulnerable to physical attack; for example, human beings with bulletproof skin.

d. God could have made natural laws in such a way that would have made it harder for human beings to inflict harm on one another; for example, laws that prevented the making of explosives. This also would have been compatible with CCF and would have prevented much evil.

e. There is a distinction between the decision D to do an act A, and the outcome O of A. God could have allowed people to exercise their CCF in D and yet have ameliorated the harmful outcome O by divine intervention.

f. The FWD assumes that the exercise of free will is worth the price of millions of deaths and untold suffering. This is a doubtful assumption.

g. Although God is not directly responsible for evil on the FWD defense, he is indirectly responsible. Presumably he has foreknowledge and knows that his creatures will misuse their CCF. In this case, God is reckless. Moreover, if he does not have foreknowledge, he knows at least that this misuse is possible and takes no safeguards to prevent it. In this case, God is negligent.

A variety of strategies have been proposed for solving the problem of natural evil—that is, evil not brought about by human action, for example, earthquakes, tidal waves, or severe mental retardation. For example, it might be suggested that natural evil is necessary for moral perfection, that demons cause natural evil, that natural evil is warning that greater evil will follow, and that evils such as the suffering of animals are necessary in the present state of the world. I am afraid that none of these suggestions will do.

a. Natural evil may be necessary in the present state of the world, but an all-powerful God need not be limited to this world, and is capable of actualizing a possible world with different laws, including a world where animals would not suffer.

b. The suggestion that demons cause natural evil simply assimilates the problem of natural evil to the problem of moral evil: it makes natural evil the result of the free will of demons. In this case, all of the problems of the FWD apply.

c. The suggestion that evil is a warning has at least two problems. First, it is difficult to see how evils such as genetic birth defects are a warning to the innocent children who have them, or even to the parents of the children who may have led morally upright lives. Second, an all-powerful God could warn people in ways that are not so destructive and that are less ambiguous. For example, he could speak to directly to them, or send heavenly messengers.

d. The idea that evil is necessary for moral perfection also has great problems. First, a flood or tidal wave that kills thousands of children is hardly building the character of these children. With respect to other people who survive, for example, the parents of the children, instead of strenthening their character, the trauma may just as well crush them beyond recovery. Second, an all-powerful God could have provided opportunities for moral development without causing so much pain and suffering, including the killing of the innocent.

The Argument from Nonbelief (ANB). Still another reason for disbelieving in God is the large number of disbelievers in the world. ANB is especially telling against evangelical Christianity, although it has some force against other religions, for example, Orthodox Judaism.

Evangelical Christianity is the view that (1) God is a merciful and all-loving God, compassionate and caring toward humanity, (2) the Bible and only the Bible is *the* source of God's word, (3) God wants all humans to be saved, and (4) a necessary condition for being saved is becoming aware of the word of God and accepting it. Supposing evangelical Christianity is true, it is difficult to understand why there are nearly one billion nonbelievers in world. How can a merciful God, a God who wants all humans to be saved, not provide clear and unambiguous information about his word to humans when having this information is necessary for salvation? Yet, as we know, countless millions of people down through history have not been exposed to the teaching of the Bible and those who have been exposed are often exposed in a superficial and cursory way, a way that is not conducive to acceptance. Even today there are millions of people who, through no fault of their own, either remain completely ignorant of the Christian message or, because of a serious lack in their education, reject it. One would expect that if God were rational, he would have arranged things in such a way that there would be more believers.

Here are a few obvious ideas about how this could have been done:

a. God could have made the Bible more plausible. He could have made it free from contradictions and factual errors. It could contain clear and unambiguous correct prophecies and no false and ambiguous ones.

b. God could have provided people with exposure to the Bible's message by having Bibles appear in every household in the world written in a language that the occupants could read.

c. God could have spoken from the heavens in all known languages so that no human could doubt his existence and his message.

d. God could have sent angels disguised as human preachers to spread his word and given them the power to perform unambiguous miracles and works of wonder.

e. God could have implanted belief of God and his message in every person's mind.

f. In recent times, God could have communicated with millions of people by interrupting prime-time TV programs and broadcasting his message.

These ideas and countless others would have increased the number of believers and presumably the number of saved people. Yet God has used none of them.

There are a number of defenses against ANB that I should briefly mention.

The Free Will Defense. Theists might argue that God wants his creatures to believe in God without any coercion. The above suggestions, it might be said, involve making people believe in God and this would interfere with their free will.

However, none of the above suggestions about how God could have increased people's belief in God interfere with their free will. For example, providing people with clear and unambiguous evidence of his existence hardly interferes with their free will, since they can reject this evidence. In fact, in the Bible God is said to have performed spectacular miracles that influenced people to believe in him. For example, in Exodus 7:5 God performed a miracle to demonstrate to the Israelites that he was the true God. Even if God implanted belief in God into people's minds, they could reject the implanted idea. Moreover, it makes no sense to suppose that a rational God would create human beings in his own image and yet expect them to believe in him without strong evidence; that is, to be irrational.

The Testing Defense. One defense that is used by evangelical Christians is that evidence for God is clear and unambiguous but humans have rejected it because of a spiritual defect such as false pride. Those who accept the evidence pass the test and those who don't fail the test.

However, there is no reason to suppose that evidence for God is convincing but that people reject it because of a spiritual defect. There is another, more plausible hypothesis: the evidence of God is utterly unconvincing. In addition, even if it were convincing, billions of people, because of their backgrounds or circumstances, have not been exposed to it. Moreover, if the Bible is convincing in principle and humans have been exposed to it, they may not see this because of faulty reasoning. It is grossly unfair to punish people for not believing in God either because they have not been exposed to his teachings or because of an error of reasoning.

The Unknown Purpose Defense. Theists might argue that God has some unknown reason for permitting so many nonbelievers. In reply to this defense one could argue that theists have the burden of proof of showing that there is an unknown purpose. First, God commanded all people to love him and to believe in his son. Second, the Bible says that the commandment to love God is the greatest of all commandments—not to be overridden by another. Third, Jesus said he came to the world to testify to the truth—the gospel message. Again his mission is presumably not to be overridden by other purposes. These reasons indicate that there is strong scriptural support for there being no unknown reason for the existence of so many nonbelievers.

In addition, God has further properties that make his having an unknown purpose for permitting so much nonbelief implausible. For example, according to evangelical Christianity, God wants humans who love him. Since loving him presupposes being aware of his message, how can he want this and yet fail to make billions of humans aware of the gospel message? The appeal to unknown purposes at worst makes God appear irrational and at best creates a mystery that detracts from the explanatory power of theism.

In addition to providing general arguments against the existence of God, atheists have also been critical of the historical evidence used to support the major theistic religions. For example, they have argued that a lack of good evidence casts doubt on doctrines of Christianity such as the Resurrection and the Virgin Birth. On the one hand, it is said that since these events are miracles, claims of their occurrence should be rejected unless there is extremely strong evidence to support them. On the other hand, it is held that the available evidence in their favor from biblical, pagan, and Jewish sources is weak.

Atheism versus Agnosticism

From the point of view of the world at large, atheism's greatest rival is theism, but from the point of view of the world of nonbelievers, its greatest rival is agnosticism (see Agnosticism; Agnosticism and Atheism). What can atheism say in its defense? First of all, the case for positive atheism presented above is indirectly a case against agnosticism. If one can show that there are good reasons to disbelieve in God, then agnosticism is indirectly refuted. However, agnostics have arguments for rejecting atheism that must be addressed.

Thomas Henry Huxley said that one should not pretend to conclusions one cannot demonstrate. Although Huxley did not actually do this, he might have gone on to say that atheists pretend to the conclusion that God does not exist, but cannot demonstrate it. There are some problems, however, with this sort of argument. To begin with, it begs the question by supposing that there are no atheistic arguments that demonstrate God's nonexistence. Furthermore, if by *demonstrate* one means a deductive proof or disproof of the kind found in mathematics, then science is at fault, for scientists accept conclusions they cannot demonstrate. Inductive reasoning does not yield demonstrative conclusions, and yet it is intellectually respectable.

A variation of this theme is that atheism is not justified since one cannot be certain that God does not exist. But stated more formally, the Argument from Certainty is: Since only certainty can justify disbelief in God, atheism

is not justified and agnosticism is justified. However, although some atheists claim to be certain that God does not exist, this is not essential to their position. For positive atheism to be rationally justified it is necessary only that either it be more probable than not or at least more probable than theism. Certainty is no more required in the case of atheism than it is in the case of scientific theories.

Another common argument agnostics adduce is that in claiming to have knowledge that God does not exist, atheists have transcended the limits of reason; hence, their conclusion is not acceptable. Moreover, the claim assumes what must be shown, in that atheists have claimed to show that one can have knowledge that God does not exist.

Another agnostic argument against atheism is that any atheist thinker knows that many theists who are intelligent enough to know all of the atheistic arguments against the existence of God reject them. Should not the existence of such theists cause atheists to reconsider their position? Indeed, should not their existence induce atheists to retreat to agnosticism? This argument is not, however, persuasive. First, the existence of such theists does not mean that agnosticism is justified. Intelligent and knowledgeable theists might induce atheists to reexamine their arguments, but if, on careful examination, the atheistic arguments hold up to criticisms, atheists are justified in maintaining their position. Second, this argument proves too much. After all, intelligent and even brilliant scientists who know the arguments of their critics have held all manner of crank and outlandish theories. This argument would have the absurd implication that other scientists should be agnostic with respect to these theories.

Another argument for agnosticism starts from the premise that one can look at atheism from an external point of view and try to determine the causal factors that bring about atheism and the acceptance of the arguments that are used to justify it. Viewed in this way, atheistic beliefs, values, and attitudes are dependent on social, historical, and psychological factors. Thus, for example, if the present writer had been raised in a strict fundamentalist home, he might not have accepted the atheistic argument that he readily accepts today. Thus, the fact that he is an atheist today rather than a theist is a matter of luck or accident, in that is depends on where he was born and on other early influences. Given this insight, one might argue that the only rational stance to take is agnosticism, a position that avoids the possible biases of the accidents of birth.

The first problem with this argument is that if it were taken seriously it would generate widespread skepticism in all fields, including science. For example, there are usually conflicting theories in physics. On this view whether a person accepts one theory of physics rather than an alternative will depend on historical, social, and psychological factors. But surely it is absurd to suppose that agnosticism in relation to these theories is always justified. Sometimes the evidence for one theory is so much stronger than it is for any of its rivals that it justifies belief in one theory and rejection of its rivals. Second, agnosticism is no less dependent than atheism on social, historical, and psychological factors. One might argue that had Thomas Huxley been born in different circumstances, his famous essay on agnosticism would never have been written. Does this mean that we should neither believe nor disbelieve the major theses of his essay? It is also worth noting that not all atheists are born into atheistic families. Many atheists are former religious believers who have somehow transcended their religious heritage. To be sure, the fact that what we believe about the existence of God is partly a function of our social, historical, and psychological background should alert us to possible biases and induce us to review our arguments. Nevertheless, after careful review we may justifiably decide that our arguments hold.

Yet another agnostic claim is that atheism is a dogmatic view characterized by an authoritative, arrogant assertion of unproved or unprovable principles. It is maintained that since such dogmatic views should be avoided, atheism should be as well. In contrast, agnosticism is characterized as being tentative, flexible, and open-minded. Since these characteristics are to be encouraged, agnosticism is to be preferred to atheism. However although there have been dogmatic atheists, there is no necessary connection between atheism and dogmatism. Atheists can be tentative, flexible, and open-minded in their position, willing to consider objections to their arguments and to give up their views in the light of new evidence. On the other hand, agnostics can stubbornly cling to their rejection of atheism in spite of strong evidence to the contrary, unreasonably sticking to their claim that there is no good evidence for disbelief.

Finally, many appear to advocate agnosticism instead of atheism because of atheism's "bad name." They believe it is bad public relations to bill oneself as an atheist, since people tend to reject the views of an avowed atheist out of hand. They say that in order to get one's views accepted, one should advocate the less controversial and more socially acceptable label "agnostic" over the more controversial and less socially acceptable label "atheist."

However, although this may be a good argument for pretending to be an agnostic, it is not a good argument for actually being one. In fact, if pushed to its logical conclusion, it would justify pretending to be a theist. After all, although agnostics may have better reputations than atheists, they do not have as good reputations as theists. It has been said that in the United States a professed atheist could never be elected president. But could a professed agnostic?

AUSTRALIA, UNBELIEF IN. As is seen with other social trends, belief and unbelief in Australia display characteristics of both their British and their American counterparts.

Australia has inherited most British religious and irreligious institutions and attitudes. Nominal Christian belief has passed from the Church of England (now Anglican) leavened with Nonconformism (that is, non-Anglican Protestantism) to a situation where Roman Catholic Church membership approximately equals the population of Anglicans plus members of the Uniting Church (Methodist, Congregationalist, and ecumenical Presbyterian). Meanwhile the targets of campaigning unbelievers have changed to address the theological and social claims of whichever denomination has appeared most threatening at the time. Latterly, concern has extended to fundamentalist Islam. Britain has inspired freethought labels from SECULARISM (curiously blended with Spiritualism) to RATIONALISM to HUMANISM; but whereas the first is still prominent in Britain, it has all but vanished in Australia. Yet demands for secularity and the spontaneous growth of secularization are common to both countries (see SECULARISM; DEMOGRAPHY OF UNBELIEF). Politically, Australia and Britain share the same monarch as head of state, a republican tradition opposed to that monarchy, and the Westminster system of choosing members of the lower house of Parliament and the executive government.

In other respects, Australia has followed the United States. Both have long been immigrant countries facing the challenge of multiculturalism; both have known slavery and quasi slavery (in northeast Australia, Pacific Islanders); both are federations with a state-based upper house of the legislature and a written secular constitution. Yet whereas the United States has upheld its secularity more conscientiously, it is paradoxically better noted for public and private piety. Most Americans patronize church, chapel, mosque, temple, or synagogue, while many unbelievers may see a sociopolitical need to embrace UNITARIAN UNIVERSALISM (see DEMOGRAPHY OF UNBELIEF). In Australia, God is rarely invoked by politicians save in opening Parliament, and in the 2001 census 15.3 percent of Australians claimed "no religion" while 9.7 percent declined to state a religion.

HISTORY OF AUSTRALIAN UNBELIEF

As each Australian state has a different educational and legal system, so each (apart from unorganized Tasmania) has fostered separate freethought organizations to respond to local challenges, though federal coalitions may exist to coordinate campaigns of national interest. Australia's small population and vast area, plus the traditional independence of freethinkers, have combined to keep these bodies small and often ineffective, factionalized, and evanescent. Freethought within religious denominations has largely arisen spontaneously to produce "lapsed" believers rather than active unbelievers.

The greatest lapsing has occurred in the indigenous animistic faith, which had lasted for around fifty thousand years before the white occupation. Aboriginal belief systems varied in detail from place to place in a vast continent with little precontact communication, but essentially involved black and white magic performed by a *kurdaitcha* man (witch doctor), and beliefs in Dreamtime ancestors, animals, and spirits with supernatural powers to shape the landscape and tribal lore. Then Christians—chiefly Catholic, Lutheran, Uniting Church, and Seventh-Day Adventist—established missions to eradicate "primitive" Aboriginal beliefs. Secularization virtually completed the process, though freethought bodies have been in the forefront of support for the maintenance of Aboriginal identity and land rights and for Aboriginal reconciliation with the nonindigenous population. While traditional stories are perpetuated in Aboriginal art and dance, all but a few remote tribal elders regard them as that: just stories.

Australia's first white settlers, the 1788 "First Fleeters"—overwhelmingly convicts and soldiers sent from Britain to serve out their time—often displayed the rootlessness, licentiousness, and simulated piety usually associated with such groups. This mix of rebelliousness and authoritarianism within a governmental framework of social conservatism and cultural cringe toward the "Mother Country" survived largely intact for 180 years, though the arrival of Irish political prisoners from the end of the eighteenth century brought people with deep religious or nonreligious views. After 1840 almost all arrivals were free settlers with their own religious and other traditions but a strong, if declining, desire to fit into the prevailing ethos. Nevertheless, freed from entrenched class systems in their countries of origin and

fortified by geographical isolation, they made Australia (together with New Zealand) a pioneer in civil liberties.

Nineteenth Century. Throughout the nineteenth century, the leading freethinkers in Australia were English immigrants of Protestant derivation; often they originally intended careers in the ministry. To earn a living lecturing, especially during economic depressions, they were forced to travel throughout the six Australian colonies and New Zealand, though they preferred to keep one city as a base. There they often established their own newspaper or magazine, however short-lived. Disputes over the need for militancy, or AGNOSTICISM versus ATHEISM, were fewer than in the United Kingdom, and the major confrontation was between PHILOSOPHICAL MATERIALISM and Spiritualism (see SPIRITUALISM AND UNBELIEF). The first notable unbelieving settler was Charles SOUTHWELL. Maneuvered out of a legacy and secularist prominence in England by George Jacob HOLYOAKE, he settled in Melbourne in 1855, then New Zealand in 1856.

The earliest freethought society known in Australia was established in Newcastle, New South Wales, in 1862, with the Chartist Daniel Wallwork becoming its secretary in 1865. In Melborne, W. H. Terry founded the *Harbinger of Light* in 1870 and became treasurer of the Victorian Association of Progressive Spiritualists in 1872. In 1871 William Lorando Jones was convicted of BLASPHEMY in Sydney and sentenced to two years in jail and fined for saying the Bible was immoral, but a public protest secured his release on bond. By 1874 Melbourne had a Progressive Lyceum and a Free Discussion Society, Brisbane a Freethought Association, and Sydney a Freethought Progressive Society. Six years later Sydney had a Progressive Secular Lyceum for secularists and spiritualists under Ebenezer Skinner. All the leading freethought lecturers of the 1870s—John Tyerman, Thomas WALKER, Dr. James Peebles, Mrs. Emma Hardinge Britten, and Charles Bright—were spiritualists, and the *Harbinger* solemnly recorded all supposed "manifestations" from the spirit world. Walker began his Australian career in Sydney in 1877 allegedly "controlled" by four spirit guides, including Giordano BRUNO, but abandoned them and went to wealthier Melbourne, where he tried to secularize its lyceum, which had fallen under the control of Spiritualists.

Faced with emergent SKEPTICISM, the spiritualists formed the Liberal Association of New South Wales in 1881 to fuse religious and atheistic thought into one "party of progress," but the secularists soon bridled at Spiritualism's dominance. In 1882 Walker and others launched in Melbourne the Australasian Secular Association (theoretically embracing New Zealand), with the *Reformer* as its journal; but when Terry revealed his Canadian past (see WALKER, THOMAS) he left Melbourne to become president of the Sydney branch of the Australasian Secular Association. To take his place in Melbourne, the Australasian Secular Association requested a lecturer from England. Disappointed that Edward B. AVELING and not himself had taken the place of the jailed George William FOOTE as editor of the British magazine the *FREETHINKER*, Joseph SYMES came to Melbourne with Charles BRADLAUGH's blessing in 1884. He was soon joined by William Willis, who later established a freethought bookstore in Sydney. An Australasian Freethought Conference there inspired the formation of freethought societies in South Australia and major country centers. Symes became president of the parent Australasian Secular Association, with Bright and Walker as vice presidents, and established the republican and atheistic *LIBERATOR: A Weekly Radical Freethought Paper.* Also in 1884 the *Liberal*, edited by Bright, was established in Sydney, and a short-lived *Young Secularist* in Melbourne. An Australasian Freethought Union was formed in Sydney; its radical secularist agenda served as a counterweight to the Australasian Secular Association.

In 1885 Walker resigned his presidency and was expelled from the Australasian Secular Association's Sydney branch, but became president and lecturer of the Australasian Freethought Union and editor of its *Reflector.* The Australasian Secular Association sent another call to England for a Sydney lecturer, and received William Whitehouse COLLINS. Collins founded and edited the *Freethinker and New South Wales Reformer*, which soon merged with the *Liberator.*

In 1886 Sir Alfred Stephens introduced into the New South Wales Legislative Assembly a liberal divorce-extension bill, which finally passed in 1887 with the support of Walker, then a member of the legislative assembly. The editor of the *Australian Christian World* asked the premier of New South Wales, Sir Henry Parkes, to ban Symes's *Ancient and Modern Phallic or Sex-Worship* (1886) for "blasphemy and obscenity." Instead, Parkes stopped Sunday lecturing in Sydney theaters. Collins was unsuccessfully prosecuted for selling Annie BESANT's contraceptive tract *Law of Population* (1877); deprived of his main income source, he went to Brisbane.

In Melbourne, some Australasian Secular Association executive members accused Symes of autocracy, while others were shocked by his writing on phallic worship. Yet others abandoned his Bradlaughite liberalism for emerging MARXISM or anarchism (see ANARCHISM AND UNBELIEF). Symes called a "showdown" meeting at which, he asserted, the other association officers (who were also trustees of assets) were dismissed and new ones elected. The trustees claimed they had walked out and the elections were invalid. On Australasian Secular Association land, Symes built a Hall of Science that opened in 1889; he ran unsuccessfully for Parliament. In Sydney an Australasian Secular Friendly Benevolent Society was formed; Collins established *Freedom* and laid the foundation stone for a new Sydney Lyceum before leaving on a lecture tour of New Zealand, and settling there till 1917.

Throughout Australia, secularists were so successful in flouting Sunday observance laws with their paid-admission lecture events that museums, art galleries, libraries, excursions, and other entertainments were eventually permitted to operate on the Sabbath. Unfortunately for the secularists, these provided competition for their lectures. In the 1890s the situation worsened with a depression which caused unemployment for the artisans and bankruptcies for the small businessmen on whom the secularist movement depended. Many went to remote mining centers in New South Wales and Western Australia looking for work.

In 1890, members of an anarchist anti-Symes faction invaded his hall but were driven back by supporters led by its socialist caretaker, Joseph Skurrie. The following year, Australasian Secular Association trustees obtained a court order for possession of the hall Symes had erected on their land. Symes was forced to lecture in a city theater; Skurrie to become an itinerant lecturer, then a miner; Walker, after a shooting incident, to leave the parliament of New South Wales and become a temperance lecturer. Symes again ran unsuccessfully for Parliament in 1892; Skurrie was fined for obstruction, profanity, and trespass in 1893; and Willis went to Tasmania in 1894, but died suddenly. Though closure of the impoverished *Liberator* was announced that year, Symes kept it alive for ten years with help from his second wife, Agnes Wilson SYMES. Sentenced to jail for criticizing a jury appointment, Symes resigned as president and trustee of his rival Australasian Secular Association in 1895, formed the Melbourne Freethought Society in 1897, bought back the old hall, and renamed it Freethought Hall.

Twentieth Century. Becoming law at the beginning of the new century, the flawed Australian Constitution gave the Commonwealth Government powers over trade, commerce, and the mails. Under enabling acts, these facilitated censorship of blasphemous, indecent, obscene, or immoral material, including advertisements relating to pregnancy, impotence, venereal disease, or abortion. It was the launch of Australian "wowserism" (WOWSER: We Only Want Social Evils Rectified). But section 116 of the constitution stated: "The Commonwealth shall not make any law for establishing any religion, or for imposing any religious observance, or for prohibiting the free exercise of any religion." Symes was only one observer to note the implicit contradiction.

Having failed to convert the Melbourne Freethought Society into an Australasian one, Symes retired in 1904. Harry Scott BENNETT, the first notable Australian-born freethinker, served one term in Victoria's legislative assembly and in 1907 began lecturing for the Victorian Socialist Party, which Symes had blamed for the "White Australia" policy implicit in the 1901 Immigration Restriction Act.

Under the banner of secularism or freethought, organized unbelief had grown moribund. It took RATIONALISM to breathe new life into it. In 1899 some National Secular Society dissidents and academic freethinkers formed the RATIONALIST PRESS ASSOCIATION (RPA) in London to bring classics of unbelief to a wider public. It soon attracted a significant overseas membership, which coalesced to form local associations and from which the RPA selected honorary local secretaries. In Australia rationalist associations appeared in Melbourne (1906), Sydney (1910), Brisbane (1914), and Perth and Adelaide (1918). The best-known figures were businessman William John Miles, New South Wales secretary from 1913, and H. A. Layman, director of the Queensland Museum and founding president of the Queensland rationalist society. Visits by English ex-priest Joseph MCCABE in 1910 and 1913 boosted these groups.

During World War I, three unbelievers—the socialist suffragette Adele Pankhurst, Dr. Vida Goldstein, and Celia Johns—formed the Women's Peace Army to fight conscription. In 1915 Skurrie returned to Melbourne and a fine and jail for saying that no thinking man would enlist. Robert S. Ross, leader of the Victorian Socialist Party, began *Ross's Magazine of Protest Personality and Progress*, supported by Miles, to oppose the war. It was prosecuted for blasphemy and confiscated in 1916 for printing an abstract of Skurrie's lecture "Gods, Ghosts, and Devils." Prime Minister William Morris (Billy) Hughes, an atheist, sponsored unsuccessful referenda on conscription in 1916 and 1917 and was expelled from the Australian Labor Party, but continued in office till 1923. Miles tried unsuccessfully to establish an Advance Australia League with the slogan "Australia First."

The first president of the Western Australian Rationalist Association (WARA) in Perth was Walker, who finally gained stability in the west as a goldfields journalist, newspaper proprietor, farmer, lawyer, legislative assembly member, and cabinet minister. John Samuel Langley was the association's secretary. When Melbourne industrialist Walter D. Cookes visited Perth, he persuaded Langley to return with him to Melbourne in 1919 to lead a Rationalist Society of Australia. Presently it became the Rationalist Association of Victoria and, in 1923, the Rationalist Association of Australia, with its publication the *Rationalist.* Two years later, to protect a bequest the Rationalist Association of Australia had received, a holding company was formed, the Rationalist Association of Australia Ltd. The Rationalist Association of Australia's assets and five members, who became directors, were transferred to the Rationalist Association of Australia Ltd. For the other Rationalist Association of Australia members and new recruits, a propagandist Rationalist Society of Australia was formed in 1926. Langley was secretary and lawyer Alfred Foster was chairman/president of both new bodies, which attracted the support of leading Melbourne writers, scientists, and judges.

Meanwhile, in Sydney two short-lived *Liberators* (1918 and 1923) were formed and Miles, believing McCabe was a British secret agent, quarreled with the

RPA and retired as secretary of the Rationalist Association of New South Wales. In 1930 the Sydney University Society for Freethought was formed by John ANDERSON, a Scottish immigrant, disillusioned Marxist, and Australia's most influential professor of philosophy. In 1931 he said that "State, Nation, King and Country, and loyalty" were superstitious terms appealing to prejudice, and incurred criticism in New South Wales's legislative assembly and censure by the university senate. Having retired from business, Miles began the *Independent Sydney Secularist* (1935) and, with the help of Queensland atheist writer Percy Reginald (Inky) Stephensen, the *Publicist: The Paper Loyal to Australia First* (1936). Though right-wing and chauvinistic, this paper was promonarchy. As Melbourne abounded in freethinking socialist lecturers, with Langley's blessing and financial aid Scott Bennett came to Sydney as secretary-lecturer of the Rationalist Association of New South Wales.

Moderately left-wing, Langley objected to Cookes's distributing Australia First literature on rationalist premises, and to the undemocratic nature of the Rationalist Association of Australia Ltd. Cookes, Foster, and most of the other directors (now eleven in total) objected to Langley's administrative inefficiency, extravagance, and autocracy, wrongly accused him of alcoholism, and expelled him in 1938. As with Symes, Skurrie supported Langley in his unsuccessful legal action for reinstatement. Langley retained support from the Rationalist Society of Australia, but when the Rationalist Association of Australia Ltd. formed a new Rationalist Society of Australia with W. Glanville Cook as secretary and *Rationalist* editor, Langley was legally forced to change its name to Freethought Society of Australia.

During World War II Stephensen became founding president of the Australia First Movement (1941). Criticizing the timing, Miles did not join. In 1942 Laurence Frederick Bullock and three other Perth members called for "a negotiated peace with the Japanese" and announced an alternative, pro-Japanese Australian government and a "liquidation" list of officials who had taken a hard line on Japan. Despite claiming these proclamations were drunken jokes, two members were jailed for conspiracy under the broadly written Crimes Act. Totally unaware of the Perth initiative, Stephensen, Pankhurst, and other eastern members were interned for various periods. In 1943 Anderson declared that religious doctrines assaulted a child's common sense and was denounced in the New South Wales parliament, but the university senate this time upheld academic freedom.

After the war a mild form of McCarthyism under Catholic auspices flourished. Claiming the trade unions and Australian Labor Party were communist dominated, lawyer B. A. Santamaria and Melbourne archbishop Daniel Mannix formed cells of the Movement, a Catholic group, inside both, and then established the Democratic Labor Party (1956). This attracted some non-Catholic supporters and kept conservative parties in power till 1972. Reactively, most freethinkers gravitated toward the Australian Labor Party.

With the death of Scott Bennett in 1959, the heyday of New South Wales rationalism ceased. As well as disdaining open-air "Bible-bashing," many Sydney freethinkers deemed the Rationalist Association of New South Wales Marxist dominated and in 1960 formed the New South Wales Humanist Society with its publication *Viewpoints* (1963), under William and Daphne Weeks. It published a number of tracts on civil liberties and BIOETHICS, and spawned a Secular Education Defense Committee (1962), a Council for Civil Liberties (1963), and an Abortion Law Reform Association (1969). Humanist societies were soon formed in other states: Victoria, with its publication *Victorian Humanist*, under Clive Sandy and Myfanwy M. Beadnell (1961); South Australia under Bruce Muirden (1962); Canberra (1964); Queensland, with its publication *Queensland Humanist*, under Tup and Margaret Baxendell (1964); and Western Australia (1965). The Council of Australian Humanist Societies was formed under Ian Edwards in 1965, and *Australian Humanist* became its organ.

In most Australian states a weakened rationalist association, with *Rationalist News* in New South Wales, survived; but in Queensland it was taken over. After internment in South Australia, Bullock revived the South Australian Rationalist Association in 1968. In 1970, inspired by the Indian atheist activist GORA, Bullock transformed it into the Atheist Foundation of Australia, with its publication *Australian Atheist*. An offshoot Atheist Association, with its *Atheist Journal*, then emerged under Frederick Swann, Bullock, and Alan Rickard. A Freethinkers Association of New South Wales under Charles King (1973) and a Victorian Secular Society under Harry H. Pearce and Nigel Sinnott (1978) came and went, but the Australian Skeptics with their journal *Skeptic* came into being under controversial solicitor Mark Plummer (1981) and continues to flourish under Barry Williams.

In recent decades unbelievers in Australia have been active but unsuccessful in defending its secular constitution as state aid to church schools mushrooms under all governments, as religion and CREATIONISM creep into state schools, and as medical and social services are outsourced to "faith" institutions. The Council for the Defense of Government Schools challenged state aid to religious schools in 1973, but lost in the High Court in 1981. A new challenge is being considered. In 1997 the Northern Territory parliament passed a voluntary euthanasia act, which the commonwealth vetoed; today humanist Dr. Philip Nitschke offers practical advice to those wishing to end lives shadowed by terminal disease. Faced with declining support and impact, the Rationalist Association of New South Wales contemplated merger with the the Humanist Society of New South Wales in 2006 to form the Humanist and Rationalist Association of New South Wales.

DAVID TRIBE

AVELING, EDWARD BIBBINS (1849–1898). English author and lecturer. Despite great talent and literary output, he is recalled negatively: unoriginal, unstable, and unprincipled.

Son of Congregationalist minister Thomas Aveling, Edward was born in Stoke Newington, London, on November 29, 1849. Educated in Taunton, he enrolled as a medical student at University College, London, but switched to science, graduating with honors in zoology (1870). After a stint as physiology assistant at Cambridge University he returned to London to marry heiress Isabel Frank in July 1872, but they separated after two years of high living. From 1872 to 1876 he taught physics and botany at a girls' school, then gained a doctorate, a fellowship in the Linnean Society, and a lectureship in comparative anatomy at London Hospital.

While lecturing at the City of London College in 1879, he met Annie BESANT and began writing pseudonymously for Charles BRADLAUGH's *NATIONAL REFORMER*. In July of that year he publicly revealed himself and abandoned his application for a professorship at University College. Claiming he had also lost his lectures at City of London College, he persuaded Bradlaugh to let him create formal classes under official Science and Art Department auspices at the NATIONAL SECULAR SOCIETY's Hall of Science. There he successfully taught botany, Latin, chemistry, mathematics, French, and advanced science, which he also wrote about in *The Student's Darwin* (1881) and other textbooks. Now a National Secular Society (NSS) vice president and a Bradlaugh lieutenant, he edited the *FREETHINKER* and *Progress* in 1983–84 while George W. FOOTE was in jail. Meanwhile, he was elected to the London School Board and joined H. M. Hyndman's (Social) Democratic Federation (SDF). Because of numerous unpaid debts and philanderings Bradlaugh forced him to resign from the NSS and return Besant's love letters.

By 1884 he had begun living with Eleanor Marx, Karl MARX's daughter; he abandoned the SDF for the Socialist League, which he left in 1885. After an extravagant lecture tour of North America in 1886, he promoted the "new unionism," the eight-hour workday, and the International Labor League. He was the first to publish Marx's *Kapital* (1867) in English (1887) and he also published *The Student's Marx* (1892), an influential text of the day. He joined the Independent Labor Party in 1893 but was expelled in 1894. From 1885 to 1896 he was also involved with the theater as drama critic, playwright, actor, and producer. In 1897 he secretly married actress Eva Frye and left Eleanor, but, ill and cash-strapped, rejoined her. In 1898 she committed suicide, and he died in Battersea on August 2.

DAVID TRIBE

AVERRÖES (Ibn Rushd; 1126–1198), Muslim philosopher and commentator. Abu al-Walid Muhammad bin Ahmad ibn Rushd, originally known in the West as Averröes, came from a family of jurists. Trained in the legal sciences, he served as a judge in Seville and Cordoba, Spain. He also studied medicine and philosophy, and is considered one of the greatest commentators on ARISTOTLE. His philosophical and religious views are the subject of furious debate among specialists; the nonspecialist should tread with care. No area of his thought is more sharply contested than his actual position on the relation between philosophy and religion.

Averröes may be most important as one of the conduits through whom ancient Greek and Hindu learning preserved during the Islamic Renaissance (eighth to tenth centuries CE) was retransmitted to the West, shaping the growth of science and philosophy during Europe's Renaissance. To better appreciate his role—and the context in which he is often misinterpreted—it is appropriate to review the process by which ancient learning was acquired, and to a limited degree resynthesized, by Muslim intellectuals.

Greek Philosophy and Science and Their Influence on Islam. The many words of Arabic origin that have entered European philosophy, science, and mathematics reveal the extent to which Islamic civilization influenced later European thought. This Islamic learning was founded on the works of the ancient Greeks, and the Muslims are important as the preservers and transmitters of ancient learning that might otherwise have been lost. Although Islamic thinkers seldom improved substantially on the works of the Greeks, they did make original contributions to trigonometry, for example, inventing

plane and spherical trigonometry, which did not exist among the Greeks. Islamic work on alchemy, magic, and astrology also played an important part in the development of European science—the idea of power over nature stimulated research and experimentation.

The period during which the heritage of classical antiquity was assimilated into Islam is known as the Islamic Renaissance. As the scholar F. R. Rosenthal forthrightly reminds us: "Islamic rational scholarship, which we have mainly in mind when we speak of the greatness of Muslim civilisation, depends in its entirety on classical antiquity, down to such fundamental factors as the elementary principles of scholarly and scientific research. More than that, the intellectual life of Islam in its most intimate expressions bowed to the Greek spirit."

To study this assimilative process is to confront the seeming oxymoron of Islamic philosophy. For to many Western scholars, and more importantly, to many Muslims, the very idea of "Islamic philosophy" is a contradiction in terms. Surely orthodox Sunni Islam never welcomed philosophic thought. Traditionalists denounced philosophy as a "foreign science," which they claimed must lead to heresy, doubt, and total unbelief. In this, traditionalist fears were well founded, for many Islamic philosophers developed views that were far from orthodox, while others, especially those hostile to the rising Sunni hierarchy, openly embraced the unfettered guidance of REASON as understood in Greek philosophy, offering but lip service to their religion. Thus the story of Islamic philosophy is, in part, the story of the tension between reason and revelation.

Although translation of Greek works may well have started in the seventh century under the first caliphate dynasty, the Umayyads, it was a caliph of the succeeding dynasty, the Abbasid al-Mamun (ruled 813–833), who strongly encouraged the translation of Greek philosophy and science. Al-Mamun went so far as to establish an institution called the House of Wisdom as a center for research and translation. The initial impulse for translating ancient works was practical—the need for medical and astronomical knowledge. But prestige and, later, genuine intellectual curiosity also played a part in what became a feverish activity.

The Greek philosophers translated included ARISTOTLE and his commentators such as Themistius, Simplicius, and Alexander of Aphrodisias; PLATO, particularly the *Timaeus*, *Republic*, and *Laws*; Plotinus and Neoplatonists such as Proclus and Porphyry; pre-Socratics; Galen, Hippocrates, Archimedes, Euclid, and Ptolemy.

The West's Discovery of Averröes. The first period of Islamic philosophy took shape in the East between the ninth and eleventh centuries with al-Kindi, al-Farabi, and Ibn Sina (Avicenna). It was this deposit of ancient learning that Averröes would play a special role in retransmitting to Europe, in the process inspiring widely divergent perceptions as to his own views.

First to present Averröes to the Christian West was Michael Scott, who under the patronage of the House of Hohenstaufen began around 1230–40 a Latin translation of the Arabic text of Averröes. The commentaries of Averröes were first translated into Hebrew by a group led by Jacob ben Abba Mari Anatoli of Naples in 1232. The scholars Augustinus Niphus and Marc-Antonio Zimara made some improvements in these translations. Newer translations based on the Hebrew text would later be made by Jacob Mantino of Tortosa. The two best Latin editions of Averröes are those of Niphus (1495–97) and of the Juntas (1553).

Averröes and His Modern Interpreters. The French biblical scholar Ernest RENAN viewed Averröes as a supreme rationalist (see RATIONALISM) opposed to all religious dogmas, who used his theological writings as smokescreens to hide his true views from the intolerant orthodox doctors of law. Twentieth-century scholars preferred to call him by his Arabic name, Ibn Rushd, and they have rejected this view of him as a clandestine soldier of the Enlightenment. Today Ibn Rushd is more often seen as a sincere Muslim, convinced that philosophy and revelation were both true.

Nor do modern scholars accept the idea that Ibn Rushd propounded the theory of "double truth"—the teaching that there exists one (usually religious) truth for the uneducated masses and another, less superstitious truth for the cultured few. For Ibn Rushd, there existed a religious truth that is true for all persons regardless of their education, status, or level of understanding. But he wrote that the sharia (Islamic law) commands the study of philosophy only for those capable of understanding and using Aristotle's demonstrative method. He held that the Qur'an contains passages that require interpretation, but this should only be attempted by those with a solid grounding in scholarship. Other parts of the Qur'an, as well as other texts that form a part of the sharia, must be taken literally. To interpret them would amount to unbelief and heretical innovations.

Western scholars also differ regarding Ibn Rushd's views on the resurrection of the dead. Over his productive life he seems genuinely to have changed his mind, or at least refined his theory. De Boer thought Ibn Rushd believed in the "perishable nature of all that is individual, by which theory individual immortality is also taken away," whereas George Hourani attributed to Ibn Rushd the view that "our physical bodies are dissolved at death, but we may receive new celestial ones in a resurrection, and these would hold our reconstituted individual souls." Meanwhile, Marmura holds that in his technical writings, such as his commentaries on Aristotle, Ibn Rushd's thought left no room for the immortality of individual souls. Yet in his other writings, Ibn Rushd "affirms a doctrine of individual immortality, whether this is confined to the soul or involves bodily resurrection." And in yet another work, Ibn Rushd affirms a doctrine of bodily resurrection. For Fakhry, Ibn Rushd's theory entails that "the only form of survival possible is intellectual, i.e., that of the material or

'possible' intellect, once it is reunited with the active intellect," Hourani, Marmura, and de Boer seem to agree that Ibn Rushd's theory would not have been acceptable to the orthodox clergy; Mamura even goes back to a Renan-like hypothesis, claiming that Ibn Rushd may have sought to protect himself against charges of unbelief in presenting different arguments to different audiences.

On another important issue, the position of women in Islam, Ibn Rushd's opinion must have driven the orthodox to fury: as interpreted by De Boer, he wrote that much of the poverty and distress of his day arose from the fact that women are kept like "domestic animals or house plants for purposes of gratification, of a very questionable character besides, instead of being allowed to take part in the production of material and intellectual wealth, and in the preservation of the same."

The Impact of His Thought. Averröes, as he became known, exerted profound influence on the Latin philosophers and scientists of the thirteenth century. A school of Averroists arose at the University of Padua, among whom Averröes's work on Aristotle sparked the very development of the inductive, empirical sciences.

Despite the almost incalculable importance of Averröes for Western learning, Ibn Rushd would have no influence whatever on the development of Islamic philosophy. After his death, he was practically forgotten in the Islamic world. Philosophy itself went into a decline within Islam, which came under the domination of Ash'arism, with its attendant petrifying dogma. There was a rather misguided attempt by the early twentieth-century Islamic renaissance movement, the Nahda, to take Averröes on board as an out-and-out rationalist who advocated a secular state. The movement was much influenced by Renan's interpretation of Averröes, an interpretation that overemphasized Averröes's rationality and belittled his religious and juridical work.

AYER, ALFRED JULES (1910–1989), English philosopher. A. J. Ayer was born in London on October 29, 1910, into a well-connected family with a continental past, went to the great private school Eton and then to Oxford, wrote the book *Language, Truth and Logic* when he was twenty-four, and won celebrity and some notoriety for it. After serving in World War II as an intelligence officer, he became the Grote Professor of the Philosophy of Mind and Logic at University College London, and then the Wykeham Professor of Logic at Oxford. He was known as England's logical positivist for his youthful work.

Ayer was a dutiful teacher, and in philosophical discussions he invigorated and indeed inspired students and younger colleagues. As a result of numerous broadcasts on the BBC he became the best known of British philosophers, and was knighted.

More than any of that, Ayer was the greatest of the twentieth-century philosophers who definitely fit into the tradition established by David HUME in the eighteenth century, perhaps the greatest of philosophical traditions. Ayer was the antithesis of the philosopher of mystery and intimation, and his work was refreshingly free of technicality.

He lived assertively and was vain and cocksure—at some cost to his philosophical reputation, since other philosophers were no less human in their judgments on him. He was also honest, humane, and more or less on the Left in politics. He enjoyed society, was a man of many women, came to be self-judging, and after some sadness died bravely on June 27, 1989. He lived and died an atheist (see ATHEISM).

If Ayer's connection to Hume is a matter of more than one fact, the heart of *Language, Truth and Logic*, no doubt the best-known expression of logical positivism, is a proposal with an antecedent in the resolute and resonant words of Hume. It gives philosophical expression to a hardheadedness and SKEPTICISM that also turn up elsewhere, certainly in much science and common sense.

The verification principle (see VERIFICATIONISM), the foundation of logical positivism, contends that any statement that is true or false must either be necessarily true or self-contradictory, or verifiable by sense experience. Hence utterances of logic and mathematics and utterances of empirical science, and similar utterances of both kinds in ordinary life, have the important standing of being statements, while utterances of religion, metaphysics, and ethics do not, and are to be understood as merely expressions of feeling. This doctrine was sometimes overstated as being to the effect that the latter utterances have no meaning at all, which in fact Ayer did not and of course could not believe. It is of about as

much effect that they do not come up to the level where utterances can be judged true or false.

In *Language, Truth and Logic* Ayer very much gives the impression—and sometimes says outright—that the verification principle is a *premise* or *basis* from which there follows, or on which there rests, the *conclusion* that the utterances of religion, metaphysics, and a kind of morality are neither true nor false. This is a matter, as already remarked, of their being in certain senses neither logical nor empirical. Ayer promises at the beginning of his book that he will provide a demonstration—or proof—of the verification principle.

It is also possible to wonder, more radically, whether the whole philosophical situation in which Ayer involves us is otherwise. At any rate, is it better described in a very different way? Does the whole argument really go in the other direction? Might it be that the supposed premise or basis mentioned above is the conclusion, and the supposed conclusion is the premise or basis? That is, an examination without presupposition of particular utterances of religious believers, metaphysicians, moralists, and the like shows these utterances to be *other than* statements or propositions, *other than* true or false. And this is summed up in—or provides good reason for—the generalization that is the verification principle.

It was said at the beginning of these reflections that Ayer is the greatest twentieth-century philosopher within a definable tradition established by Hume in the eighteenth century, and that this is arguably the greatest of philosophical traditions. That tradition can be understood in a certain way.

It has in it certain problems—those that are forced us on by our world and our common existence in it, and thus are not factitious. As important as any among these problems are those spoken of earlier as having to do with reality, knowledge, and perception. Also, this tradition is one of clearheaded reasoning, something carried forward in the light of experience and of theory close to it, not given to flying above it or being visionary about what lies under it. It is definitely not what we might call performance philosophy. Further, this tradition is not one of any specialism, but of the use of our shared intelligence, including our moral intelligence, in a general way. It is not just the philosophy of science or of mathematics or of any other department that makes a contribution to the subject of philosophy. It is not obscured or constrained by formalisms, or by science, whatever good use it makes of them.

It is not necessary to my judgment of Ayer's greatness, as you may anticipate, that Ayer's philosophy is now paid as much attention as, say, that of Willard Van Orman Quine. To be cited today but not tomorrow is a common fate of philosophers, scientists, novelists, and others. There is the fact of fashion in philosophy, and of oversight corrected later. It needs to be remembered that Hume was passed over for the chairs of philosophy at Edinburgh and Glasgow, and that little was heard thereafter of Mr. Cleghorn and Mr. Clow, deemed to be his superiors.

TED HONDERICH

BAKUNIN, MIKHAIL ALEKSANDROVICH (1814–1876), European revolutionary socialist and collectivist anarcho-federalist. Mikhail Bakunin, sometimes called the "father of Russian anarchism," was born to a Russian noble family in Tver Province. After two international revolutionary careers of the highest and still-continuing significance, he died in Berne, Switzerland, where he is buried. Bakunin's ATHEISM was most clearly expressed in two pamphlets published during his lifetime: *Federalism, Socialism, and Anti-Theologism* (1867) and *The Political Theology of Mazzini and the International* (1871), and also the posthumous *The Paris Commune and the Idea of the State* (1878) and *God and the State* (1882). He called his atheism "antitheologism" in riposte to Giuseppe Mazzini's program for Italy's national unification. Mazzini advocated an overtly religious concept of the state in the form of a bourgeois republic, a theocracy supposedly democratized by the people's spiritual unity, itself in turn reified as a unitary mass consciousness. Mazzini's ideas were thus anathema not only to Bakunin's antistatism, but also to his anthropocentric moral philosophy.

Bakunin's Road to Atheism. The first translator of both J. G. FICHTE and G. W. F. Hegel into Russian, Bakunin journeyed to Berlin to study philosophy in 1840. Two years later he caused his first sensation in Europe with the pseudonymous article "The Reaction in Germany." There he declared the negative rather than the positive to be the motive force in dialectical change, and drew the conclusion that revolutionaries should never compromise in the pursuit of social change. An advocate of Polish nationalism and then of Pan-Slav federalism in the 1840s, he participated in the 1848 February Revolution in Paris, then also in the insurrections in Prague (June 1848) and Dresden (May 1849). His arrest in the aftermath of the last ended the first of his revolutionary careers in Europe.

Bakunin's second revolutionary career in Europe began in 1862, following a dozen years of imprisonment and Siberian exile, from which he escaped and sensationally circumnavigated the globe. Landing in London in late 1861, he sought to continue where he had left off after his arrest in 1849. His atheism came to the fore with his transition from Pan-Slav federalism to international anarchism (see ANARCHISM AND UNBELIEF) following the czar's bloody suppression of the 1863 Polish rebellion. Reflecting that broadened scope, Bakunin moved in 1864 to Italy, where the confrontation with Mazzini sharpened his ideas on atheism.

Bakunin as Moral Philosopher. The significance of Bakunin's moral philosophy is only now being recognized. Its cornerstones were freedom and the individual's interdependence with society; from them, it fol-

lowed that any individual's freedom required every individual's freedom. Influenced by Ludwig FEUERBACH, Bakunin saw human history as a progression from animality to humanity. Man's capacity for abstraction marked the distinction between animal and human and was the key feature of human existence. Unfortunately, it also made possible the creation of such institutions as state and church. Bakunin's writings mercilessly contrasted religious pieties with the actual effects of religious institutions upon people's real lives.

Bakunin's atheism included a refutation of theism by reductio ad absurdum turning upon the theodicy problem (see EVIL, PROBLEM OF). More significantly, it was a corollary of his uncompromising opposition to hierarchical authority of any kind. Wherever any external source of law, whether human or divine, sought to impose itself on human society, Bakunin saw society's resistance as merely a manifestation of its own inherent natural laws. Theologism, that is, a theological doctrine institutionalized through social structures characterized by privilege and oppression, was contrary to natural law. From this followed Bakunin's "antitheologism," perhaps best encapsulated in two of his best-known aphorisms: "If God really existed, it would be necessary to abolish him" and "The State is the younger brother of the Church."

ROBERT M. CUTLER

BALLANCE, JOHN (1839–1893), New Zealand politician, newspaper owner and editor, prominent freethinker. John Ballance's father's political activities in Ireland gave him an early introduction to political life. His religious views were shaped by the experience of sectarian rioting in Belfast together with his mother's nonconformity. These, in conjunction with his belief in the importance of education and critical thought, led Ballance to an advocacy of secularism.

Ballance was born on March 27, 1839, at Glenavy, County Antrim, Northern Ireland, the eldest son of Samuel Ballance, a tenant farmer descended from Puritan immigrants from England, and his wife, Mary, a Quaker. Ballance was educated at Glenavy National School and at Wilson's Academy, Belfast. He left school before completing his education and from the age of fourteen was apprenticed to a Belfast ironmonger for four years. He then went to work in the ironmongery business in Birmingham, then a center of radicalism and the home of self-education. He attended classes at the Birmingham and Midland Institute, studying politics and history. There he was exposed to the ideas of Robert OWEN and the secularist movement. He also belonged to literary and debating societies and wrote articles for the press.

Ballance married Fanny Taylor in 1863 and migrated to New Zealand in 1866, settling in Wanganui, where his brother-in-law lived. Fanny died in 1868; two years later Ballance married Ellen Anderson.

In 1867 Ballance and Archibald Dudingston Willis established the *Wanganui Herald*. Early editorials in the *Herald* criticized the church, especially over unscrupulous land deals, and warned of the "evils of ecclesiasticism" in the colony. The establishment of the Wanganui Freethought Association by Balance and Willis in 1883 was a major development for the secularist cause. That same year the monthly *Freethought Review* was started, with Willis as publisher and Ballance as editor. It continued for two years until October 1885 and for a time was the only local freethought paper in New Zealand. In March 1884 a national conference of seven secular societies in Dunedin established the New Zealand Freethought Federal Union with Ballance's friend Sir Robert STOUT as president and Ballance himself as vice president. Resolutions were passed supporting the Oaths Abolition Bill, Charles BRADLAUGH's struggle in Britain, and opposing the legislation on BLASPHEMY. Although the union never met again, it assisted with the itineraries of visiting speakers for some time.

When Ballance entered politics his secularist views were not used against him by opponents. Occasionally an outburst of letter writing called for defeat of the "infidel." He took this in his stride and remarked that religion and politics should be kept separate. In 1875 Ballance was elected to the House of Representatives. In 1878 he was appointed commissioner of customs, minister of education, and colonial treasurer. He was involved in debates about land nationalization and the land tax.

After regaining his seat which he had lost in 1881, between 1884 and 1887 Ballance joined the administration led by fellow freethinker Robert Stout, holding the portfolios of Lands, Native Affairs, and Defense. One of his important achievements was the creation of a sixty-six-thousand-acre national park in the central North Island, which involved a gift of land by local Maori.

In parliamentary opposition between 1887 and 1890, Ballance proved to be an outstanding leader. During this time he adapted the work of English social theorists to

New Zealand's problems and concentrated on building a base among the urban working class. Ballance led the Liberals to victory in the December 1890 election. In January 1891 he formed the country's first Liberal government, becoming premier, colonial treasurer, and commissioner of customs.

The new administration moved quickly to introduce direct taxation and other tax reform. His government introduced legislation for which New Zealand would become famous: a new Factory Act, an Employers' Liability Act, and other acts to improve working conditions. It ran into opposition in the Legislative Council, New Zealand's upper house, which rejected a number of important measures, including the Industrial Conciliation and Arbitration Bill introduced by Ballance's friend and fellow secularist William Pember Reeves, who was the country's first minister of labor. To overcome the Legislative Council, which had been "stacked" with appointments by the outgoing government, Ballance asked the governor to make new appointments. When this was refused he appealed to the secretary of state for the colonies, who ruled in his favor, thus ensuring that the legislation was eventually passed.

Like his wife Ellen, who was a prominent feminist, Ballance strongly supported the female franchise and introduced a bill to this effect in 1892. However he did not live to see it implemented, becoming increasingly ill during 1892. He died on April 27, 1893, the first premier to die in office. He was succeeded as the member for Wanganui by his friend and fellow freethinker A. D. Willis. In 1991 Ballance House, the restored family home in Northern Ireland, was opened to the public to commemorate this famous man.

WAYNE FACER

BALLOU, HOSEA (1771–1852), American Universalist leader. Hosea Ballou persuaded most Universalists of the truth of Unitarian theology, the doctrine that God is one. Ballou's Unitarianism was readily accepted by most Universalists, who held that all men are saved (see UNITARIAN UNIVERSALISM). He was the last of eleven children born to a Calvinist Baptist preacher and farmer living in Richmond, New Hampshire. While he was a baby, his mother, Lydia Harris Ballou, died. After being tutored by his father, he briefly attended a Quaker school and Chesterfield Academy. Rejecting eternal damnation, he became an itinerant preacher in 1791. He married Ruth Washburn on September 5, 1795, and they had eight children. After early settlements he spent thirty-five years in Boston and died a respected Universalist leader.

Ten years before the 1805 Unitarian Controversy over the election of the supernatural rationalist Henry Ware to a divinity chair at the Congregationalist Harvard, Ballou opposed the doctrine of the Trinity. By then, he had convinced most Universalists of theological Unitarianism. That year Ballou published *A Treatise on Atonement*, his theory of universal salvation and Unitarian theology. Christ's mission, he held, was to reconcile humanity to God, not God to humanity. The Vermont deist (see DEISM) Ethan ALLEN's denial of infinite sin, Ferdinand Petitpierre's DETERMINISM, and Arminian Charles Chauncy's argument against eternal punishment influenced the book. There were two significant changes in Ballou's ideas between the 1805 edition of *A Treatise on Atonement* and that of 1832. His early Christology was Arian, but by 1832 he believed Jesus an ordinary human who had been assigned a divine task. While at first undecided about corrective punishment after death, by the second edition he definitely rejected it for punishment in this life, anticipating Ralph Waldo EMERSON's idea of "compensation."

In 1819 Ballou became editor of the *Universalist* magazine. As he did not believe in the Trinity, the magazine reflected his interest in Unitarian ideas. He published an account of Servetus's martyrdom in Calvinist Geneva, selections from Charles Chauncey's *Salvation of All Men* and Joseph PRIESTLEY. Priestley was an English Unitarian and a friend of Thomas Jefferson. Ballou also reprinted writings of Priestley associate Thomas Belsham and portions of William Ellery Channing's Baltimore sermon "Unitarian Christianity." The *Universalist* magazine introduced upper-middle-class and upper-class Unitarianism to a wider audience of ordinary people. As an editor Ballou avoided controversy, except in religion. He opposed the Standing Order, the tax-supported Congregational churches. Although he did not address most social questions, believing that only the triumph of Universalism would transform the world, he favored temperance and in old age he opposed capital punishment and slavery.

WESLEY V. HROMATKO

BARLOW, JOEL (1754–1812), American poet and diplomat. Born March 24, 1754, in Redding, Connecticut, Joel Barlow likely wanted most to be remembered as a poet, especially as the author of *The Columbiad*, a long epic he worked on for years and envisioned as the great American poem. *The Columbiad* got mixed reviews then and has not since become the basis for literary fame. An earlier version, *Vision of Columbus*, produced more acclaim when published in 1787. Barlow, a member of a group calling itself the Connecticut Wits, served as an American chaplain at the end of the Revolutionary War after graduating from Yale in 1778. He is best known now for "The Hasty Pudding," a short satirical mock epic poem that may have inspired Harvard University's famous club of the same name, and as the author and negotiator of a treaty with Tripoli (1796–97) that declared the US government was "not in any sense founded on the Christian Religion" (see TREATY OF TRIPOLI).

Barlow also wrote radical political philosophy, publishing "Advice to the Privileged Orders" (1792) in London, which the British government proscribed, and later publishing political essays in France. Thomas PAINE entrusted his draft of the first part of *The Age of Reason* to his friend Barlow just as the guards of the French Revolution hauled Paine off to prison in 1793, and Barlow assisted later with getting *Age of Reason* published. Barlow also corresponded with Thomas JEFFERSON.

Barlow died in Poland while on a diplomatic mission from the United States to Napoleon. As he drew near Napoleon, the French army was in retreat from the Russians, and Barlow died of pneumonia amid the exodus. His tombstone inscription in Poland roughly translates as "Joel Barlow, diplomat from the United States of America to the Emperor of France and the Queen of Italy; died here while traveling." He was fifty-eight.

ED BUCKNER

BAUER, BRUNO (1809–1882), theologian and gospel critic. Having studied with both G. W. F. Hegel and Friedrich Schleiermacher, Bruno Bauer was a pioneer of biblical criticism. For all its incisiveness (and indeed no doubt because of it), his work has been largely forgotten, at least in Christian-dominated Western circles. Bauer's scholarly legacy was, however, championed in the East thanks to his protégé Karl MARX. Bauer's theories became enshrined as the official Soviet ideology on the "historical" Jesus. Even today, Bauer's thick, erudite works on the New Testament (which got him discharged from his teaching post in 1842) are frustratingly, even glacially slow to appear in English translation, largely because few wish to hear what he had to say. Albert Schweitzer's friendly reviews of his books in *The Quest of the Historical Jesus: From Reimarus to Wrede* and *Paul and His Interpreters* seem to have inoculated Christian scholarship against wanting to hear more from Bauer, much less allowing the virulent germs of his ideas to spread among vulnerable theology students.

Bauer took up and significantly carried forward the work of two slightly earlier contemporaries, David Friedrich STRAUSS and Ferdinand Christian Baur, both of whom are usually denominated as radical critics. But in Bauer's estimation, each man, while courageously blazing a trail, lacked either the vision or the courage to pursue it to its end. This Bauer was determined to do with his eyes wide open. In his *Kritik der evangelischen Geschichte des Johannes* (1840) Bauer sided with Strauss, demonstrating the purely literary, theological, and unhistorical character of the Gospel of John. Soon, in his *Kritik der evangelischen Geschichte der Synoptiker* (three volumes, 1841–42), Bauer had realized that the earliest gospel, Mark, was no less likely to be a piece of edifying fiction. Like almost all modern scholars, Bauer recognized the dependence of both Matthew and Luke upon Mark (though he saw Luke as a rewrite of Mark, then Matthew as a rewrite of both Mark and Luke). In all this, Bauer made critical advances from which almost all scholars at the time and since have recoiled in loathing. Only today, busy reinventing the wheel, are some researchers coming independently to recapitulate his results, though very few even of these seem to understand the broader implications of the individual insights. Given that, on the one hand, Mark would seem to have been the sole source of "information" about Jesus, even for the ancients, and, on the other, that Mark appears to be fictitious, we must seriously question whether the very figure of Jesus is fictive. Bauer concluded that he was.

Bauer anticipated the whole trend of form criticism by recognizing how saying after saying of the gospel material reflected the life context of the Christian community,

not that of Jesus and his contemporaries. One major instance would be the constant summonses to be ready for persecution, a retrojection of the ill fortunes of the church in subsequent generations. The missionary instructions preceding the sending out of the disciples (Mark 6:7–13; Matt. 10:5–42; Luke 9:1–6) likewise anticipate future church history while conspicuously lacking any specific instructions appropriate to the mission the disciples are ostensibly on the point of undertaking. The supposed sermons of Jesus are instead mere collections of unrelated maxims and parables (not that these cannot have gone back to a historical Jesus, but their atomistic character reveals the fictitious native of the picture of a preaching or discoursing Jesus).

Bauer's insights on the Messiah doctrine were among his most radical. First, he noticed that the first version of the Jesus story, Mark's, did not imagine Jesus coming forward proclaiming himself as the Messiah; indeed, just the opposite, since the Caesarea Philippi scene (Mark 8:27–30) reveals that no one, even among his many followers, held such an idea concerning him—something scarcely possible if he had been teaching that very thing! Subsequent evangelists obscure this Markan theme, reading their own faith even more directly into the story, by having Jesus preach his messiahship from the first.

Beyond this, Bauer suggested that the very notion of "the Messiah" was a Christian invention later adopted by Jews. As the subsequent studies of Sigmund Mowinkel, Helmer Ringgren, and others have made even clearer, Old Testament passages cited by Christians as "messianic prophecies" not only have no discernible connection with Jesus, but do not even transcend reference to the ancient Jewish monarchy (and its anticipated restoration). Intertestamental Jewish writings predict a millennial age of redemption, but the Messiah is conspicuous by his absence—or else appears to owe his position to later Christian interpolators (e.g., Similitudes of Enoch, 4 Ezra).

Christianity began in Alexandria, as Bauer envisioned it, among the mystical ascetic Jews whom Philo calls the Theraputae. Philo's own doctrine of the Logos (the divine Word, a piece of Stoicism read into the Bible) provided the mytho-theological undergirding for the Christ concept. The moral content came from Hellenistic Roman sources, especially from Seneca. In *Christ and the Caesars* (1877), Bauer described how Seneca advised that the person who sought moral maturity ought to choose for himself an ideal guide and companion to accompany him, in imagination, each day and every hour. One ought to envision such a person's reactions to one's contemplated actions and thus one might keep to the straight and narrow. This suggestion, Bauer decided, must have been what catalyzed Mark's decision to concretize the collective experience of the Christian community into a literary character, Jesus Christ, who thus turns out to be equivalent to John Bunyan's protagonist Pilgrim. (Again, Johannes Weiss and, after him, Rudolf Karl Bultmann and the form critics, vindicated in ample detail Bauer's contention that saying after saying, story after story, represented not the *Sitz-im-Leben Jesu*, or "life setting of Jesus," but rather the *Sitz-im-Leben Kirche*, the "life setting of the church.")

The melding of Jews and (mainly underclass) Romans to produce Christianity was not entirely smooth. The Greek side issued in law-free Gnosticism, which chafed at Christian Jews' insistence that Christians must keep the Torah. As Bauer argued in his *Kritik der Paulinischen Briefe* (three parts, 1850–52), the Acts of the Apostles was produced by the Jewish side, appealing to Paul (a dubiously historical champion) in behalf of legalism, while the Epistles were the response of Greek Christians of an antinomian, Gnostic bent. The historical Paul, if there was one, had nothing to do with any of them. This Bauer (and his successors among the so-called Dutch Radical School, especially W. C. van Manen) showed by applying the same critical criteria that had led F. C. Baur to deny Paul all but the *Hauptbriefe*, the "principal epistles": Romans, Galatians, 1 and 2 Corinthians. Baur repudiated Bauer, and by the time of Bultmann, supposedly critical scholars had backslid to consider Philippians, 1 Thessalonians, and Philemon authentically Pauline also. Today, the theories of Bauer and the Dutch Radicals are advanced by a tiny group including Hermann Detering, Darrell Doughty, and the present writer.

ROBERT M. PRICE

BAUM, L. FRANK (1856–1919), American author. L. Frank Baum, author of the Oz books (1900–1920) and other fantasies for children, pointedly omitted religion from the marvelous worlds he created. Oz is a utopia where people are naturally inclined to help and respect

each other because they are happy. Laws are minimal and reasonable, and law enforcement is no problem because people have no motive to disobey. When confronted with difficulties, the characters draw on their own enterprise, ingenuity, and common sense to solve them. There is no mention of divine sanctions, because none are needed.

Born in upstate New York, Baum grew up in a pious Methodist household in which his mother strictly enforced observance of the Sabbath. But by his midthirties, when he was editing a South Dakota newspaper, the *Aberdeen Saturday Pioneer*, Baum was a committed unbeliever. He was probably influenced by his mother-in-law, the eminent suffragist Matilda Joslyn GAGE, who maintained that the established churches were "the bulwark of woman's slavery" (see also WOMAN SUFFRAGE MOVEMENT AND UNBELIEF). In the very first issue of the *Pioneer*, Baum celebrated "the age of Unfaith." *Unfaith* did not mean ATHEISM but THEOSOPHY, a theistic system that satisfied the intellectual and emotional needs of people like Baum and Gage, who could not accept orthodox religion and blind faith, but also needed to believe in something beyond the material world. Theosophists aimed to investigate the spiritual world (see SPIRITUALISM AND UNBELIEF) exactly as scientists investigate the physical world, and they believed that people should look for strength within themselves rather than praying to God for help. Nine months after his first editorial, Baum proceeded to an open attack on conventional religion. "Fully two thirds" of the American people are unchurched, he declared. And this percentage will become greater because "[t]he people are beginning to think," therefore they will reject "the same old superstitions, the same blind faith in the traditional bible, the same precepts of salvation and damnation" that the church persists in teaching.

Baum indirectly mocked orthodox piety in two non-Oz fantasies, where he allegorically satirized the orthodox concept of heaven. Among the marine creatures introduced in *The Sea Fairies* (1911) are mackerel who eagerly take the bait and the hook because they are convinced that when one of them is jerked out of the water and disappears "he has gone to glory—which means to them some unknown, but beautiful sea."

Baum's most detailed satire on the orthodox concept of heaven appears, remarkably, in *Policeman Bluejay* (1907), a book for small children. The story is set in a forest where owls kill to eat and human hunters slaughter animals for fun. In its center is the Land of Paradise, appropriately populated entirely by birds of paradise, which is blissfully free of the need, conflict, and suffering that dominate life on the outside. Bathed in rosy light and filled with flowers and fruits that constantly regrow, this land is indeed a paradise in its sharp contrast to the stressful life of the forest. It represents the biblical Garden of Eden—humankind once lived there, "but for some unknown crime was driven away"—and perhaps heaven as well. The King Bird of Paradise, who exists solely to be perfect and to be admired by his beautiful and sinless subjects, does bring to mind God surrounded by the heavenly hosts who sing hosannas all day long. In either case, it is far from the ideal place of orthodox Christian doctrine. Baum's unfallen creatures are vacuous and complacent, doing no evil because they have no temptation. This is very different from the Theosophist heaven, where souls actively strive for improvement of themselves and the world. It also contrasts strongly with the rich variety of Oz, where conflicts arise between diverse individuals and characters must make an effort to be good and achieve success.

Baum should not, perhaps, be described as a secular humanist, for he believed in the reality of things unseen and in universal moral as well as physical laws. But he rejected the idea of a divine lawgiver imposing laws on nature. And in Oz he created an ideal world that works very well using only human wisdom, human effort, and human goodwill.

KATHARINE M. ROGERS

BAYLE, PIERRE (1647–1706), French Protestant writer. Freethinker, journalist, the most important skeptic of the late seventeenth century, and a promoter of toleration, Pierre Bayle's influence on the development of unbelief was enormous. It is by no means clear, however, that Bayle himself espoused unbelief.

Early Life. The son and brother of Protestant pastors, Bayle grew up in Le Carla, a small village in southwestern France. He entered adulthood as the anti-Protestant legislation of the regime of Louis XIV gained momentum. He studied briefly at the Protestant Academy in Puylaurens (1668), but without telling his family, he transferred to the Jesuit College in Toulouse, where, on March 19, 1669, he converted to Roman Catholicism, which, for a brief period, he came to believe was the true church. Shortly after defending his MA in August 1670, however, he returned to the Protestant faith, which made him liable to the severe penalties meted out to lapsed Catholics under French law. He fled France for Geneva, completed his theological and philosophical studies there, and in 1674 returned to France under an assumed name, working as a private tutor in Rouen and Paris, and from 1675 as professor of philosophy at the Protestant Academy in Sedan, until it was closed down by royal decree in July 1681. Bayle then moved to Rotterdam, where he was professor of history and philosophy at the *École Illustre*; but this post was abolished on October 30, 1693. At that point, Reinier Leers, Bayle's friend and publisher, paid him a small

annuity, which made it possible for him to devote his life to scholarship. However, Bayle's pursuit of what he believed was the truth, whether in history, philosophy, or theology, brought him into conflict with the orthodoxies of his time and with those who defended them. In 1697 the authorities of the Walloon (French Protestant) Church in Rotterdam formally censured Bayle for what they described as the scandalous and reprehensible way he had written about ATHEISM, the Bible, the problem of evil (see EVIL, PROBLEM OF), and SKEPTICISM in the two volumes (later four) of the first edition of his biographical *Dictionnaire historique et critique* (Historical and critical dictionary; first ed., 1697; second ed., 1702).

Atheism. In his writings, and especially in the *Dictionnaire*, Bayle drew sympathetic portraits of atheists, the prototype being Baruch SPINOZA, to whom Bayle devoted the longest of his biographical entries. In the early modern period, atheism was presumed to lead to immorality and social disorder because atheists had no fear of God or divine retribution, attitudes believed necessary to morality and the maintenance of civil society. As early as 1682, in his writing about the comet, Bayle advanced what was a notorious paradox for its time, namely, that atheists could live together morally and peaceably in society, while people of religious principle often lived immorally and could be a menace to social order. His argument was based on the assertion that human beings are motivated less by principles or belief than by their dominant passions, temperament, self-love, self-interest, or education. However, Bayle also believed that the first principles of morals are available to human reason independently of knowledge of God and that people could behave morally out of a love of virtue for its own sake. This opens up at least the possibility that atheists may embody an irreproachable and genuine morality that is consistent with rational ethical principles.

The Bible. The authorities of the Walloon Church also took issue with Bayle for the negative way he presented important figures from the Old Testament in the *Dictionnaire*. In the triptych Bayle devoted to Abraham, Sarah, and Hagar, or in the longer and polemical article on David, he dwelled at length on their immoral behavior, pointing to the lies, sexual aberrations, cruelties, and political chicanery of these figureheads of the Jewish and Christian traditions. Commenting on the life of David, Bayle famously observed, "He is a Son of Holiness in the Church . . . but that Sun had its Spots," which he proceeded to enumerate and censure. VOLTAIRE harnessed Bayle's biblical articles to his own jocose irreverence in his *Dictionnaire philosophique* (Philosophical dictionary), making it difficult for them to be read as anything but an ironic onslaught on religious belief. Yet Bayle's position is more complex. He believed that all conduct, whether that of atheists or believers, is to be judged in the light of the ethical principles available to reason. The result is certainly iconoclastic but it is not inconsistent with a broadly defined Calvinist tradition of biblical interpretation on which Bayle explicitly draws. He also has a political motivation. By making scripture subject to ethical scrutiny, and arguing that any interpretation that involved committing a crime was false, Bayle was seeking to undermine the way Saint Augustine (and those who followed him) interpreted scripture to justify coercing the consciences of those deemed heretical or heterodox. However, Bayle's insistence on the criteria of reason and ethics in biblical exegesis provided him with his greatest—and, to his contemporaries, most scandalous—conundrum.

The Problem of Evil. Bayle states the problem in the *Dictionnaire*: "the manner of introducing evil under the empire of a sovereign being, infinitely good, infinitely holy, and infinitely powerful is not only inexplicable but also incomprehensible." And he did not flinch from demonstrating just how inexplicable it is. For example, putting words into the mouth of an *abbé philosophe*, he applies the criteria of reason and ethics to the problem and, by ironic implication, finds God wanting: "It is evident that evil ought to be prevented, if it be possible, and that it is a sinful thing to permit it when it can be prevented. Nevertheless, our Theology shews us that this is false. It teaches us that God does nothing but what becomes his perfections, when he permits all the disorders that are in the world, and which might easily have been prevented." Bayle pointed to the miseries, misfortunes, and catastrophes of human beings and the world they inhabit, arguing that dualism—the view that if God is good, then evil originates from a rival force at war with God—was more consistent with the evidence than theism. And he was adamant that no theodicy (philosophical effort to reconcile God's goodness with the existence of evil in the world) could resolve the dilemma of the undeniable existence of natural, personal, and systemic evil in a world that believers held was created and sustained by a good and all-powerful God. REASON and faith, philosophy and theology, are irreconcilable on this issue.

Skepticism and Fideism. Bayle's radical critique of theodicy is part of a series of articles in the *Dictionnaire* in which he revived skeptical themes in an attempt to undermine the dogmatic claims of all metaphysical systems. Among these Cartesianism was a favorite target, with its criterion of self-evidence, clear and distinct ideas, mind-body dualism, distinction of primary and secondary qualities, and mathematical explanation of space (see DESCARTES, RENÉ). But Bayle also precipitated a skeptical crisis in Christian dogmatics by the way he applied self-evident principles to certain doctrines, notably those of the Trinity, the immortality of the soul, and transubstantiation, only to find them wanting. Bayle consistently argued, however, that his skeptical critique of rational and religious certitudes had a preparatory function. He claimed that his purpose was to liberate readers from all forms of dogmatism and lead them to faith. The fact that such faith is sometimes at odds with

what we know to be true or right (as in the case of the problem of evil) or has no rationally demonstrable content has led many critics to interpret Bayle's fideism as an ironic, self-protective device. Skeptical doubt and religious belief are not mutually exclusive in Bayle's worldview, however. Throughout his writings he argues for the possibility of true knowledge and a degree of certainty, provided they are held as probable and provisional, open-ended and always subject to revision. This attitude is inspired by the skeptical Christian HUMANISM of the Renaissance, which Bayle admired, with its ideal of moral, moderate, and tolerant religious belief and practice.

The Baylean Footnote. Bayle's *Dictionaire*—a massive four volumes in folio in its final form—is a monument of learning, which became an unlikely best-seller in the eighteenth century. The text of each biographical entry has three levels: a narrative at the top of the page; two columns of footnotes in smaller print underneath, linked into the narrative by the capital letters of the alphabet; and down the left- and right-hand margins, citations of sources in tiny print, attached to the narrative by the lowercase letters of the alphabet and to the footnotes by numbers. The footnotes provide a running commentary on the narrative, and are laden with mind-numbing erudition, which Bayle sought to enliven with philosophical and theological conundra, ironic commentaries on the vagaries of human life, and salacious anecdotes. According to a tenacious myth among readers of the *Dictionaire*, Bayle put his most scandalous, heterodox, and irreverent comments in the footnotes in order to hide them from censorship. Recent research has shown, however, that both the narrative and the footnotes are animated by the same personal, ironic, and philosophical tone. Besides, Bayle's critics and censors "were also habitués of works of erudition, expert explorers of scholarly apparatus. No nook or cranny in a suspect commentary could escape their attention," to quote Anthony Grafton. In fact, the organization of the articles in the *Dictionnaire* reflects Bayle's understanding of knowledge as an essentially dialogic, even polyphonic, engagement with a multiplicity of unmerged voices and consciousnesses in the quest for truth. He constructed his *Dictionnaire* as a virtual library in the early modern manner, that is, a place of encounter and discussion, where the books cited in the margins were opened and read into the articles as a prelude to scholarly disputation and interaction. His own models for this open-ended, always unfinished quest were humanist, but his *Dictionnaire* helped to shape the discursive and collaborative models of knowing that characterize the Enlightenment.

Bayle and Unbelief. Many of Bayle's readers, then and now, think of him as an unbeliever attempting to undermine faith by making it seem irrational and ridiculous. Others argue that he was a "speculative atheist," who rejected all proofs and demonstrations of God, and therefore, by logical implication, God's existence. However, Bayle's critique of human knowing and pretensions to rational, dogmatic certitude, whether philosophical or religious, is compatible with his Calvinist conviction that God is rationally inscrutable and ultimately incomprehensible. It is also part of Bayle's lifelong attempt to subvert certainty—wherever he met with it—in order to counter its violence and undermine the way it was used to justify the persecuting society. He was adamant that tolerance—of people of all beliefs or of none—is the basis of both civil society and social stability. In sum, Bayle was a person given to paradoxes, whose life, thought, and influence make him both freethinker and Protestant.

RUTH WHELAN

BEAUVOIR, SIMONE DE (1908–1986), French feminist philosopher and author. Born into a bourgeois Parisian family at the beginning of the twentieth century, Simone de Beauvoir would not have been encouraged to pursue a career were it not for the relative impoverishment of her family. She was educated at a Catholic girls' school and was tempted by mysticism until the age of fourteen, when she lost her faith. Having studied philosophy at the Sorbonne, she passed the *aggregation* in philosophy in 1929, coming second to Jean-Paul SARTRE, who had become her lover. During the 1930s she taught philosophy at lycées in Marseille, Rouen, and Paris, and it was not until 1943 that she published her first novel *She Came to Stay* (*L'Invitée*). After the war she helped set up the journal *Modern Times* (*Les Temps Modernes*) with Sartre, Maurice Merleau-Ponty, and Albert CAMUS. In an article in this journal titled "Littérature et Métaphysique," she explained her desire to write philosophical novels in which the abstract truths of a philosophy would be clothed in concrete detail so that they expressed a living, emotional truth. She did not consider herself to be an original philosopher, since she reserved the term *philosopher* for those like Sartre and Martin Heidegger, who had developed an all-encompassing abstract system. Nevertheless, as well as publishing five novels, a play, short stories, and four volumes of memoirs during her lifetime, she also published a number of philosophical essays. Of these, *The Second Sex* (*Le deuxième sexe*), her account of the situation of women examined from the point of view of an existentialist ethic, has been by far the most influential.

In *The Second Sex* Beauvoir set out to answer the question: How it is that women, though free conscious beings like men, came to be dominated by men so that all culture, history, and religion seemed to have been created by them? She criticized all deterministic accounts of women's inferior social situation, arguing that neither biology, nor psychoanalysis, nor Marxist materialism sufficed to explain women's acceptance of a position of social secondariness. In place of these explanations, and supplementing them, she drew on G. W. F. Hegel's claim that there is a fundamental conflict between consciousnesses. A quote from Hegel, "[E]very consciousness seeks the death of every other consciousness," introduced the French edition of Beauvoir's *She Came to Stay*, and this novel develops, in its account of a love triangle, the conflicts between conscious beings that are explored at a social level in *The Second Sex*. In the introduction to *The Second Sex*, Beauvoir sums up her analysis of the situation of women by asserting that man is the subject, woman the other. Woman finds herself in a situation where her consciousness is transcended by another consciousness, and she is "the inessential." Beauvoir seems to vacillate over the question of whether woman's acceptance of her role as the other of man is due to oppression or to the moral fault of bad faith. She says that falling into the role of the other constitutes oppression if it is forced on one, but bad faith if, out of a fear of freedom, one consents to it. Her attempt to show how oppression and nonreciprocal relations between humans derives from fundamental features of consciousness was influenced by the US black activist Richard WRIGHT. It is also structurally similar to the account of the oppression of the Jews in Sartre's *Anti-Semite and Jew* (*Réflexions sur la question Juive*), which itself may have been influenced by Beauvoir's earlier reading of Hegel and her development of Hegelian ideas during the war. Because the translation of *The Second Sex* into English was philosophically illiterate, and because many English-speaking readers knew little of existentialism, Beauvoir's text has mistakenly been read as a sociological account of gender construction and not as an essay in existentialist ethics.

In the period just after the war, Beauvoir wrote two philosophical essays. These attempted to demonstrate that existentialism is not a moral nihilism, and that it is possible to create an ethics of ambiguity that does not deny a priori that separate existences can at the same time be connected. Such an ethics would show how individual liberties can forge laws valid for all. The first of these essays, *Pyrrhus et Cinéas*, has only recently been published in English; the second, *An Ethics of Ambiguity* (*Pour une morale de l'ambiguité*), is a major source for Beauvoir's own reading of the meaning of existentialism. However, in her autobiography, written when she had moved closer to Marxism, she criticized this work for its idealism and lack of a philosophy of history. Nevertheless, it has become an important tool for those interested in Beauvoir as an original thinker. In it she raises the problem that childhood poses for any existentialism, such as Sartre's, that proposes that every consciousness is free and is in bad faith insofar as it flees its freedom. Clearly a child, though in some sense conscious, is not free. By the early 1960s, when he wrote *Words* (*Les Mots*), Sartre too had come to recognize the importance childhood has in determining one's worldview. He wrote an amusing account of how the beliefs of the philosopher of absolute freedom were determined by a childhood milieu that fated him to follow a path leading to faith in the value of freedom and literature.

From the late 1950s Beauvoir wrote a series of autobiographical memoirs that crafted her life story as an existential quest. In these memoirs, which mixed biographical details with a discussion of philosophical works, political movements, and events, Beauvoir found a medium that perfectly suited her desire to fuse philosophy with an account of a singular reality. Here she achieves her early stated intention by clothing the abstract truths of existentialism with the living, emotional truth of a single individual attempting to live out an authentic existence. This project can also be seen to infuse the novels for which she is most famous, *The Blood of Others* (*Le sang des autres*, 1945), *All Men Are Mortal* (*Tous les hommes sont mor-*

tels, 1946), and *The Mandarins* (*Les Mandarins*, 1954), for which she received the Prix Goncourt. By writing philosophy in the guise of literature and essays directed at a broad, engaged public, Beauvoir has come to have a far greater impact on contemporary attitudes, particularly in the realm of relations between the sexes, than have many male philosophers who have concerned themselves with constructing abstract systems.

KAREN GREEN

BELGIUM, UNBELIEF IN. Since Belgium gained independence in 1830 it has undergone a progressive de-Christianization, so that as of 2003 less than 10 percent of the population in the principal towns attends religious services weekly. In the capital, Brussels, the figure is less than 5 percent. An ever-increasing part of the population is not concerned with religion, and in everyday life does not obey the instructions of any church regarding divorce, abortion, and family and ethical questions. Such disinterest is especially obvious among Catholics.

Belgium has become de-Christianized without a revolution and without any religious war. Strangely, Catholic schools managed by the Catholics still enroll a majority of pupils in Flanders (the northern, Flemish-speaking half of the country) and a large part of pupils in Wallonia (the southern, French-speaking half of the country), but many of these schools are Catholic in name only. This is especially ironic because the division between supporters of the Catholic schools and defenders of public education has been a principal point of conflict between religiously orthodox conservatives and reformers who tended to be heterodox or irreligious. Today, many in the latter group are atheists (see ATHEISM), but this was not always so.

When the public schools movement began in the nineteenth century, most Belgians believed in a deity and even took part in religious services, but they wanted to free themselves from the constraint of the dominant Catholic Church and of its clerical authoritarianism. They were not so much antireligious as anticlerical (see ANTICLERICALISM).

In the mid-nineteenth century Belgium's first FREETHOUGHT organizations, humanist leagues (see HUMANISM), and people's universities were established around the principle of giving the public authorities and society as a whole greater independence from the churches. The oldest of these organizations was the Ligue de l'Enseignement (Teaching league), a pressure group and think tank that has spearheaded defense of the public schools since its foundation in 1864 until today.

Reformers, originally deeply anticlerical and later progressively nonreligious circles, sought to increase the public sector's autonomy relative to the churches. They drew upon the concept of *LAÏCITÉ* as it had developed in France (see FRANCE, UNBELIEF IN) and embraced the "separation of churches and state" as a model for institutional relations in Belgium.

During the second half of the twentieth century, numerous explicitly humanist organizations were established with the aim of defending and expressing humanist values in such varied fields as lifelong education, radio and television broadcasting, moral counseling in prisons and hospitals, international development—in short, all of the fields in which the de facto monopoly of the dominant religious ideology remained to be broken down. More radical humanist organizations offered contraceptive education and devices (still a taboo as late as the 1960s and illegal until 1973), later establishing fully equipped abortion clinics that operated with perfect medical safety—though completely illegally.

Legal Recognition. A feature common to church-state relations both in Belgium and in France is the remuneration of chaplains in hospitals, prisons, and the army in order to "ensure the free practice of religions." In Belgium as in several French *départements* (provinces), ministers of religion are paid by the state though there is no established state religion. By the mid-twentieth century it was clear that such a system constituted grave discrimination against unbelievers. It is as though atheists, agnostics, and other nonreligious people—in a hospital, in the army, or in everyday life—do not have to face problems, too, and do not need to receive support corresponding to their LIFE STANCE, which would mean for nonreligious persons support that is not based upon a religion or a belief in God.

That is why, in Belgium as in other European countries, humanists and other unbelievers have demanded "equal treatment by the state" for all life stances and worldviews, whether religious or not. Such a demand corresponds to the notion of a secular state that is truly impartial with regard to the worldviews of all its citizens.

Since 1964 the first foundation was registered in Belgium to provide nonreligious, humanist moral counseling to prisoners. Since then a number of so-called nonconfessional organizations have been set up to provide a nonreligious parallel to clerical counseling

throughout Belgian society. In the early 1970s, coordinating bodies were formed to facilitate the work of nonconfessional organizations. In Flanders was formed the Unie Vrijzinnige Verenigingen (Union of Freethinker Organizations); in Wallonia, the Centre d'Action Laïque (Center for Secular Action). That organization is entirely democratic in its structure.

Together, the two organizations represent the class of nonconfessional organizations before the public authorities. They have pursued two major strategic objectives: first, to obtain for official recognition of nonconfessional organizations by the state, securing the same treatment given to any of the churches; and second, promoting secularism within public institutions so that laws, political decisions, and the like do not favor a particular religion or worldview over others.

Objectives. As early as 1970, the Fondation pour l'assistance morale laïque (Foundation for Secular Moral Counseling) was created in order to provide humanist moral counseling to hospital patients. But it took more than twenty years of activism and lobbying until, in 1993, the Belgian parliament approved an article of the nation's constitution providing that "the salaries and the pensions of the organizations, recognized by the State, providing moral counseling according to a philosophical non-confessional life stance, are taken charge of by the State."

This entailed the official recognition of an organized community of "nonconfessional persons" whose counselors are paid by public authorities. The law of June 21, 2002, determined the levels of payment and allocated specific public resources for direct payment of salaries for humanist delegates spread out across the country. There are currently 230 such delegates who provide professional support for local humanist associations as well as individuals.

Especially in light of this reform, it must be emphasized that the philosophical nonconfessional communities are not churches, and secularism is not a religion but a life stance. Indeed, it is a life stance of great social importance; while it has proven difficult to estimate the number of atheists and other nonbelievers precisely, it is generally acknowledged that they form the second-largest life stance community after Roman Catholicism.

The second major objective of the nonconfessional movement addresses society as a whole: it is the campaign to promote a secular society. This is a somewhat more radical goal than secularizing of the schools or building counseling networks to parallel the clergy. It seeks nothing less than to build a fraternal, progressive, and just society, endowed with impartial public institutions that guarantee human rights and the dignity of persons, ensuring for everyone freedom of thought and expression as well as the equality for all before the law without any distinction of sex, origin, culture, or worldview.

One must recognize that the majority of those who have defended this principle in the past were nonreligious, atheist, agnostic, or religiously indifferent. This situation has changed, and today many Catholics have come to embrace the principle that society should be organized so as not to discriminate according to worldview.

The results that have been obtained on the legislative and political level during the last twenty years bear witness to the movement's success in bringing about the secularization of Belgian public institutions.

That situation has considerably reduced the influence of the churches, particularly the Catholic Church, in the nation's political life. Consequently, a number of policies opposed by the Vatican, like abortion, euthanasia, and marriage and adoption of children by homosexuals, have been implemented with large political majorities, making Belgium (with the Netherlands) a particularly progressive country.

Participation. Let us examine the organization of nonconfessionals in Wallonia, the French-speaking part of Belgium, which has about 4.5 million inhabitants. The Centre d'Action Laïque (CAL) is the federation of French-language nonconfessional organizations. It coordinates the activities of its federated organizations across seven administrative regions. The federated organizations develop activities in their particular fields: international development, moral counseling for prisoners and hospital patients, audiovisual production, education, humanist housing, humanist ceremonies (see RITUAL, CEREMONIAL, AND UNBELIEF), and many others.

The administrative regions also serve some 330 local organizations, which set up varied activities, often lectures, but also service projects such as family planning centers.

The essential part of the actions undertaken by the CAL and its regional sections consists in promoting active citizenship based on the personal elaboration of a life stance founded on human experience and excluding any confessional, dogmatic, or supernatural reference.

The organization, on a federal basis, of cooperating humanist organizations that were previously scattered has turned out to be very useful to reply to those who advocate dogmatic ideologies. It also serves to remind the state of its responsibilities, so that the public sphere remains large, free, and open to all without distinction. Finally, this development has put Belgians of religious and humanistic convictions on a more equal footing.

GEORGES C. LIÉNARD
TRANSLATED BY EDITH NAGANT

BELIEF AS A PSYCHOLOGICAL PHENOMENON.

Believing and Beliefs. Believing as a psychological and biological process can be distinguished from beliefs themselves. While all individuals engage in believing, they do not share all the same beliefs. Believing is, among other things, the process of having expectations. People sometimes differ sharply in what they expect from various aspects of their physical and social environment. Animals have expectations and can correct many of them, even though they cannot describe them in words.

Skepticism. Doubting is an essential ingredient of believing or expecting. To expect the social and physical environment to behave in certain ways is to doubt that it will behave in certain other ways. While believing as a psychological phenomenon proves necessary to living, not every belief or expectation is necessary. Some are required for survival, others are lethal if acted upon, while some prove either helpful, harmful, or negligible.

Skepticism, like believing, does not exist in the abstract. It is always relative to a given claim or expectation. Healthy skepticism develops through the trials and errors of both one's own experiences and those of others. Caution develops as we fine-tune specific claims and reflect on the actions based on those claims. Like reckless believing, excessive caution carries its own dysfunctional consequences.

Believing In and Believing That. In most, if not all, cases of believing in something, we believe that certain relevant claims are true. If we believe *in* our family doctor, for example, we believe *that* she will tell us the truth about our condition as best she can, *that* she is in good standing with the medical profession, *that* she does not engage in certain shady practices, and so on. We expect that she will recommend a specialist if needed, but not that she will lend us the money to pay our hospital bills. To believe in prayer is in some cases to expect *that* certain things will or will not come about because of the prayers. To avoid having to acknowledge that prayer expectations or predictions fail to materialize, believers sometimes either (1) avoid being specific about what is expected or (2) pretend that no answer is an answer.

In other cases, those professing to believe in prayer think that the prayed-for result *might* come about, which is to say it also might not. This is not so much an expectation or prediction as a hope. The word *faith* (which is a cognate of *belief* in ancient Greek) is often used to mean "hope."

It is useful to ask, What does a believer imply about a putative god who allegedly answers relatively trivial prayers but declined to answer the prayers of suffering Jews in Buchenwald or Auschwitz? In 1980 Bailey Smith, the president of the Southern Baptist Convention, stated, "God Almighty does not hear the prayer of a Jew." To believe *in* this version of a putative omnipotent being is thus to believe *that* he did not desire to rescue the Jews from their Nazi captors.

Implicit and Explicit Beliefs. Certain beliefs imply other beliefs. An implicit belief or expectation is one we would consciously recognize if we were consistent. Some Christians who believe in the "ultimate harmony" imply that the sufferings of the majority of the human race in the endless Auschwitz called hell will contribute significantly to the happiness of those in heaven. To believe in this cosmic system is to imply further that the inmates of hell perpetually pay the supreme sacrifice. Their endless agony is necessary to the entire scheme. The sufferings of Jesus pale by comparison.

In some cases, we resist making some of our implicit beliefs explicit. Friends, therapists, and opponents may help us to explicate our implicit beliefs. Often when our decisions and actions come into conflict, we recognize that some of our background beliefs stand at odds with one another. Bernard J. Paris points out that many of Shakespeare's plays are about people who, having made dysfunctional bargains with their environment, suffer the consequences of either their inability to correct their mistakes or their waiting too long to forestall the destructive consequences of their unrealistic expectations. Macbeth believed he could both commit murderous treachery and subsequently gain the loyalty of those who had remained loyal to King Duncan. King Lear mistakenly expected to receive love, devotion, and admiration from his two Machiavellian daughters, Goneril and Regan. In many ways, King Lear's great tragedy unfolds largely because of actions taken upon delusional beliefs about himself and those surrounding him. The play is a clinical study of highly destructive beliefs or expectations that remained acted upon, unexplicated, and therefore not understood until it was too late.

The Psychology of the Implicit. The so-called subconscious mind is mostly the process of acting on implicit beliefs. Much, if not most, of life has to be lived in this way. The most conspicuous way of explicating beliefs is to verbalize them in a public language. Musicians in practice sessions and during music lessons become more explicit than when performing. Playing the instrument is different from talking about playing. Subvocal talking in private is the implicit becoming more explicit.

Resistance to explication in some cases stems from a vague awareness that certain beliefs and the actions linked to them will have to be changed. Explication can expose foolish expectations. Some people build a significant portion of their lives around foolish and contradictory beliefs. To sustain this aspect of their lives, they often find a group of fellow believers who share their beliefs. To maintain this social network, the participants must reinforce one another in a variety of ways. The group may serve also to restrain some of the believers from taking their beliefs too seriously, that is, from acting on them. To talk about the imminent return of Jesus, for example, and to reinforce one another for talking in this way is one thing. It is another to cash in insurance policies and liquidate investments for financing last-minute missionary and evangelistic activities. If action is the indicator of genuineness of a strong belief, most of those who speak of Christ's imminent second coming appear not to expect it to happen soon but to hope it will or think it might. Evangelist Mordecai Ham, after years of preaching the imminent return of Jesus, advised a young Billy Graham to ease up on specifying dates for the return. In *Reading the Signs*, T. C. Smith notes that some of the first-century Christians had

to revise their account of Christ's pending return to earth. By in effect making explicit their expectation, they came to see that their belief had been falsified. While the last New Testament book to be written, 2 Peter, still clings to the expectation of Jesus's physical return, its author apparently felt the need to explain why the earlier predictions had failed.

The Psychology of Magical Beliefs. The world-famous Polish anthropologist Bronislaw Malinowski did his field work in the Trobriand Islands of Melanesia between the two world wars. He noted that the Trobriand Islanders drew a clear line between their work and their magical rituals. Their garden work and canoe building proceeded along rational paths of learning from experience and revising their technology to solve specific problems. Their complex system of principles of sailing included a rich terminology and a tradition of know-how. When navigating in the dangerous open sea and when encountering incalculable tides, sudden gales, unknown reefs, and other unmanageable contingencies, they resorted to magic. In warfare the natives relied on strength, courage, and agility. Magic came into play when predictability waned and the natives had to deal with luck and chance.

The growth of science can be studied as a movement from the anthropomorphic paradigm to one in which natural events occur in regularities that are not discovered through, or related to, supernatural purposes and activities. God-talk continues to run *parallel* to discourse in nonsupernatural categories. Attempts to make the two realms of discourse interact systematically, however, have gained limited support in North America and Europe (see RELIGION IN CONFLICT WITH SCIENCE). Businesses, the sciences, medicine, and banking proceed without attempts to negotiate with supernatural forces. Recent attempts to mix theological claims with political goals appear to have increased magical expectations in both church and state.

Belief in Causality. Technology, magic, and religion operate under the assumption that events are caused. The telephone is a product of technology. Telepathy resorts to magic in the sense of positing causal connections that do not exist. In some cases, the line between technology and magic is difficult to draw. Technology progresses by not only keeping careful records of successful predictions, but also recording failures and making physical adjustments.

Among anthropologists, functionalists have argued that magical rituals help a community bond together. In areas of relative desperation where technology and common sense cannot either bring about certain desired events or prevent undesired events, magic becomes symbolic and ritualistic activity that helps the community feel that it has *some* control over events. Performing the prescribed activities provides a sense of bonding and of not being alone. Magic may be seen as an attempt to overcome the sense of futility, weakness, and fatalism. Given that the human race continued for centuries with little or no science, it is understandable that elaborate delusions and erroneous beliefs emerged and thrived. In some respects, magic is to technology what myth is to science. Science began in myth and in the process developed testable theories and hypothesis. Technology began as magical attempts to change events and in the process developed methods for testing, correcting, and improving its attempts.

Some versions of magic are a bet that *words* variously arranged can have a significant impact on whatever forces or beings affect human life. Words may in many cases combine with *bodily movements* that are also believed to be efficacious despite there being no apparent direct contact with the reality to be influenced. In chapter 9 of the book of Exodus, the god Yahweh instructs Moses to stretch out his hand over Egypt. When Moses stretched out his staff, a wind brought in locusts from the east. Earlier in the tale, Pharaoh's magicians and sorcerers use their spells to bring about extraordinary results, including turning a staff into a serpent. The contest between Moses and Pharaoh's magicians continues until Moses wins in chapter 14. The narrator of the tale emphasizes that Yahweh is the real controlling power. Some interpreters see religion as an attempt to remove the magicians' power by giving it to a god who as the conscious, primary casual power selects finite creatures (e.g., a prophet or Balaam's ass) to carry out his purposes.

Belief in Preternatural Agents. Most of the human species has believed in the existence of agents presumed to be either invisible or not visible to the naked eye. The anthropomorphic paradigm spawned an entire cosmic zoo of demons, angels, gods, spirits, and other conscious, purposive agents that caused a range of effects from health and pregnancy to storms, plagues, and earthquakes. Believing that these agents influenced human and natural happenings, our forebears sought ways to negotiate with and influence them. By contrast, the philosopher Democritus conjectured that the world was made up of tiny, constantly moving particles, imperceptible to the senses but indivisible (*atom*) and indestructible. Since no technology existed for testing this theory, it remained dormant for centuries. Alchemy, though largely symbolic and cryptic, evolved eventually into chemistry, which put to rest the belief in the transmutation of elements. The French chemist Louis Pasteur raised medicine to a new level by his experiments with crystals and bacteria. Boiling hot water to sterilize instruments slowly replaced the boiling of heretics. Inoculations in most cases replaced exorcisms. Even though some individuals in North America and Europe profess to believe in demons or the devil, they have revised their expectations. For many contemporary Christians, Satan is viewed as either a deflated myth or an ignored lame duck not worth mentioning.

Fanaticism. Anglican minister and noted sociologist David Martin studied the advantages and disadvantages of the community aspect of religion: "Faith is good for

neighborliness, peace of mind, children's homes, and social ambulance work, bad for peace in the Balkans, the Middle East, India, and parts of Africa." Historically, religions have contributed to both community bridge building and lethal fanaticism. This is largely because religion reflects our common biological propensity to divide ourselves into insiders and outsiders. Apocalyptic thinking develops this propensity into a cosmic dualism with the righteous on one side and the wicked on the other. G. A. WELLS points out that, given our human finitude and diverse backgrounds, we human mortals will continue to have strong disagreements on important matters. Hence, it becomes imperative to cultivate ways to maintain an open society wherein people can cooperate with one another and explore common values. This requires resisting fanaticism's temptation to indulge in intimidation and persecution: "To create this moral approval [of cruelty] it is necessary to define the polluting enemy as nonhuman or inhuman, that is, outside the range of human beings to whom one owes the slightest obligation as fellow creatures. . . . [R]egularized and routinized cruelty may have been the most important contributors to human suffering."

The Soviet and Chinese version of Marxism turned the secular state into totalitarian fanaticism with its own rationalization of torture and dehumanizing cruelty. As Eric Hoffer notes, the adherent of every ideology must deal with the temptation to succumb to fanaticism, to become the true believer at the expense of other believers and unbelievers.

The Impact of Beliefs. Beliefs in the form of theories and conjecture about aspects of the world have a psychological impact. Even beliefs that correspond with no reality are themselves a cultural reality. Erroneous beliefs have exerted a major influence on human history. Human beings build theories and live by them just as beavers build dams and live in them. Beliefs can function in significant ways as instincts or powerful drives. Far from being dispassionate, scientists are driven by the belief that better explanatory theories are possible, that an open exchange of argument and information frees the imagination to invent new and possibly better theories, and that rigorous, severe tests can often expose real and possible flaws in those theories. In short, science is driven by many beliefs, including the expectation of intellectual progress in an environment where freedom is vigilantly protect and cultivated.

JOE EDWARD BARNHART

BELINSKII, VISSARION (1811–1848), Russian critic and radical journalist. Vissarion Belinskii was born into the family of a poor provincial doctor. His grandfather was a priest; his father was known as a "godless one" (*bezbozhnik*), though he may have earned this epithet only because he was rude to his neighbors, drank too much, and did not go to church.

By the age of twenty-one Belinskii had failed to graduate from two different high schools. Even so, he was a gifted student and was admitted to Moscow University on scholarship. After two years of study—and his writing of a play critical of serfdom—he was expelled. The official reason was "an unsound health and limited capabilities." To his radical friends, losing the opportunity to study at Moscow University was no great loss. Belinskii himself recognized later that both his own lack of diligence and poor teaching at the university contributed to his expulsion. Despite the university's dim view of his prospects, Belinskii found work at one of the leading Russian journals as a writer (*literator*) and soon became one of the most influential literary critics in Russia.

By that time he was quite skeptical about his religious beliefs. Throughout his life Belinskii had no stable source of income, and his life was quite miserable. When his mother advised him "to visit all Moscow churches" in order to get support in his life struggle, he replied to her that he had better things to do besides becoming a "devout itinerant pilgrim." By this time Belinskii was soundly under the influence of the German philosophy, especially that of Hegel, but he did not yet criticize traditional religious beliefs. That turning point came in 1842, when his friend Botkin introduced him to Ludwig FEUERBACH.

The only foreign language Belinskii knew was French. However it is reliably attested that friends translated some excerpts from Feuerbach for him, and he was deeply impressed with the German philosopher's ideas. In a letter to the anarchist Mikhail BAKUNIN dated November 28, 1842, Belinskii wrote, "What is a human

being without God? It is a cold body. His life is in God, in Him he dies and rises from the death, suffers and states in bliss. And what is God if not a human *idea* of God?" This sounds clearly Hegelian and indeed bears the stamp of Feuerbach. Still Belinskii did not share his new views with the reading public. Within his circle of friends, he was more open and tried to advocate for his unbelief in God. In his later memoirs, Dostoyevski wrote of a meeting with his friend Belinskii in or around the year 1846: "I found him as a passionate socialist, and he began [discussion] straight from atheism."

Belinskii's most famous statement of his anticlerical and antireligious views is his "Letter to Gogol" dated July 17, 1847. The letter contains open criticism of the Russian Orthodox Church and the official ideology of nineteenth-century Russia. Though published only after the Russian Revolution of 1917, it circulated widely among nineteenth-century Russian radicals as a handwritten document. Possessing or reading the Letter was a crime—for example, it was the crime for which Dostoyevski was initially sentenced to death, subjected to a mock execution, imprisoned, and remanded to compulsory military service. Belinskii wrote in the letter, "Russia sees her salvation not in mysticism or asceticism or pietism, but in the successes of civilization, enlightenment, and humanity. What she needs is not sermons (she had heard enough of them!) or prayers (she had repeated them too often!), but the awakening in the people a sense of their human dignity, lost for so many centuries amid dirt and refuse (*nevolya*); she needs rights and laws conforming not to preaching of the church, but to common sense and justice, and their strict possible observance." The letter expresses a sincere belief in Christ as a social prophet, quite common among social radicals at that time.

Eight months later Belinskii died from tuberculosis.

VLADIMIR SHTINOV

BENNETT, DEROBIGNE MORTIMER (1818–1882), American freethought publisher and editor. D. M. Bennett published FREETHOUGHT literature and philosophical, biographical, and scientific books and pamphlets. Bennett's HUMANISM, iconoclasm, and persecution by Christian zealots earned him mythic stature among unbelievers around the world. Admirers referred to him as "Nature's Nobleman" and the "American VOLTAIRE."

Bennett was an outspoken free-speech advocate who promoted women's rights (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF) and labor reform (see LABOR MOVEMENT AND UNBELIEF). His hard-fought battle against censorship culminated in one of the most publicized and historically significant freedom of the press trials in the United States. Bennett's irreverent "An Open Letter to Jesus Christ" and his incendiary debates with some of America's leading clergymen, which he printed and sold as tracts, infuriated religionists, who called him "the Devil's Own Advocate."

Early Life. Bennett was born on December 23, 1818, in Springfield, New York. At age fifteen he escaped a poverty-stricken family by joining the United Society of Believers in Christ's Second Appearing, commonly known as the Shakers. The Shakers were a strict religious sect and the most enigmatic and successful utopian movement in America. Bennett was a devout member of this celibate communitarian society for thirteen years and worked as an herbalist, physician, and ministry-appointed journalist. Bennett recorded "divinely inspired" messages during the Shakers' decade-long spiritualistic revival period, the Era of Manifestations. When the revival subsided, some of the younger members including Bennett and his future wife, Mary Wicks, began to lose their religious fervor (see SPIRITUALISM AND UNBELIEF). In 1846 Bennett and Wicks eloped.

Soon after leaving the Shakers, Bennett read his first "infidel" publication and subsequently studied the scientific and philosophical works of Charles DARWIN, Thomas Henry HUXLEY, Herbert SPENCER, John Stuart MILL, Voltaire, and Thomas PAINE. It was Paine's *Age of Reason* that converted the former devout Christian to a freethinker and unremitting skeptic.

The Truth Seeker. For the next twenty-seven years the couple moved around the country. Bennett invested in various business ventures, owned drugstores, and successfully marketed his Dr. Bennett's Family Medicines. In 1873, while living in Paris, Illinois, Bennett got into a spirited debate with clergymen over the efficacy of prayer. After the local newspapers refused to print some of his "infidel" letters to the editor, Bennett founded *The TRUTH SEEKER* as an alternative to the Christian-controlled press. The Shaker-turned-freethinker devoted his "little sheet" to "Science, Morals, Freethought and Human Happiness."

Later that year, Bennett moved *The Truth Seeker* to New York City, where it would remain for nearly a century. Within a few years he transformed his prairie monthly into the nation's most influential reform weekly, with fifty thousand readers. Thomas Edison, Samuel Langhorne CLEMENS (Mark Twain), Harry Houdini, and Clarence DARROW were among the illustrious subscribers. *The Truth Seeker* was the official organ of the NATIONAL LIBERAL LEAGUE, an association of freethinkers devoted to complete separation of church and state. Bennett served as vice president along with Robert Green INGERSOLL, the famous agnostic attorney and orator.

A lightning rod for controversy, Bennett was both the most revered *and* the most reviled publisher of the Gilded Age. He was brazen and sweeping in his condemnation of Christianity: "We humbly believe Christianity to be false, to be the greatest sham in the world, without truth in its history, without loveliness in its doctrines, without benefit to the human race, and without anything to sustain it in the hold it has upon the world." Bennett opposed dogmatic religions and took great pride in debunking the Bible and exposing hypocritical clergymen. (He was the first editor in America to routinely

report misdeeds by the clergy, publishing the collected reports as *Sinful Saints and Sensual Shepherds.*) Bennett reminded Americans that the government of the United States was "*not in any sense* founded on the Christian religion" (see TREATY OF TRIPOLI). He argued that Abraham Lincoln and many of the Founding Fathers were, like his hero Thomas Paine, deists or infidels, the most noteworthy being Benjamin FRANKLIN, Thomas JEFFERSON, and George Washington.

In 1877 Bennett became the target of Anthony Comstock, America's self-appointed arbiter of morals (see COMSTOCK, ANTHONY, AND UNBELIEF). Comstock was a "special agent" for the US Post Office and secretary and chief vice hunter for the New York Society for the Suppression of Vice, an organization that was part of the social purity crusade. This self-described "weeder in God's garden" waged war on "obscene" books (including some classic works of literature) and freethinking writers and publishers. Comstock judged Bennett to be "everything vile in blasphemy and infidelity."

Free-Speech Advocacy. Some of the country's most powerful and pious citizens backed Comstock, who bragged about driving fifteen people to suicide in his Christian-sanctioned mission to "save the young" (see CRADDOCK, IDA). There was little protest in the nation's newspapers and magazines against the puritanical and ill-defined Comstock Laws. Like the politicians, most publishers felt that opposing the crusader and his often ballyhooed "fight for the young" might be interpreted as tolerating crime. Censorship and church hypocrisy, however, were two of Bennett's favorite subjects. In Comstock and his "Vice Society" as the editor dubbed it, he found both. While other periodicals occasionally scolded Comstock, Bennett persistently challenged and lampooned "Saint Anthony" and his wealthy sponsors (including Samuel Colgate, the soap tycoon) in books, pamphlets, and countless pages of *The Truth Seeker.* Prominent abolitionists, reformers, and suffragists supported Bennett's "cause" for "free speech, a free press, and mails free from espionage and Comstockism."

"The charge is ostensibly 'obscenity,'" Bennett wrote after being arrested by Anthony Comstock. "But the real offense is that I presume to utter sentiments and opinions in opposition to the views entertained by the Christian Church." Bennett's first arrest was for his "Open Letter to Jesus Christ" and a scientific tract written by a former minister. (The charges were dropped after Ingersoll interceded on Bennett's behalf.) His second arrest was for selling *Cupid's Yokes*, a free-love pamphlet (see SEX RADICALISM AND UNBELIEF) at a freethought convention in Watkins Glen, New York. Bennett was arrested a third time, convicted, and imprisoned for sending *Cupid's Yokes* through the US Mail. Bennett's 1879 obscenity trial was a travesty of justice. The Hicklin rule (an ambiguous common-law "test" for obscenity that permitted work to be judged by introducing only isolated passages without regard for the intention of the author) was used to convict Bennett, and became the obscenity standard in US law until it was overturned in 1957.

Bennett spent almost a year in the Albany Penitentiary, where he nearly died from harsh prison conditions and the stigma attached to selling "obscenity." A petition with more than two hundred thousand names (the largest petition campaign of the nineteenth century) was sent to President Rutherford B. Hayes, asking for a pardon for the elderly editor. Hayes (who, ironically, had earlier pardoned Ezra HEYWOOD, author of *Cupid's Yokes*) also received petitions from Comstock that were signed by religious leaders and Sunday school children. Mrs. Hayes, a pious Christian, adamantly opposed absolving the publisher of *The Truth Seeker.* Hayes denied the pardon, although he would later admit in his diary that *Cupid's Yokes* was not "obscene."

While in jail, Bennett wrote *From behind the Bars: A Series of Letters Written in Prison* (1879) and *The Gods and Religions of Ancient and Modern Times* (1879). Soon after serving his sentence, Bennett traveled to Europe to represent American liberals at the Congress of the Universal Federation of Freethinkers in Brussels, Belgium. In Europe he wrote *An Infidel Abroad*, also titled (to reach a wider audience) *A Truth Seeker in Europe: A Series of Letters Written Home during a Ten Week's Visit* (1881). Bennett traveled abroad a second time and chronicled his trip in a four-volume work, *A Truth Seeker around the World: A Series of Letters Written While Making a Tour of the Globe* (1882). During his yearlong journey (paid for by thousands of supporters) he was given a hero's welcome in numerous cities.

Bennett's Legacy. Bennett died on December 6, 1882, a few months after returning home from abroad. Obituary writers expressed varied opinions. The *New York Times* minimized Bennett's free-speech advocacy, writing that he was a "a pronounced free-thinker" who "obtained some notoriety in 1878 by reason of his arrest upon the charge of sending indecent publications through the mails." Like most "secular" newspapers in the nineteenth century, the *Times* was Christian, conservative, pompous, and essentially a guardian of repressive Victorian morality. Other newspapers characterized him as "the leader of Atheism in the United States" and the "Luther of the nineteenth century." According to the *Dictionary of American Biography*, Bennett was "an amalgam of quack, crank, and idealist" and "an effective popular spokesman for liberal ideas in religion and ethics."

The Truth Seeker continued to provide a forum for freethinkers long after Bennett's death. Although Bennett's significance looms large in the annals of unbelief, his contribution to free speech has yet to be recognized. There have been several celebrated obscenity trials in America, but few if any of the defendants suffered the injustice and severe consequences as the courageous editor of *The Truth Seeker.* "Mr. Bennett was a man wholly extraordinary, and his career was not less so,"

wrote James Parton, the famous nineteenth-century biographer. "He embraced an unpopular cause; he made it less difficult for others to do so."

Two years after D. M. Bennett's death, a thousand friends erected a massive and controversial monument to "the Defender of Liberty and Its Martyr" in New York. The granite memorial, still standing today in Brooklyn's Greenwood Cemetery, is inscribed with Bennett's philosophical principles and the proclamation: "When The Innocent Is Convicted, The Court Is Condemned."

ROD BRADFORD

BENNETT, HENRY SCOTT GILBERT (HARRY SCOTT) (1877–1959), Australian lecturer and organizer. Harry Scott Bennett was the first notable Australian-born freethinker (see FREETHOUGHT) and, despite his controversial views, was a respected figure in Australia, the United States, and New Zealand.

Bennett was born in Chilwell (Geelong), Victoria, Australia, on June 1, 1877, to a freethinking socialist mother (see SOCIALISM AND UNBELIEF). He embraced RATIONALISM and republicanism through Joseph SYMES. While working as a draper's assistant in Melbourne, he was "discovered" by visiting British socialist Tom Mann. With Mann and another British socialist, Henry Hyde (Harry) Champion, Bennett founded the Victorian Socialist League in 1897 and the Victorian Socialist Party (VSP) in 1906. In 1902 he began lecturing for the Political Labor Council (PLC) and was elected to the Victorian Legislative Assembly as the PLC's candidate in 1904. In parliament he spoke for railway workers, miners, the unemployed, and animals, and against corporal punishment in schools, but claimed there were issues that caucus prevented his raising. Probably these included the parochialism and racialism of Australians at the time. So Bennett did not run for reelection in 1907, broke with the PLC, and instead began lecturing for the VSP.

Later that year he went to Sydney to be a mainstay of the International Socialist Club. In 1909 he went to New Zealand to lecture under the auspices of the New Zealand Socialist Party. Bennett supported the Federation of Labor ("Red Feds") but found time for rationalism, and by 1914 was giving weekly freethought addresses in Auckland. In January 1915 he was appointed organizer for the New Zealand Social Democratic Party, but went to the United States in September to lecture for the Rationalist Association of America.

Upon his return to Australia in 1917, Prime Minister Billy Hughes made Bennett an attractive offer to promote enlistment or conscription for the armed forces, but he rejected the offer and opposed conscription during the 1917 referendum. He became a founding member of the Y Club (1918), a sociable "think tank" of what the Melbourne *Age* called "revolutionary conspirators." As organizer of the VSP, he lectured throughout eastern Australia from 1917 to 1920, when he resigned to devote himself to rationalism, briefly in New Zealand, then Victoria again. He was principal lecturer of the Social Science Forum (1935–36) before moving to Sydney as secretary-lecturer of the New South Wales Rationalist Association until his death on May 24, 1959.

DAVID TRIBE

BENTHAM, JEREMY (1748–1832), English philosopher, social reformer, and utilitarian. Jeremy Bentham is perhaps more famous for being dead than being alive. His embalmed body, seated in a chair and dressed in his finest clothes, may still be seen in the main hall of the institution he helped to found, University College London. Like everything else associated with Bentham, there was a practical reason for this—he wished to encourage people to donate their bodies for the good of science, and to take away the stigma (primarily of religious origin) that prevented corpses from being used to further medical knowledge. In an era infamous for grave robbers like the notorious William Burke and William Hare, who sold bodies to surgeons unable to get them any other way, Bentham's gesture, shocking though it may be, was perfectly reasonable.

Bentham is credited with founding the philosophy of utilitarianism (the view that ethical actions should be based upon what would bring about the greatest good for the greatest number). Coming from a family of attorneys, and trained in the law himself at Oxford University, he inherited a large sum of money and was thus not required to practice law as a profession. He had the

luxury, rare for most philosophers, of devoting himself entirely to a life of thought. But his thought was very much action oriented. Bentham was one of the foremost social reformers of his time.

Bentham's most important work of political theory was *An Introduction to the Principles of Morals and Legislation*, published in 1789. In it, he attempted to deduce legal matters not from tradition, natural law concepts, or accepted precedents, but from universal principles of reason. Bentham revived the classic doctrine of Epicureanism (see EPICURUS), arguing that the prime motivating factor for human beings was the desire to minimize pain and maximize pleasure. His "hedonic calculus" was designed to determine which actions would bring about the best results for the general populace. Utility, or usefulness, should be the basis for action. While his work was deemed highly controversial in his native England, it was embraced by the revolutionists in France, who made Bentham an honorary citizen in 1792. Unlike Thomas PAINE, Bentham wisely decided not to venture to Paris to receive his honor. He spent the remainder of his life in his native country, where he fought for such social causes as prison reform (he designed a model jail, called the "panopticon," where prisoners could be viewed at all times); increasing the number of voters by basing eligibility on population rather than wealth; raising the age of factory workers and limiting the number of hours they were required to work; and secularizing public education through opening accessibility to Catholics, Jews, and other nonconformists. On the latter issue, he donated a large sum of money for the founding of University College, the first institution of higher learning in England which was strictly nondenominational.

While never referring to himself as an atheist, it is clear from his writings on religion that Bentham was an unbeliever, as well as a sharp critic of the established churches of his time. Religion, he argued, does not promote the cause of utilitarianism. It usually denies people the right to pursue pleasurable activities, makes a fetish of denial and suffering, and castigates as immoral and evil anyone who dares question its authority. The God of the Bible is a despotic figure who creates human beings for the sole purpose of tormenting them. His 1818 "The Church of England Catechism Explained" is a step-by-step demolition of the absurdities of Anglican doctrines, and his "The Influence of Natural Religion on the Temporal Happiness of Mankind," posthumously published and added to by the jurist George Grote, is a merciless lawyer's brief on the harm which superstition and dogmatism have inflicted upon humankind.

Bentham was a colleague of James Mill, and helped his friend to raise his son John Stuart MILL, who was to further the cause of utilitarianism by distancing it from Bentham's extreme brand of RATIONALISM. J. S. Mill came to feel, ironically enough, that his upbringing was insufficiently hedonistic, as both his father and Bentham had failed to appreciate the importance of emotions and physical pleasures in one's life. Bentham's hedonic calculus—in which pleasures and pains were tallied up based upon such measures as which were most long-lasting, immediate, or ephemeral—proved too crude a formula to capture the richness of human experience. Still, his work advanced the cause of moral reasoning by making it less of an abstract art or theological concern, focusing instead on the concrete question of what will bring about the greatest happiness for all those whose interests will be impacted upon by any given action.

TIMOTHY J. MADIGAN

BERGSON, HENRI (1859–1941), French philosopher. Henri Bergson was born in the same year as John DEWEY and Edmund Husserl. It is noteworthy that this is the same year that Charles DARWIN's *The Origin of Species* appeared (see EVOLUTION AND UNBELIEF), since evolutionary thought was to bear a profound influence on Bergson's philosophical work. Against this background, Bergson entered the Collége de France, where he would write a novel chapter in the history of French philosophical thought.

Bergson's major contribution to philosophy was his theory of duration, first presented in his 1889 doctoral dissertation titled *Essai sur les donnees immediates de la conscience*, translated into English as *Time and Free Will*. This is the most important work of Bergson's early career. Like many of his works to follow, he tackles a philosophical problem by laying out the contemporary landscape, analyzing the conceptual confusions that have caused the problem, and then presenting his solution to the problem in the light of his analysis. For instance, *Time and Free Will* critiques the concept of time as nothing more than a measure of quantitative homogeneous units; he then introduces his theory of time as duration and goes on to show that free will is possible for humans when we realize that psychological motives are not separate atomic states of minds, as held by the associationist school in psychology; rather they involve a heterogeneous interpenetration of psychological qualities so organically interwoven that one's actions issue immediately from the agent. He points out that it is only "after the fact" that our motives are separated and dissected as divisible units, producing the illusion of DETERMINISM, which assumes that all human acts are, at least in theory, predictable events unfolding in accordance with causal laws of nature.

This methodology is applied throughout his works, the idea being that traditional problems of philosophy and related fields of science can be treated by reconsidering the immediate data of experience as durational rather than temporal in the classical Newtonian sense. Duration, Bergson held, is the intuitive awareness of change as an indivisible and continuous succession of events, that are only numerically demarcated as a plurality of "events" after the subject has come to reflect on them, albeit with particular pragmatic interests.

Though Bergson rejected the materialism of his age (see MATERIALISM, PHILOSOPHICAL), especially the version championed by Herbert SPENCER, he studied science meticulously. He believed that scientific data could be understood more fully when one accepts the reality of duration at the core of existence. In this sense Bergson anticipated the twentieth-century school of thought known as process philosophy and greatly influenced the philosophy of, among many others, A. N. Whitehead. For Bergson, the processes of nature are the fundament of reality, and any attempt to tackle metaphysical problems must recognize the reality of change.

In an entry of this brevity, justice cannot be done to the widespread influence Bergson's thought exerted on the intellectual world in the first part of the twentieth century. We can however take an overview of some of the fields he treated in his main works other than *Time and Free Will*.

In his most popular work, *L'Evolution creatrice* (Creative Evolution, 1907), he shows that in biology mechanistic explanations cannot account for the change necessary for the emergence of vital processes. Such explanations, he argues, result from the intrusion of ideas fabricated by pragmatic intelligence that are used as theoretical applications to the growth and development of living forms. His view is often termed *vitalism*, as opposed to mechanism, since it posits an *élan vital* the essence of which is duration. To better understand Bergson's methodology one cannot overlook his influential 1903 essay "Introduction a la metaphysique" (An Introduction to Metaphysics). To briefly summarize this work, composed prior to *Creative Evolution*, Bergson draws a sharp distinction between two ways of knowing a thing: one way is through analysis, the other is through intuition. The goal of analysis is to reduce its objects to elements common with other elements in other objects. Analysis breaks a whole into parts. Further, it uses symbols (words) to reconstruct the object; thus analysis implies reduction into parts and reconstruction back into wholes. But the reconstructed whole is artificial since it depends on the commonality of parts. In the final account the goal of analysis is not truth, but utility and workability of the objects in our surrounding world. Intuition, on the other hand, has truth for its end, and is found in the interior of an object where duration is prominent. It is the preferred method of metaphysics.

Bergson's other works share the same approach and methodology, starting with critique of entrenched contemporary theories and ending with novel insights that shed new light on old philosophical problems. As suggested above, the theory of duration, as opposed to "clock time," is held to reveal the structure of reality. The method of intuition, largely an appeal to overcome ordinary habits of thinking, is the method Bergson uses to disclose process and duration in all strata of existence from matter to life to mind.

One of France's greatest philosophers, Bergson was awarded the Nobel Prize in Literature in 1927. He was not able to accept the award in person due to his severe arthritis, which plagued him until his death in 1941.

LAWRENCE WESTERBY HOWE

BESANT, ANNIE (1847–1933), British freethought activist. Brought up a devout Anglican, Annie Wood was born on October 1, 1847. Her upbringing was genteel and sheltered, though the family had fallen on hard times. While still only twenty, Annie married Frank Besant, a dour and brutish clergyman. Like many young women of her generation, Annie learned the facts of life on her wedding night. Religious doubts soon crept into her life, partly from the behavior of her husband, partly because of the suffering of her infant daughter, Mabel, during an illness. By the time she secured a separation from her husband in 1873, Besant was a convinced freethinker (see FREETHOUGHT). She joined the NATIONAL SECULAR SOCIETY in 1874 and quickly became an active writer and speaker for the freethought movement. In 1877 Besant became coeditor of Charles BRADLAUGH's paper, the *NATIONAL REFORMER*, in recognition of her ability and value to the movement.

Besant soon acquired a nationwide reputation for her defense alongside Bradlaugh of the birth control pamphlet *The Fruits of Philosophy*, written by the American physician Charles KNOWLTON. The discussion in public of birth control (see BIRTH CONTROL AND UNBELIEF) was unheard of, and in 1877 Bradlaugh and Besant were prosecuted for publishing obscene literature and sentenced to six months' imprisonment, but released on a technicality. Although deeply committed to the principle of birth control, neither Bradlaugh nor Besant was uncritically supportive of Knowlton's book. It was the principle of free speech they were concerned to defend, at least as much as the topic at hand. The year after their prosecution, Besant wrote *The Law of Population*, which

she intended to replace Knowlton's work. Besant's achievement was to bring the subject of birth control into the open, and to make its principles available to the general reader.

As a result of the publicity attracted by this case, Frank Besant, who had been granted custody of their son, Digby, was also able to wrest control of Mabel, who had been granted to Annie's care. The courts agreed that Annie's support for birth control proved her unsuitable as a mother. (It is worth noting that later, when they were able to choose for themselves, both children opted to live with their mother.)

Undeterred by these reverses, Annie Besant went on to collaborate with Bradlaugh during his prolonged campaign to take his seat in Parliament. Bradlaugh won the seat of Northampton in 1880, but was soon involved in a protracted struggle over his original refusal to swear his oath of allegiance on the Bible. Over the next six years Bradlaugh was reelected four times by the electors of Northampton before Parliament finally allowed him to take his seat. Besant continued to suffer for her beliefs during this campaign, being subjected to several demeaning persecutions. She was refused leave to use the garden of the Royal Botanic Society, the reason being given that the daughters of the curator used it. And in 1883 Besant was refused admittance to the practical botany classes at University College on grounds of her supposed immorality. During her atheist period (see ATHEISM), Besant wrote some essays that have remained classic popular freethought polemics, which were gathered as a collection titled *My Path to Atheism* (1877).

Besant was also active during these years as a socialist agitator (see SOCIALISM AND UNBELIEF), a trend the liberal and individualist Bradlaugh did not support. Her drift toward socialism reflects the influence of George Bernard SHAW. Besant had joined the Fabian Society in 1885. In 1888 she took a brave stand in support of a group of girls being shamelessly exploited while the company they worked for announced record profits. The girls were employed by Bryant and May to make matches, and the strike became a cause célèbre for the exploitation of labor in England. A year later, and largely on the strength of that success, Shaw invited Besant to contribute an essay to *Fabian Essays on Socialism*, which went on to become very influential in establishing the intellectual credentials of socialism.

But another event from 1889 proved to be even more significant for her long-term future as a leader of the freethought movement. That year Shaw—though other accounts say it was the journalist W. T. Stead—gave Besant a copy of Madame Helena Blavatsky's esoteric work *The Secret Doctrine* to review. To everyone's surprise, she found the work convincing and was converted. Madame Blavatsky claimed to have traveled through Tibet, where wise mahatmas had revealed to her the secrets of life. In fact, THEOSOPHY was an eccentric compendium of ideas drawn from Western mysticism, the newer vogue of spiritualism (see SPIRITUALISM AND UNBELIEF), and the still newer interest in the Asian traditions being brought to light by studies in comparative religion, a discipline then in its infancy. Mysticism bequeathed ideas of the nonpersonal godhead. From spiritualism came the idea of the reality of the unseen and our ability to communicate with it. And from Hinduism came the belief in reincarnation. Theosophy is the parent of all contemporary New Age beliefs.

In February 1890 Besant resigned as vice president of the National Secular Society. By 1896 she was a major leader of the Theosophical movement, which she remained for the rest of her life. Besant argued that her transition to Theosophy was not the volte-face her former colleagues saw it to be. She remained opposed to notions of a personal god, and over her long career in Theosophy she led that movement to deemphasize its supernatural tendencies. This said, Besant claimed fifty earlier reincarnations, from mineral to vegetable and then from a variety of primal beings to HYPATIA and Giordano BRUNO. Her extensive writings became increasingly eccentric as she got older. Her best books from this stage in her life are *The Ancient Wisdom* (1897) and *Esoteric Christianity* (1898). Besant was also, as Bradlaugh had been before her, a staunch supporter of Indian independence. She moved to India in 1893 as part of her deepening interest in Theosophy, and spent most of the last three decades of her life there. In 1907 she became president of the Theosophical Society and, in 1913, the first woman president of the Indian National Congress. It was Besant who bestowed on Mohandas Gandhi the honorific *Mahatma*, or "great soul."

On the negative side, Besant gave close support to fellow Theosophist Charles Leadbetter, whose sexual exploitation of boys in his care provoked widespread outrage and did much to damage the movement. Besant was also party to the exploitation of the Indian youth they named Krishnamurti, whom Besant and Leadbetter were grooming as the future leader of the movement. In 1931, six years after the two proclaimed him the Messiah, Krishnamurti renounced his ties with Theosophy and moved to California, where he had a long and successful career as a public guru. Besant's longest-lasting positive contribution from these later years was her consistent advocacy of Indian independence. She died on September 20, 1933.

BILL COOKE

BIBLICAL CRITICISM. Criticism of scripture—not in the sense of faultfinding, but of serious study undertaken in the way any other ancient manuscript might be studied—can be considered in five major forms: historical criticism, source criticism, form criticism, redaction criticism, and criticism centering on the historical Jesus.

Historical Criticism. Historical criticism of sacred texts may be said to have begun with the determination in 1440 by Lorenzo Valla that the Donation of Constantine, by which the first Christian emperor had supposedly ceded the Papal States to the church in perpetuity, was a pious fraud. This was a harbinger of things to come, and in the next century we begin to see the same sort of scrutiny applied to the central documentation for the imperious claims of the church: the scriptures themselves. The Renaissance humanists including Desiderius ERASMUS, Thomas Cardinal Cajetan, and John Colet insisted that the Bible be interpreted and studied in a fashion no different from that applied to other documents of antiquity then being scrutinized: namely, rationally and in their original historical sense. Martin Luther agreed; he argued for the grammatico-historical method, whereby the biblical text must be studied as any other ancient writing, according to the normal rules of grammar and in historical context. This way he sought to counter the spiritualizing allegory used by the church to import its dogmas into an unsuspecting Bible. Though Luther substituted "*was Christum triebt*" (whatever conveys Christ) for Erasmus's criterion of REASON, and so could never quite refrain from a bit of spiritualizing (especially in the case of the Old Testament), his grammatico-historical method was clearly the precursor to the modern historical-critical method (as James Barr and others have noted).

The sixteenth-century astronomers Andreas Osiander, Nicolaus Copernicus, and Johannes Kepler (whom Luther called "this mad fellow") dared to approach their mapping of the planets and stars apart from biblical cosmology—though to protect himself, Kepler troubled to harmonize the text with his results, claiming he had merely shown the "correct" interpretation of the Bible, what it meant all along, waiting for us to catch up with it. He had freed critical inquiry, by an inch or so at least, from the hegemony of the doctrine of scriptural authority.

Parisian Benedictine Jean Mabillon wrote *Acta Sanctorum* (1668), in which he set forth criteria for determining the actual date and authenticity of ancient documents, a critical element in historical criticism. Another key weapon in the arsenal of criticism was the principle of methodological doubt (see SKEPTICISM) applied to philosophical epistemology (the question of how we know things) by René DESCARTES. It would prove equally indispensable in historical matters, too. Fellow rationalist Baruch SPINOZA did give explicit attention to the Bible, suggesting that it contained no true revelation—none different at any rate from that revealed by human reason—and that the miracles of the Bible were metaphors, expressing the pious tendency to trace all events back to God. He stressed that scripture ought to be studied like any other text and asked why the guardians of orthodoxy feared such scrutiny. "Do they think," asked Spinoza, "that piety can only be maintained through ignorance? If so, they have but a timid trust in scripture."

Richard Simon, determined to vindicate Catholic reliance on tradition, sought to show the inadequacy of the Protestant principle of *Sola Scriptura* ("Scripture alone" as the arbiter of faith and practice) by showing the ambiguity and unreliability of the Bible. He denied that Moses had authored the first five books of the Old Testament, the Pentateuch. Further, he stressed the nature of many biblical books as compilations of traditions gathered long after the events they purported to describe, the corrupt state of the text, and the equivocality of the books' literal sense, such that no doctrine could depend upon it. His efforts were appreciated by his Popish masters as little as those of modernist Alfred Firmin LOISY two centuries later.

John LOCKE introduced another critical principle for the historical endeavor when, as against Descartes and the rationalists (see RATIONALISM), he stressed the historical character of all human knowledge. There are no "innate ideas," but rather all knowledge is a matter of empirical data gathered and processed by inference. Ultimately, then, historical-critical method is simply a special case of general epistemology. Consciousness itself is historical as well, since it is a serial process in history, in the flow of experience. Locke had progressive views on the Bible specifically, as well. He thought the Bible should be interpreted by reason (see his *The Reasonableness of Christianity*, 1695), since the true revelation granted men by their creator was reason. Thus what in the Bible did not accord with reason could be safely rejected. This criterion was uppermost in the minds of deists (see DEISM) like Ethan ALLEN (*Reason: the Only Oracle of Man*, 1784) and Thomas Paine (*The Age of Reason*, 1795) writing about a century after Locke.

Locke felt that the epistolary genre was, strictly speaking, tangential to rational revelation, since the epistles were historically occasioned and thus represented a secondary application of the truth, not a straightforward statement of it. In this he resembled his near contemporary Gotthold LESSING who carved the "ugly ditch," pointing out that "[t]he accidental truths of history can never establish the necessary truths of reason." For Locke, epistles were the former, not the latter. But this

freed him to deal with the epistles in a realistic manner, refusing to take individual verses out of the context of the argument; insisting on reading the letter according to the occasion that called it forth; and seeking after the author's intent, which must have been of such a nature that readers in their day could possibly have made some sense of it.

Lessing, too, made positive contributions to biblical science. He published Hermann Samuel Reimarus's fragments (see below) and probed ancient "reader response" to the Bible as a check on the anachronistic readings of later orthodox theologians. For instance, he noted that the early Jewish Christian sect of the Nazoreans used, of the four gospels, only Matthew; and that they held an "adoptionist" Christology (the view that Jesus was a righteous man adopted by God as his honorary "son"). Lessing suggested that perhaps this was because when read without Trinitarian lenses, Matthew's text permitted only such a Christology.

David HUME, an empiricist following in the train of Locke, made an epochal contribution with his argument against miracles (see MIRACLES, UNBELIEF IN). Though unfairly characterized by later apologists like C. S. Lewis and even genuine historians like Robin George Collingwood as an antisupernaturalist scientific positivist (see POSITIVISM), Hume was actually an early proponent of the principle of analogy. He observed that the universal testimony of mankind (by which, in context, he seems to mean the testimony of our contemporaries) tells us two things. First, we do not observe the occurrence of miracles ourselves. Second, whenever we do hear reports of such things, we sooner or later trace them down to the well-known human tendency to exaggerate, to rumormongering, or to simple error or delusion. Given these facts, it will never be more likely that an ancient or a modern report of a miracle is a fact than that it is a rumor or legend. Hume is not talking about what *can* occur, but rather what *seems* to occur, and what can and cannot be considered as *probably* having occurred.

Within the realm of biblical studies more narrowly drawn, we may trace the development of historical criticism by means of a catalogue of scholarly saints beginning with Johann Salomo Semler, who distinguished between scripture (documents found in the Bible by the mere fact of ecclesiastical decision) and the word of God, which makes us wise unto salvation. Thus freed of a superstitious regard for the text, we may dare to touch the ark; and so Semler called for a commentary on scripture that would be purely scientific, not edifying. Similarly, another eighteenth-century critic, Karl August Gottlob Keil, called for the exegete to think the biblical author's thoughts after him, passing no judgment of truth or falsity, neither criticizing nor apologizing, a purely descriptive treatment.

French physician Jean Astruc about the same time set source criticism (see next section) on its way, delineating four (as he thought, pre-Mosaic) sources in the Pentateuch, identifiable by the different divine names used. Johann Gottfried Eichhorn and Johann David Michaelis wrote the first critical *Introduction to the New Testament* (1750), while Johann Philipp Gabler wrote the first "biblical theology" of the New Testament, a purely descriptive account of what the ancient writers believed, free of the falsifying influence of what modern readers may wish to find there. Gabler and Georg Lorenz Baur first spoke of myth in the New Testament, and Baur embarked on a course of what would later be called demythologizing it.

Hermann Samuel Reimarus's 1778 work *On the True Intention of Jesus and His Disciples* (fragments of which had been published by Lessing) was the first critical life of Jesus. David Friedrich Strauss (*The Life of Jesus Critically Examined*, 1835) would more fully develop both the idea of gospel myth and that of its application to the life of Jesus. He demonstrated in exacting detail the bankruptcy of both orthodox literalism (construing miracles as actual supernatural events) and rationalism (construing miracles as contrived or misunderstood natural occurrences). Strauss showed that the miracle stories are myths and legends characteristic of the ancients.

Barthold Georg Niebuhr wrote the first truly critical history of Rome, employing the methods soon to be applied with dazzling effect to the New Testament by Ferdinand Christian Baur. Niebuhr observed that the historian must first ask what is the evidence, then how good is the evidence, and then seek to make sense of the evidence even where what it tells us is false. Can we discern the *Tendenz* (the tendency or ax-grinding "spin") of the writer? Why is he telling us the falsehood he is telling us? If we can discover this, we will know even more about him and his purpose in writing than he wanted us to know. Baur applied these canons to the history of the early church, realizing that the interpreter must first place each document in its correct historical context. Where is it to be placed along the trajectory of the development of Christian thought? Baur plotted out this process as the antithetical struggle between Paulinist Gentile Christianity and Petrine Jewish Christianity, followed by a period of Catholicizing harmonization. Luke, in his Acts of the Apostles, was shown to have rewritten the history of the church in accord with his later catholicizing agenda.

F. H. Bradley (*The Presuppositions of Critical History*, 1874) wrote in defense of Baur and Strauss. He argued that the historian is not a slave of his sources. He must make himself, as the son of his age, the criterion of what he will accept as historical and reject as legendary or tendentious. What else can he do? He has no recourse except to the observed experience of himself and his contemporaries. We cannot accept a report of a prodigy if it is unparalleled in the experience of anyone we know or unless we can verify it for ourselves. If suddenly we were to verify the occurrence of paranormal phenomena like exorcism or the stigmata, then we could in principle

accept ancient reports of these things, however we might want to explain them. But unless we make our own experience the norm—that is, unless we assume methodologically the uniformity of nature and history—no inference is possible at all. And equally, nothing could be judged more probable than anything else. Our only alternatives would be utter skepticism or utter credulity.

R. G. Collingwood, in his posthumously published *The Idea of History* (1956), reviewed the necessary evolution of history, from a mere compiling and harmonizing of documents as "authorities" whose word about past events is to be believed without question into what he termed "critical history." In the latter, the historian himself has become the authority, his documents mere sources. (Here, as often, Collingwood merely recapitulates Bradley, selling the latter short in the process.) He says that the difference between a precritical historian and a scientific historian is that the former is a mere cut-and-paste compiler, weeding out the lying sources, but simply passing on what the truthful ones tell him. The scientific historian on the other hand is able to use false testimony as genuine evidence anyway (just as Niebuhr did), thinking himself back into the mind-set of the ancient writer so as to discern the tendency or belief that caused him to give us the false statement. It may have been sexist bias, in which case we can use his distortions as evidence in a history of sexism. Again like F. H. Bradley, Collingwood notes that historical reconstruction is largely a matter of causal inference traced between coordinates provided by a set of facts. But the "facts" themselves are established as such by virtue of the historian's judgment. Collingwood says that the criterion the historian uses is a general picture of the past, a paradigm that he both infers from the evidence and uses to make fuller sense of the evidence.

Van A. Harvey (*The Historian and the Believer*, 1972) set himself the task of vindicating Ernst Troeltsch's three principles of criticism (no historical judgment can ever be any more than probable and provisional), analogy (the experience of the past must be assumed to be not radically different from that observed today), and correlation (events are to be set in a sequence of cause and effect and historical conditioning) against the charges of theological apologists that the three principles are the function of arbitrary "naturalistic presuppositions," for example, the philosophical exclusion of the very possibility of miracles. Harvey shows that this is not so. First he shows that there is not one unique type of "historical" judgment call; rather, the field of historical study encompasses various different logical fields of argument in which very different bodies of data, warrants for conclusions inferred from the data, challenges to warrants, rebuttals, and the like, function. The historian must deal with them all. Each warrant appropriate to the evaluation of a particular historical claim is in turn based on certain truisms, generalizations about what everyone recognizes as the truth, what the burden of proof would be on one to deny. Thus no universal laws of nature or anything else are called upon. Nor need they be, since the historian is not a clairvoyant in reverse, dogmatizing on what happened. Rather he is merely inferring what *would* have happened in the past, "all things being equal." The name of the game is probability. As F. C. Baur said, Anything is possible, but what is probable? The real problem for apologists is not the use of a dogmatic presupposition by critics (that miracles can't happen) but rather their lack of one (the believer's presupposition that scripture is factually inerrant). Only so can we explain the special pleading in which the apologists indulge.

Source Criticism. Source criticism disputes both traditional ascriptions of authorship and the literary integrity of the books of the Bible. The first major bombshell dropped by source critics (the greatest of whom was Julius Wellhausen) was that the Pentateuch (first five books, the Torah proper) was not written by Moses, something that ought to be obvious from the fact that the narration several times refers to conditions long after the time of Moses (Gen. 36:40–43; Exod. 12:6), who is already regarded as an ancient figure even in Deuteronomy (34:6,10). Rather, the Pentateuch is a compilation of earlier narrative and legal sources probably assembled in the fifth century BCE or later: collections of legends and laws. It is fairly simple to tell the sources apart, even in English translation, once one knows what to look for.

The earliest of these underlying documents, as well as the most stylistically beautiful, is the J source, so called because it uses the name Yahve (or Yahweh, or Jehovah represented in English Bibles as "LORD" or "GOD") the whole way through, and it is a collection of material from the southern Hebrew kingdom, Judah (Yehudah). (German scholars discovered all this, and Germans pronounce *J* like our English *Y*.) J gives us raw mythology unretouched (Yahve often appears as a character on stage)—entertaining portraits of biblical characters not yet "sanitized" as holy saints. J is anachronistic, paying little attention to when various laws actually began to be observed in Israel, sometimes describing the ancients as if they followed the customs of J's own day. J's story begins with the creation (the Garden of Eden story, Gen. 2:4b–chap. 3) and continues on through Moses. J may have compiled his epic, at the earliest, in Rehoboam's reign (just after Solomon), but it may even date to as late as post-Exilic times.

The second source is a collection of similar materials, the E source, so called because it calls the deity Elohim ("God") until the burning bush story (Exod. 3:13–16), after which it adds "Yahve." It was a collection of stories from the northern Hebrew kingdom, Israel or Ephraim. E is more conservative in its depiction of God, having him speak from offstage in dreams or visions. It also tries to clean up the faults of the characters, as we can see by comparing the J and E versions of the same story

(Gen. 16 [J] vs. 21 [E]; 12:10–20 [J] vs. 20 [E]). E begins with Abraham and extends through Moses. E is later than J and may come from the ninth century—the dawn of the prophets—since it calls Abraham a prophet. But it may date from much later.

The third source is D, the basis of the Book of Deuteronomy, consisting of the sermons fictively ascribed to Moses from chapters 4 through 34. Though it seems to incorporate sermonic material from the old Shiloh shrine in the north, this book was put together by prophets and priests (Hilkiah, Huldah, Jeremiah?) in the seventh century BCE. Someone later added a historical preface (Deut. 1–3), a summary of the Moses/Exodus sections of J and E, already combined.

Like D, the fourth source is mainly a vast law code, or a set of them—called P, or the Priestly Code—compiled by the exiled Jewish priests while in Babylon in the sixth century BCE. It contains the sketchiest summary of Israelite history, beginning with the six-day Creation (Gen. 1:1–2:4a) and going on through Moses. The Creation, Flood, and Moses stories are told at some length. But by far most of P is legal materials. We do not know to what extent these were actual laws that governed Israel and Judah, or whether they may have been an ideal blueprint like Plato's *Republic* or Thomas More's *Utopia*.

Source-critical study also disclosed to the satisfaction of all but fundamentalist apologists the late and multiple authorship of Isaiah, Daniel, Ezekiel, Zechariah, and Job, as well as the gospels (Matthew and Luke both having rewritten the earlier Q source [see below] and the Gospel of Mark) and the epistles, especially 2 Corinthians.

Form Criticism. Form criticism (*formgeschichte*), or form history, appeared in biblical studies in the work of Hermann Gunkel. He pointed out, as against Julius Wellhausen, whose source analysis he accepted in broad outline, that the J and E sources were not the work of writers in any modern sense, but rather of collectors and compilers of ancient oral traditions, which they modified very little except for writing them down. Gunkel picked out five major types of stories/legends in Genesis, though we find many of them throughout the Bible. They are differentiated according to what question the ancients were seeking to answer in a prescientific yet ingenious and inventive way.

Etiological stories are narrative attempts to explain why remarkable things are the way they are: how they came about. Why is there death (Gen. 3:19)? Why do we wear clothes (Gen. 3:7)? Why must we work for a living (Gen. 3:17–19a)? Why do people hate snakes (Gen. 3:14–15)? What is the rainbow (Gen. 9:12-17)? Why do spiders spin webs (see the Greek myth of Arachne the seamstress)?

Etymological stories seek to explain, by means of puns, the supposed origins of names no one understood anymore, or that had unsavory pagan origins and needed a more wholesome Hebrew explanation. Such fanciful name origins are supplied for Moses (Exod. 2:10), Cain (Gen. 4:1), Jerubbaal (Judg. 6:32), Ishmael (Gen. 16:11), Isaac (Gen. 21:3–16), Jacob (Gen. 25:26), Perez (Gen. 38:29), and many others, as well as for sacred places like Beer-lahai-roi (Gen. 16:13–14) and Bethel (Gen. 28:17–18).

Ethnological stories depict the relations of nations, tribes, groups existing in the narrator's day—symbolizing each group as a fictive ancestor who has the stereotype traits of the group. Why do the Israelites and the Edomites always fight, despite being neighbors and even kin? Because Esau and Jacob got off to a bad start (Gen. 27:1–41), and now it's in the blood. What justified Israelite intermarriage with Philistines and their joint subjugation of the Canaanites? Noah's prophetic curse (Gen. 9:20–27).

Geological stories explain the origin of remarkable features of the landscape, whether oases (Exod. 17:6), springs (Judg. 15:18–19), wind-eroded rock formations, man-made cairns (Gen. 31:44–54; Joshua 4:1–7; 7:25–26), glacial megaliths, and so on. The most famous is the salinization of Mrs. Lot (Gen. 19:26).

Ceremonial stories are told to supply a rationale for performing some ritual or custom that was either so archaic that no one remembered why it was first done, or else pagan in origin and thus requiring a new "orthodox" rationale. The Passover story (Exod. 12:21–27), that of Jacob wrestling with a god (Gen. 32:13–31, accounting for a dietary taboo), God attacking the uncircumcised Moses (Exod. 4:24–26, justifying the changeover from puberty to infancy circumcision), and many others are of this type. Most of the stories of Moses and Israel in the wilderness establish ceremonial and legal precedents.

To these five we might add another, suggested by anthropologist Bronislaw Malinowski: *Legitimization stories*. In order to reinforce a society's laws and customs, a story tells how, at the dawn of creation, God or the gods decreed that it be this way. Who are we to change it now? Of course, the story is told after human beings have created the custom, not before. The subordination of women to men in Eden is a prime example.

Many biblical stories fall into more than one of these categories, doing double or triple duty to answer many questions. Perhaps the stories grew in the telling, as each telling prompted new questions from the audience.

Form criticism also allowed the first intelligible reading of the Psalms, placing them as the lyrics of various kinds of laments, hymns, petitions, and ceremonial songs to be performed by the king and the Levitical choristers in the Jerusalem temple.

This approach passed over into New Testament studies once Karl Ludwig Schmidt demonstrated that the chronology of the Gospel of Mark was wholly artificial, and had served merely as a skeleton on which to arrange various individual, originally independent oral traditions. Previously scholars had relied heavily upon the Markan outline for their highly imaginative "lives of Jesus." Now that prop was kicked away. The most important work in

the field was immediately undertaken by Rudolf Karl Bultmann (*History of the Synoptic Tradition*, 1921), Martin Dibelius (*From Tradition to Gospel*, 1933), and Vincent Taylor (*Formation of the Gospel Tradition*, 1935). The main premise governing all gospel form criticism (and one which seems to survive the controversies discussed below) is that the gospel tradition was passed down orally in the form of separate units, streamlined in transmission. Nothing was preserved that did not have a practical (theological, polemical, liturgical, etc.) use. Within a specific *pericope* (a unit of material such as an individual miracle story, aphorism, parable, and the like), no detail was preserved unless it met some need, served some purpose. Further, each specific form had a set function. For instance, genealogies (Matt. 1:1–17; Luke 3:23–38) serve to legitimate, in this case, Jesus's Messianic lineage (just as those in 1 Chronicles serve as pedigrees for priestly families). The result of all this is that the form critic's task is to creatively reconstruct the *Sitz-im-Leben* (the socioreligious matrix in which each piece of tradition was preserved or created by the early community).

Pronouncement stories (Taylor) or *paradigms* (Dibelius) or *apophthegms* (Bultmann, using the term conventional in the study of such anecdotes told of the Greek philosophers) are brief tales that issue in a memorable saying ("pronouncement") of Jesus. Only enough is told to provide an interpretive context for the saying, and the stories likely arose in order to interpret originally unattached sayings. Dibelius thought these stories were sermon illustrations ("paradigms"). More likely they were used in intra-Christian polemic over the issues treated in them such as Sabbath observance rules. Should we pick grain (Mark 2:23–28), heal (Mark 1–5), or carry mats (Mark 2:1–12) on the Sabbath? Must we pay the two-drachma tax (Matt. 17:24–27)? *Aphorisms* serve much the same purpose, but may also be used simply as proverbs to guide one's conduct. These are like pronouncement stories, only with no story attached.

Miracle stories were probably used as evangelistic propaganda to create faith in the divine savior, much as the testimonials of the miracles of the Hellenistic healing god Asclepius were posted for perusal at the shrine of Epidauros. But the third-century CE church father Origen gives us an important clue as to the function of the healing and exorcism stories, when he tells us that in his day they were read on the occasion of attempted exorcisms and healings. Dibelius had surmised as much. The research of Claude Lévi-Strauss on healing chants among the Kuna, and of Raphael Patai on medieval exorcism stories, would confirm the same. The preservation of the magical techniques used by Jesus, as well as his exact Aramaic words (Mark 5:41; 7:34) is thus explained: the would-be Christian exorcist/healer wanted to ape Jesus as exactly as possible.

Law words are legislation for the early church on various topics on which it had come to differ from Judaism. Many are simply given in didactic form, some of these to be found in Matthew 18–19. Others must be identified as such by subject, since as to form they are pronouncement stories. They may also be garnished with scripture citations (as the story about plucking grain on the Sabbath) or with a rule miracle (as Gerd Thiessen calls them in his *The Miracle Stories of the Early Christian Tradition*, 1983), as in the story where Jesus proves the community's right to pronounce forgiveness of sins when he heals the paralytic lowered through the thatching. The tradition also abounds in *wisdom sayings*, Christological "*Ich-wörter*" ("I" sayings—portentous self-revelations, as of a hitherto incognito god), *prophecies* of Roman conquest, *apocalyptic predictions* of the coming of the Son of Man and the Kingdom of God, and the like.

Some of the presuppositions of the earliest form critics (perhaps Bultmann rather less than the rest) have come under fire in recent years from Eberhardt Güttgemanns (*Candid Questions concerning Gospel Form Criticism*, 1970) and others. Güttgemanns and Ulrich Wilckens assailed Dibelius's assumption that the forms, especially the paradigms, originated as either preaching texts or sermon illustrations. Dibelius thought that Acts preserved what Luke intended as models for Christian preaching drawn from traditions of the preaching of the apostles. Though Dibelius (see his collection *Studies in the Acts of the Apostles*, 1956) knew better than anyone else that the sermons were anything but transcripts, he thought they represented the general *kind* of thing once preached. But Wilckens pointed out that even if this were so, and it probably was not, these so-called sermons do not in fact use paradigms and scarcely hint of miracles in any more than general terms. No, Dibelius had unwittingly smuggled the modern Lutheran preaching he heard in church back into the gospels. (For his part, Bultmann had already expressed doubt as to this Dibelian axiom.)

Pressing on further, Güttgemanns denied the common form-critical assumption that the gospel materials ultimately stemmed from the earliest preaching of the death and resurrection of the Son of God. Dibelius was no doubt correct that the materials are thoroughly religious propaganda, not products of historical research, but he never demonstrated how any of them, outside of the Passion narrative, had anything to do with the *kerygma* (the early Christian message). What did exorcisms, law words, walking on the water, and the like, have to do with the kind of thing we read in 1 Corinthians 15:1–11? Paul needed miracles so little that he never mentions them. The same is true with the teachings of the Risen One, with one or two possible exceptions.

C. H. Dodd (*The Apostolic Preaching and Its Developments*, 1935) had already tried to clarify things by distinguishing the *kerygma* (in his model, the saving message of the cross and resurrection) from the *didache* (subsequent catechism on secondary matters), but this was only to concede that most of the material had nothing really to do with the allegedly all-important *kerygma*. Certainly Ernst Käsemann, Bultmann's dis-

ciple, was off target with his claim that the rest of the tradition was necessary to keep the *kerygma* from fading into Docetism (the denial that Jesus had ever assumed a fleshly body). Was Paul, who wrote of the risen Christ but scarcely ever of the man Jesus, then a Docetist?

Recently, Burton L. Mack (*A Myth of Innocence*, 1988) has taken this insight much farther, indeed to its logical conclusion. For the material that seems unconcerned or ignorant of a *kerygma* of a dead and risen Christ we must postulate a religious community in which these supposed events were either unknown or unimportant. Whatever community compiled the Q-source of sayings (the sayings common to Luke and Matthew, but not Mark) must have been unconcerned with Jesus's supposed atonement and resurrection, since Q makes no reference to these things. The Q community, therefore, would perhaps have denied them had they heard of them. Conversely, the *kerygma* belonged to the Christ Cult, which venerated a Christ analogous to the shadowy *Kurioi* ("Lords," saviors and demigods) of the Hellenistic mystery religions.

Dibelius and Gunkel had been much influenced by the theories of Johann Gottfried von HERDER on folklore and folk poetry. Herder had maintained that such poetry stemmed from a primitive *Volk* lacking either artistic sophistication or any polemical ax to grind. This was all of a piece with Rousseau's popular "noble savage" idea. Artistic craft was seen as a poor substitute for the authentic poetic inspiration of the pristine and unspoiled, because unsophisticated, *Volk*. In Dibelius this translated into the convenient notion that the early gospel material (paradigms and paradigmatic miracle stories) came fresh from the collective matrix of "the early community," a blessed band innocent of both contrived artistry and ax grinding. Their simplicity was a mark and a proof at once of historical truth and of naive poetic beauty. And, just as Herder thought the unspoiled poetic consciousness of the *Volk* was transparent to God, Dibelius put the historical Jesus in God's place. Form critic Vincent Taylor, more of a rationalist and an apologist, sought to buttress the case for gospel authenticity by in effect placing the apostles and eyewitnesses as guards at the tomb of the tradition, guaranteeing that the fancy-flights of the early community did not carry off the truth about the historical Jesus. But, as Güttgemanns shows, the fantasy of the poetic *Volk* was soon seen in wider literary circles for what it was: the product of Herder's Romantic sentimentality. Again, we have Mack to thank for a consistent application of this insight. He shows us that the artistry of any pericope is evidence for a highly sophisticated and intentional crafting by educated people. The apophthegms, far from being simple recollections by the pristine Galilean peasants, were more likely the products of a school exercise to show how well one had grasped the thought of an important figure. Hellenistic students were educated in the art of creating appropriate sayings to attribute to philosophers they studied.

Can we determine the authentic words of Jesus? Bultmann thought this improbable, indeed nearly impossible. But in light of research into oral tradition as it functions today, it is rather simply out of the question given the nature of the case. Homer scholar Albert B. Lord (*The Singer of Tales*, 1960) recorded oral recitations of epics by Balkan singers, and he showed that each such recitation, especially with any innovations it incorporates, is intended and must be appreciated as a new "original," each performance having its own integrity. Similarly, no reviewer thinks one judges the merits of the various screen versions of *Hamlet* simply by virtue of how many of William Shakespeare's words have been left unchanged or left out. That is the whole idea of an adaptation or, in music, of a new arrangement. To seek the "original words" of Jesus is to make nonsense of the tradition as we now have it, to interpret it against its own intent. The early form critics were guilty of the logocentric fallacy, seeking some true original intent as if it hovered like a ghost at a seance somewhere above the extant versions. As anthropologist Jan Vansina (*Oral Tradition as History*, 1985) shows, the very notion of an original version when we are talking about oral literature is itself highly questionable.

Form critics like Dibelius and Joachim Jeremias (*The Parables of Jesus*, 1954) underestimated the extent to which oral transmission is a process of incremental evolution. A particular pronouncement story or miracle story is like a biological species: it didn't just appear full-blown one morning. Rather, so many little changes accumulated over time that eventually it was a whole new beast. Even so, we must suppose that individual motifs, themes, details, and so on, gradually were added and dropped out, until one story turned into another. And we cannot know where the process began. What was the first form of the Prodigal Son story? Well, what was the first bird? The Pteranodon? It had wings. Archaeopteryx? It had feathers. Or do you want to wait until the eagle? It's all arbitrary.

Vansina shows that oral transmission need not proceed along the kind of unidirectional, linear trajectory that Jeremias thought he could chart. A piece of tradition may well double back on itself; interact with written versions before it returns to orality; or be cross-fertilized with other tellings, harmonizing details as it goes. The process might be compared to textual transmission/corruption of biblical manuscripts. Our only hope of straightening out the whole mess is to have plenty of manuscript evidence to work with, and with the *pericopae* of the gospels, that is precisely what we do not have in most cases. Güttgemanns attacked the form-critical insistence that the compilation of the gospels in written form was merely the extension of the same oral tradition process, a further step on the same trajectory. Güttgemanns showed from Lord's research how the stage of writing down must have occasioned a fundamental change in the hitherto oral material (on this see further Werner Kelber, *The Oral and the Written Gospel*, 1983).

Güttgemanns argues that the critics were wrong in denying any authorial role to the Synoptic collectors, making them out to be cut-and-paste editors, a myopia that resulted in the ridiculous spectacle of critics seeking a traditional basis for obviously redactional items like the Markan Passion predictions (Mark 8:31; 9:12, 31; 10:33–34). No, shortsightedness like this only stops us from seeing the forest for the trees. The gospels *as wholes* could not be understood until the advent of redaction criticism, and later of literary, narrative criticism.

Redaction Criticism. Redaction criticism takes up where form criticism left off. It focuses on the designed and tendentious alteration of their source material by the evangelists. The science of *Redactionsgeschichte* was pioneered by Willi Marxsen (*Mark the Evangelist*, 1969); Hans Conzelmann (*The Theology of Saint Luke*, 1960); and Günther Bornkamm, Gerhard Barth, and Hans Joachim Held (*Tradition and Interpretation in Matthew*, 1963). The method of redaction criticism differs as to whether one has the redactor's sources available for comparison. If we do, then redaction criticism proceeds directly from source criticism, as when we compare either Matthew or Luke with their sources: Mark and the reconstructed Q. If we do not have the prior source in any independent form, then redaction criticism works on the basis of form criticism, together with a few other tricks. For example, we may try to reconstruct what Mark did to his source material by trying to recognize the original outlines of the pericopae he had to work with from tradition. A classic example would be Wilhelm Wrede's *The Messianic Secret* (1901). His work preceded form and redaction criticism, but anticipated the results of both. He could see that the secrecy theme ill fit most of the texts upon which Mark seems to have imposed it, the clearest being the resurrection of Jairus's daughter. From a form-critical standpoint we would expect the story to end with an acclamation of the miracle worker, which is what we do usually find, even elsewhere in Mark (e.g., 1:27; 2:1; 4:41; 6:51; 7:37). But instead, here (Mark 5:43) Jesus sternly warns the parents to tell no one—even though the house is circled by mourners who know their daughter is dead! Is she to grow up confined to her room in order to maintain the pretense that she's dead?

Wrede noticed a recurrent pattern of such silencings (Mark 1:25, 34, 44; 3:12; 4:11–12; 7:36; 8:26, 30; 9:9) and decided that Mark had been anything but a simple compiler. Rather, he had rewritten the whole story in order to harmonize two conceptions of Christology: Had Jesus only been made Messiah upon his resurrection (Rom. 1:3–4; Acts 2:36; 13:33)? Or had he been Messiah during his whole ministry, ever since the baptism? Both! Mark has Jesus become Messiah at the baptism (Mark 1:11), yet keep it hidden until the Resurrection (Mark 9:7, 9), so that most only became aware of the fact then, understandably to infer that only then was he entering into messiahship.

Sometimes the redaction critic must be on the lookout for "redactional seams" that seem to hint at editorial work on material he can no longer compare with the final product. These include abrupt discontinuities, as when Jesus's prediction of his resurrection at the Last Supper in Mark (14:28) seems to go unheard as Peter responds (14:29) to what Jesus had said immediately *before* (14:27). No doubt Mark added the prediction. Another obvious type of seam is the repetition of a sentence after an apparently interruptive digression, as if the redactor, after adding new material, felt the need to duplicate the hook on which the ensuing text originally hung (e.g., 2 Cor. 6:13; 7:2).

Perhaps the greatest systematic use of redaction criticism is the work of Conzelmann on Luke, focusing on Luke's redaction of the eschatological teaching in Mark. In several places Luke has toned down Mark's imminent expectation of the end of the age, in others eliminating it altogether. Gone is the initial proclamation of Jesus entering Galilee: "The time is fulfilled. The Kingdom of God is at hand" (from Mark 1:15). Luke replaces it with the Nazareth sermon (Luke 4:16–30), transferred from a later point in Mark (6:1–6), as even its Lukan context shows by its reference to previous miracles in Capernaum (Luke 4:4–23), which cannot have yet occurred in Luke's timeline. After the confession of Peter, Mark had Jesus promise that at least some of the disciples would live to see the Kingdom of God come "in power" (Mark 9:1), a phrase which often in the New Testament denotes eschatological (end-time) resurrection (Romans 1:4; 1 Cor. 15:43; Mark 6:14). But since all the twelve are now sleeping beneath the sod, Luke 9:27 omits "in power" to leave room for some metaphorical or other invisible mode of the arrival of the kingdom.

At the Sanhedrin trial, Mark had Jesus promise his accusers that "[y]ou will see the Son of Man sitting at the right hand of power and coming with the clouds of heaven" (14:62). But in Luke's time the Sanhedrin members are dead without exception, so he has Jesus say to them, "From now on the Son of Man will be seated at the right hand of the power of God" (Luke 22:69)—nothing about anyone seeing him. In the Olivet Discourse, Mark (13:6) had Jesus predict pseudoprophets who falsely announce "I am he!" But Luke (21:8) adds to their falsehoods something that was true for Mark's Jesus, namely, "The time is at hand!" In the same context, Mark had Jesus predict the fall of Jerusalem and the temple in a lurid apocalyptic cipher derived from Daniel (9:27; 11:31; 12:11): "the abomination of desolation" (Mark 13:14). But the antiapocalyptic Luke does not want the destruction of the temple to be seen as a portent of an immediate end (since in fact it wasn't!), so he historicizes the event, making overt references to Roman siege tactics (Luke 21:20). If Josephus made Vespasian into the Christ, Luke at least absolved Titus of being the Antichrist! And so little can the events of 70 CE presage

the end that Luke inserts into the discourse a new dispensation, "the times of the Gentiles," which must be fulfilled before the end can be near (21:24). Into this compartment he will place the whole of the Acts and any future history as well.

But this is not enough for Luke. Into his narrative he places no less than three strategic questions intended to explode the notion of the soon-coming kingdom, a fanatical view he knows some readers still hold. In Luke 17:20 Jesus is "asked by the Pharisees when the Kingdom of God was coming." This question thus throws the following saying into new perspective as a denial of any calculability or temporality of the coming of the End: "The Kingdom of God is not coming with observation, nor will they say, 'Lo, here it is!' or 'Lo, there!' But the Kingdom of God is within you/in your midst."

Again, in Luke 19:11–27 Jesus is made to tell the parable of the Minas (in Matt. 25:14–30, the Talents) in order to deflate the mistaken notion that "the Kingdom of God was to appear immediately" (v. 11), and the parable is expanded to include the episode of a lord going away to receive kingly authority. He must make a *long* journey and thus will be gone a *long* time, so his return as king surely cannot be soon.

Third, in Acts 1:6, the disciples, apparently none the wiser after a full forty days of presumably juicy post-Resurrection revelations, are still dumb enough to ask, "Lord, will you at this time restore the kingdom to Israel?" He replies by both temporizing and spiritualizing the kingdom: "It is not for you to know the times and seasons the Father has fixed by his own authority, but you will receive power when the Holy Spirit is come upon you."

Discerning patterns like these, Conzelmann was able to postulate a unique historical interest for Luke. Luke did not think Christians ought to wait for an *eschaton* that had already been embarrassingly delayed more than once. Picking up certain other hints, Conzelmann was able to construct a Lukan periodization of history that made room for an ongoing age of the church in which he himself stood and sought to do constructive work. First, Luke prefaces the story of Jesus with sections on John's and Jesus's nativities, which are closely modeled on Old Testament accounts of the birth of Samuel and his recognition by Eli (1 Sam. 1–3). Eli's place is taken here by Simeon and Anna, who embody the previous Old Testament dispensation, the time of Israel. This period will continue petering out till the appearance of John the Baptist, whom Luke robs of his Markan position as the apocalyptic Elijah-prophet, relegating him to a mere pre-Christian prophet, albeit the last in the series: "The Law and the Prophets prophesied until John; since then the Kingdom of Heaven is evangelized." So the "middle of time" (Conzelmann's original title for this book) begins, the time of Jesus, a Satan-free period of ideal fellowship with God's Messiah. Once Jesus banishes Satan in the wilderness, the tempter departs "until an opportune time" should present itself (Luke 4:13), which it does at Gethsemane (hence no "get behind me Satan" rebuke in Luke's version of the confession of Peter, 9:18–21). The disciples may travel and preach the news of the Kingdom without fear of persecution or molestation. But this is over at the Last Supper, when Jesus recalls those halcyon days: "Remember when I sent you out without provisions? Did you lack anything? I thought not. But now I tell you, if you lack a sword, go sell your cloak and buy one" (Luke 22:35–36). Hard times ahead! The middle of time will end, and even as Jesus speaks these words they are being fulfilled, as the Satan-possessed Judas leads the temple police to arrest Jesus.

But the period of the church dawns bright and sunny on Easter when at the end of the gospel and the start of Acts Jesus gives the disciples their marching orders (take the Gospel to Galilee, Samaria, and Rome—the ground plan of Acts) before he ascends to heaven from whence he may occasionally be seen by the likes of Stephen (Acts 7:55) and Paul (Acts 9:4–5; 22:17–21) during the time of the church. Parenthetically, it is significant that this schematization extends even to the exclusion of the latecomer Paul from the ranks of the apostles, since to qualify for that select college one must have been present with Jesus during the whole of the middle of time (Acts 1:21–22). Those who were functioned much as they do in Irenaeus, as guarantors of the doctrine traced by their supposed successors, the bishops, to that golden time (Acts 10:39; 13:31).

The Historical Jesus. As already anticipated, these critical methodologies have been honed as tools for the task of rediscovering the historical Jesus (see JESUS, HISTORICITY OF). Why has this search gone on for so long, and with such mixed and negligible results? Our difficulties stem from the state and character of the evidence for Jesus, or what at first appears to be such evidence. We have four canonical—and more noncanonical—gospels, which, insofar as they agree in any detail, seem to be mutually interdependent rather than serving as multiple witnesses. And insofar as they disagree, they seem to wildly contradict one another. Any semblance of a coherent unity is a dogmatic synthesis imposed on the texts by centuries of harmonization of the canonical four and suppression of the others. Add to this fact that we have no early material, so far as we know. No source definitely attests that the canonical gospels existed until Irenaeus, late in the second century. Even if we knew we had early sources, they are based on floating oral tradition which transmogrifies as often as it gets repeated; the more often it seems to have been repeated, the more luridly it is embellished. The accounts could have changed many times within weeks of the events, let alone years. And how much more so when we are dealing with reports of supposed miracles? Recent psychological research has demonstrated that eyewitness memory is at its most unreliable when it comes to extraordinary events.

Many sayings and stories in the gospels so closely mirror similar materials to be found among the fund of Rabbinic and Hellenistic lore that we must assume that some of each has ended up attributed to the other, and it is now impossible to trace the direction or the extent of influence. However, Christian borrowing from pagan and Jewish sources is more probable in the nature of the case, and likely to be more extensive. This is simply because Christianity is the younger phenomenon, hence more likely the recipient of converts from its rivals than a contributor of them to its rivals. New converts must have brought with them their cherished myths and sayings, now attributed to their new savior. Anachronisms such as the frequent presence of Pharisees in Galilee in the 20s CE shake our confidence further.

Many sayings are clearly tendentious, obviously made to order to settle some later church dispute, such as the unequivocal Great Commission aimed at settling the vexing question of the Gentile mission long after Jesus (an end also served by those stories where Jesus reluctantly heals the children of Gentiles, code for the Gentile mission bringing Jesus to Gentiles in the subsequent generation). Or: "Think not that I have come to abolish the Law and the Prophets. I have not come to abolish them but to fulfill them" (Matt. 5:17–19). This looks back on the life of Jesus in such a way (as do all the "I came to . . ." or "The Son of Man came to . . ." sayings) as to sum up his whole historical career. And it is manifestly an intended corrective to a libertine opinion held by radical Paulinists, a party of Christians who say Jesus "came to" do away with the law.

Though critics and historians have invented various criteria to help us arrive at what Jesus did or said, they are of little help. Not only do they present us with wildly varying results, but their criteria cancel one another out. Norman Perrin calls one of these widely used canons, used also by Bultmann and others, the criterion of dissimilarity. That is, we can be pretty sure that a saying goes back to Jesus only if it does not too closely mirror the belief or practice of either the early church (for otherwise the church belief may have been retrojected onto Jesus) or that of contemporary Judaism (for otherwise it may have been Jewish in origin and attributed to Jesus later). Perrin's caveats are quite well founded, but they leave us with near-total skepticism. This is because the criterion of dissimilarity runs afoul of the central axiom of form criticism: that nothing, nothing at all, was transmitted unless it represented the usage of some quarter of the church. This, too, is likely to be true. But then it means nothing at all can be safely traced back to Jesus. Does Mark 2:16ff. tell us *not* to fast, while Matthew 6:16ff. tells us *how* to fast? We must assume that each represents the praxis of a different faction within the church.

James Breech speaks of the criterion of embarrassment, a good new name for a well-worn tool. John Dominic Crossan calls it "theological damage control"—even better. If an item embarrassed the church, the church could hardly have created it. But this ignores the fact that what was embarrassing to one generation or sector of the church was not embarrassing to another. As apologist John Warwick Montgomery once quipped, everything Jesus said offended *somebody* in the early church! Matthew and Luke found the spittle magic of Jesus in Mark to be embarrassing, but that need not mean that Mark was right in having Jesus do it. It may be that earlier Christians, casting out spirits in the name of their cult deity Jesus, created stories which attributed to him the current conventions of exorcism.

Does Mark 12:35ff., with its clear denial of the Davidic descent of the Messiah, embarrass the creators of the Davidic genealogies of Matthew and Luke? Yes, but it is most likely the creation of earlier Christians who knew Jesus wasn't Davidic and decided to challenge this troublesome premise of Jewish critics. It appears in the Epistle of Barnabas with no attribution to Jesus.

Even the "I will destroy this temple made with hands and in three days raise up another not made with hands" (Mark 14:58) saying began as a theological *vaticinium ex eventu* (prediction after the fact) coined by Christians, meaning that the temple was destroyed because Jews rejected Jesus, and that Christianity erected a spiritual temple on its ruins. It only became too hot to handle once it occasioned persecution by Romans later.

The criterion of multiple attestation means to vindicate sayings of Jesus found in more than one independent gospel source. Such multiple occurrence makes it less likely that a particular saying is the coinage of some lone wolf prophet or of the evangelist himself. (The criterion is exactly analogous to that of "catholicity" in the case of the New Testament canon: only widely attested writings were eligible.) If a saying went back to Jesus, it should have had more time to circulate and would have found purchase in more than one place. But rumors and inauthentic, misattributed sayings can make the rounds, too. Can we discern the life settings of various elaborations and embellishments of this or that pericope, and thus tell when and where in the history of the community they were added? Yes: Bultmann and Jeremias do this quite effectively in many cases. But as Jan Vansina points out, one can only show in this way that a saying is *in*authentic. One may not be able to show the saying or story is spurious from its beginning, but this may be because we can't trace it all the way back. The burden of proof is on the defender of authenticity, and it seems a burden that no scholarly Atlas can bear. Thus, though there may once have been a historical Jesus, a Jesus who lived, there is no historical Jesus any more. None is available to us with any real degree of probability. Guesses may be made—and guesses have continued to be made—but guesses are all they are; and too often they are the reflections, as Modernist George Tyrrell observed long ago, of the face of each "quester." We may survey some of the guesses of recent experts in the field.

Geza Vermes (*Jesus the Jew*, 1973; *The Religion of Jesus the Jew*, 1993) notices the similarity between many aspects of the Jesus story in the gospels and tales told of Galilean Hasidim like Honi (Onias) the Circle-Maker and Hanina ben-Dosa. Heavenly voices claimed all these men as "my son." All were in trouble with more orthodox scribes for lax observance of Halakah (Rabbinic rules of conduct and ritual) at certain points. All were effective exorcists of demons, their name alone sufficing to put them on the run. All worked miracles. All addressed God as *Abba* ("Father"). Vermes's essential case is that Jesus was a Galilean Hasid (charismatic holy man). But Vermes is too trusting both of Hasidic and Christian legends. He might effectively argue that Galilean Christians employed such legends to interpret Jesus, but that's all. Surely no one actually heard a heavenly voice claiming any of these men as sons of the Almighty. It is a legend in all cases. And did Jesus call God *Abba* at all? We find this only in the Gethsemane story (Mark 14:36) where all possible witnesses are asnooze. Mark has simply attributed Christian prayer language (Gal. 4:6), inherited from the Aramaic church, to Jesus.

Ben P. Meyer (*The Aims of Jesus*, 1979) just dishes up warmed-over Jeremias. He has Jesus as a Messiah and would-be spearhead of a movement of national repentance. He is recognizably the orthodox Protestant Christ, going to the cross with eyes open. This book is a throwback to the lives of Jesus written around World War II by Jeremias, Vincent Taylor, T. W. Manson, William Manson, A. M. Hunter, and Oscar Cullmann. Like them, Meyer accepts altogether too much as authentic which is demonstrably redactional—for example, the Matthean antitheses (Matt. 5:21–48), on the basis of which Meyer makes Jesus challenge scripture itself with Christological authority. Like his predecessors, Meyer pretends to be a critic, agreeing to place some gospel items on the shelf but retaining those bits which contain only a residual wash of Christian dogma. Meyer then claims that since what he has left is more modest Christologically, then it is early and authentic, and since it contains implicitly or by hint what the bracketed materials say explicitly, then we can go on and accept as authentic the explicit features of the rest, too. Pure sleight of hand! Meyer also makes use of the argument from silence when it suits him (Jesus must have aimed at collective national repentance because it is a common Jewish notion, even though Jesus never explicitly mentions it), but he rejects it when it does not. He even makes Jesus satirize the idea of Gentile destruction in the eschaton—by ignoring it!

Juan Luis Segundo (*The Historical Jesus of the Synoptics*, 1982) makes Jesus an agitator of class conflict. His argument, however, is a chain of weak links. The Lukan beatitude on the poor (Luke 6:20) is taken in a classist sense, though a Cynic frame of reference makes at least as much sense (see below). He assumes a climate of unrest in Galilee that Sean Freyne, Richard A. Horsley, and others have shown is anachronistic. He makes much of Jesus offering the kingdom to the poor en masse, by doing miracles for individuals when he could not have known whether they were pious Jews or not. But this assumes that Jesus regarded his healings (if he did any) as signs of the in-breaking kingdom, as in the saying, "But if I cast out demons by the finger of God, then the kingdom of God has come upon you" (Luke 11:20). Alas, this is probably a subsequent cloaking of the original magical character of the Beelzebul story, in which Jesus defended the practice of binding the Strong Man Beelzebul so as to use his demonic power to divide his kingdom, conquer him, and free his hostages.

Segundo makes the entry into Jerusalem a messianic provocation, though the earliest gospel, Mark, carefully refrains from having the crowd acclaim Jesus as the Davidic King. The later gospels rewrite it adding "Hosanna to the King (or the Son of David)." Segundo accepts Jeremias's fraudulent equation of the *haberim* (pious dining clubs), the Pharisees, and the Javneh rabbis on the one hand, and the equation of the "sinners" with the common people on the other, which he needs to do if he is to cast Jesus as a champion of the downtrodden poor against their legalistic Pharisee oppressors. He takes even Acts 1:6 seriously as history, so he can say the disciples must have had a political understanding of the kingdom, and that they must have derived it from the pre-Easter Jesus. Unconvincing.

E. P. Sanders (*Jesus and Judaism*, 1985) does a wonderful job in dismantling the anti-Semitic confusions and deceptions of Jeremias and others who made a caricature of Judaism. He shows how, in view of the work of Jacob Neusner and others, we cannot attribute to the Pharisees all the niceties of the Mishnah. We cannot attribute to them the purity vows of the *haberim*, nor can we ascribe to the *haberim* a contempt for outsiders who did not choose their supererogatory discipline. We must not attribute to the Pharisees either the excommunicatory power of the Javneh rabbis, nor any perverse opposition to Jesus's preaching of grace and mercy to repentant sinners. No such Pharisees existed until Christian polemic created them, and certainly Jesus was not condemned for preaching grace and repentance. To explain why Jesus died, Sanders falls back on the model of Jesus as a proclaimer of the end and a predictor of the destruction and replacement of the temple. This plus the cleansing of the temple sealed his doom. But Burton L. Mack has shown anew that we cannot take for granted the historicity of the temple act, and certainly not that of the temple saying (see above).

Sanders also builds a case for an eschatological Jesus on dubious sayings such as "But whoever is least in the Kingdom is greater than [John]" (Matt. 11:11/Luke 7:28) and the promise that his followers will sit on thrones to judge Israel (Matt. 19:28/Luke 22:29–30). The former is obviously a polemical corrective to what was later seen as overpraise of a competitor, while the latter was a

saying of a Christian prophet (cf. Rev. 2:26–27).

James Breech (*The Silence of Jesus*, 1983) completely dehistoricizes Jesus, making him mouth Nietzscheanisms (see Friedrich NIETZSCHE), codependency jargon, and late-twentieth-century academic sophisms. Can Jesus really have defined the Kingdom of God as that power that generates the being of individuals as free individuals? Here all distinction between exegesis (what the text meant to its first readers) and hermeneutics (what it might imply for modern readers) has been left far behind. Breech is quite helpful, though, in his indications of the inauthenticity of the seed/growth parables (Mark 4:26–32; Matt. 13:33) insofar as they seem to be fictive "predictions" of the later spread of the Christian Church. Also, his case that the interpretive frame for the parables, "The Kingdom of God is like . . . ," is in every case secondary is quite worth considering.

Marcus Borg (*Conflict, Holiness and Politics in the Teaching of Jesus*, 1984; and *Jesus: A New Vision*, 1987) is another "perilous modernizer" of Jesus. His Jesus is Vermes's Galilean charismatic made into the leader of John G. Gager's (*Kingdom and Community*, 1975) revitalization movement, preaching in contrast to traditional Jewish nationalism a "grounding in Spirit rather than in culture," teaching this phantom sophistry by means of parables interpreted along the perversely modern lines of Breech and Crossan.

Morton Smith's *Jesus the Magician* (1978) shows that not only is Jesus reputed to have been a sorcerer by his opponents both within and without the gospels (including the Talmud and Celsus), but he is shown in the gospels using magical techniques, such as spittle (contagious magic), finger manipulation (imitative magic), groaning to muster psychic power, and silencing the demons. Granted, John M. Hull had shown most of this in his *Hellenistic Magic and the Synoptic Tradition* (1974), but Smith shows how even the descent of the Spirit story reflects the coming of the magician's familiar spirit in the form of a bird. The wilderness testing with spirits approaching under the guise of animals is a typical shamanic initiation. When the Centurion recognizes that Jesus's word of command will be effective (Matthew 8:8–9), he must know that Jesus commands spirits. Thus Jesus had a reputation as a magician.

John Dominic Crossan (*The Historical Jesus*, 1991) seems to accept most of Smith's case. He combines it with material drawn from Richard A. Horsley (*Jesus and the Spiral of Violence*, 1987) and Gerald Downing (*Christ and the Cynics*, 1988; *Cynics and Christian Origins*, 1992) to arrive at a Jesus who was part Cynic philosopher, part sorcerer, and whose only real revolutionary activity was to have potluck suppers with the socially outcast. This vast book should have been much thinner. Its picture of Jesus seems to be mostly a function of the scholarly categories used to analyze him, an unwieldy composite. It has much in common with certain portions of Burton Mack's *A Myth of Innocence*. Mack, too, sees a good deal of similarity between Jesus as portrayed in certain gospel materials (especially the Mission Charge, Mark 6:12–11, and the early portions of the Q source) and the Cynics. Indeed the similarities are striking. The Cynics preached ideal kingship, the "government of Zeus," and the regulation of life by nature. They preached that one should love one's persecutors. They upbraided the crowd. They begged. They wandered as sons of men for whom nature provided, unlike foxes and birds, no natural habitats.

Mack's great insight is that the various Jesus and Christ images presupposed in various gospel materials do not readily fit together. A parable-spinning exorcist? A halakah-spouting redeemer? And where in all his Galilean wanderings does he ever utter a word relevant to what finally happened at the temple? Jesus's life as well as his death must remain unknown to us, Mack says. The variegated traditions, combined against their original intents by Mark and variously reshaped by others, stem from incompatible religious movements that used their diverse traditions as legitimation charters. In this way, Jesus turns out to be a cameo or a microcosm of the Bible as a whole.

ROBERT M. PRICE

BIBLICAL ERRANCY. The Theory of Infallibility. In the first decade of the twentieth century, various Protestant scholars began contributing articles to *The Fundamentals*, an influential conservative Christian anthology, to counter what they regarded as the dangers of modern BIBLICAL CRITICISM. Professor James Orr expressed their sentiments when he wrote that the Bible was the repository of a true revelation of God and an infallible guide. By following scripture, one could, he insisted, find salvation, the purpose of living, and the scheme of divine grace. In the second half of the twentieth century, the phrase *biblical inerrancy* expressed the belief that the Bible in its original autographs stood free of error. Whereas the third-century church father Tertullian contended that only the church had the right to interpret scripture, Protestants later rejected the doctrine of papal infallibility to affirm the thesis that believers in fellowship with other believers were free to interpret scripture provided the Holy Spirit guided them.

Relentless Biblical Scholarship. For the past century and a half, the conjecture of biblical inerrancy has steadily yielded ground to biblical scholarship's relentless inquiries into the historical sources, diverse literary genres, rhetorical strategies, and redaction processes. Arranged by topic with cross-references, C. Dennis McKinsey's *Biblical Errancy: A Reference Guide* focuses on biblical contradictions, errors, fallacies, and significant dilemmas. McKinsey is also editor and publisher of *Biblical Errancy Newsletter* and author of *The Encyclopedia of Biblical Errancy*.

Bart D. Ehrman's *The Orthodox Corruption of Scripture* argues that certain orthodox Christians altered various texts of the Bible to suit their theological doctrines. Gerald A. Larue's *Ancient Myth and Modern Life* casts important light on the emergence of religious traditions. In *Can We Trust the New Testament?* G. A. Wells spells out in readable, scholarly detail reason for concluding that the New Testament as a historical document is largely unreliable. Like Wells in his several books on the historical Jesus question, Robert M. Price argues in his *The Incredible Shrinking Son of Man* that the New Testament provides meager information for reconstructing a trustworthy representation of a historical Jesus. *The Empty Tomb: Jesus beyond the Grave* (edited by Price and Jeffery Jay Lowder) deals with severe problems in the various stories of Jesus's resurrection among first-century Christians.

JOE EDWARD BARNHART

BIBLE, THE, AND VIOLENCE. The Bible is not so much one book as a confluence of genres and redactions giving voice to a family of themes, guided roughly by a highly anthropomorphic model of the universe. Violence in the text, which is ample, tends to appear under several broad headings.

Extermination. Since the Hebrew version of the book of Esther does not mention a deity, some rabbis opposed its reception into scripture. To counter its secular tone, the Greek version reconstructed the story with additions providing explicit religious, apocalyptic, and cosmic elements. In both the Hebrew and Greek versions, the story tells of King Ahasuerus's edict to exterminate all the Jews throughout the provinces. Because of the political maneuvers of Esther and her Uncle Mordecai, the king reversed his edict by issuing a decree permitting the Jews to exterminate all who might attack them. This included the liquidation of enemy women and children. Their goods were confiscated on this "day of vengeance," and Uncle Mordecai acquired the king's blessing and an imposing golden crown. Thereafter, many of the people of Susa professed Judaism "because fear of the Jews had fallen on them" (8:17).

In *War in the Hebrew Bible: A Study in the Ethics of Violence*, Old Testament scholar Susan Niditch notes that the Boston Puritan preacher Cotton Mather partially

justified killing the natives by using examples of Israel's alleged extermination of Amalekites, Canaanites, Midianites, and other enemies. "The particular violence of the Hebrew Scriptures has . . . served as a model . . . for persecution, subjugation, and extermination for millennia."

The Amity-Enmity Complex. Various theories have been advanced to help to explain the prevalence of approved violence in the Old Testament. Philosopher Herbert SPENCER, drawing partly from Charles DARWIN's study of animal behavior, noted that numerous species appear to live by a dual code. According to the first code, members of the social unit bond for support, defense, and affection. According to the second code, the group expresses hostility and aggression toward outsiders of the same species. The insiders-versus-outsiders syndrome runs throughout both testaments of the Bible. The New Testament apocalypse, for example, features intense and undying aggression toward the enemy. The book of Revelation portrays the enemy, including the Roman government, as the emanation of Satan, who will not be exterminated but given a worse sentence, namely, everlasting torture. Borrowing from such passages as Enoch 10:4 and Jubilees 48:15, the author of the New Testament apocalypse yearns for the day of fierce revenge. Unlike the Christ who cries out from the cross, "Father forgive them; for they do not know what they are doing," the martyrs in the book of Revelation cry out for vengeance.

Apocalyptic thinking in the New Testament projects both stark dualism and the amity-enmity complex onto its version of the deity. Its deterministic outlook in some cases presents a deity who predestines some human instruments to receive his love and others to become the objects of his hatred. Before the twin boys in Rebecca's womb were born, God loved one and hated the other. Jacob became the recipient of amity, whereas Esau was created to serve as the object of divine enmity (Rom. 9:11–24).

Pathological Wrath. A surprisingly large portion of the Old Testament purports to be accounts of violence and mayhem that the god Yahweh commanded, supported, or carried out directly. In 1 and 2 Samuel, he appears as Israel's king and chief warrior. Yahweh exemplifies pathological violence in various sections of biblical literature. The most bizarre is his disgust with the human race to the point of drowning every man, woman, and child except for eight individuals. His rage becomes so out of control that he destroys most of the animal kingdom, which presumably was guilty of no sin. Whereas Yahweh in Genesis promises never again to destroy the earth with floods, the god of the New Testament apocalypse resorts to fire, hail, earthquake, and pestilence to bring about mayhem and agony. The promise of Genesis 9 turns out merely to restrict the means of mass destruction.

Cosmic Dualism. Various attempts have been made to reframe the apocalyptic cruelty in the New Testament. According to the apocalyptic writers, the targets of violence bring it upon themselves. By offering a cosmic version of the insiders-versus-outsiders motif, the author of the book of Revelation views all human beings outside his religion as mystically connected to evil personified, to a cosmic Satan. The same dualism appears in the Gospel of John, where Jesus stands in deep conflict with "the Jews," who do not believe in him. He says to them, "Your father is the devil and you choose to carry out your father's desires. He was a murderer from the beginning" (John 8:44–46).

Earlier, this gospel advanced the thesis that everyone is condemned already. Only those who come to believe that Jesus is God's only begotten son can escape everlasting wrath. Unbelievers are thus regarded not as individuals harboring honest disagreement, but as agents of evil who prefer darkness to light (3:18–19). The writer of this gospel appears to have incorporated the amity-enmity model, extolling love for believers and exuding malice toward unbelieving outsiders.

The First Epistle of John also extols love, most of it reserved for fellow believers. "God is love," and whoever loves God must love fellow believers. If a believer "does not love a fellow-Christian whom he has seen, he is incapable of loving God whom he has not seen" (1 John 4:20). This writer seems unable to acknowledge, however, that love exists outside the Christian circle. Like the book of Revelation, 1 John is thoroughly dualistic, insisting that except for believing Christians "the whole world lies in the power of the evil one" (5:19). Non-Christians are "the spirit of antichrist" (4:3). The dualism that pervades this epistle becomes vitriolic. Anyone who does not think Jesus is the heaven-sent Messiah is called a liar: "He is the antichrist" (2:2).

Violence Turned upon the Chosen. One of the most perplexing aspects of the Old Testament is the violence Yahweh is said to have frequently inflicted on Israel. The prophets and the Deuteronomic tradition had advanced the theory that Yahweh controlled all human events. The conspicuous defeats and suffering that came to the people of Israel—often at the hands of foreign armies—created serious challenges to this theological theory. What advantage did people enjoy in being the chosen of Yahweh if he could not protect them? It seemed that either there was no advantage or the idea of a chosen people was a delusion.

According to some interpreter of 2 Samuel 24, after becoming angry with Israel for no apparent reason, Yahweh incited David to commit the sin of taking a census of the people so that he (Yahweh) could have a reason to inflict a punishment on either David or his subjects. The punishment came in the form of a plague that liquidated seventy thousand citizens. The destruction would have continued, according to the story, had David not offered appropriate burnt animals to appease Yahweh (2 Sam. 24:18–25). Earlier in the story, a three-year famine in the land ended as soon as David turned Saul's male descendants over to the Gibeonites to be crucified or dismembered as a sacrifice to Yahweh on the moun-

tain of Yahweh (2 Sam. 21:1–14). This human sacrifice satisfied the Gibeonites, who wanted revenge for what Saul had done to them generations earlier. The redactor of this grim story says the famine did not end until Dạvid retrieved and buried the bones of the men he had earlier delivered to be executed. This redaction does not state explicitly that in handing over the male descendants of his predecessor on the throne, David conveniently liquidated most of his rivals to the throne.

Other Interpretations. Entirely different accounts of the prophetic and Deuteronomic theological interpretation of those macabre events are possible. According to a more secular version, the death of thousands of Israelites came about by natural causes and conditions. The epidemic eventually subsided, but not by David's deeds or the execution of Saul's descendants. According to the monotheistic redactor of 1 and 2 Samuel, several popular stories can be reshaped and woven in with other materials, provided the chief concerns guide the overall narrative. First, Yahweh must always be portrayed as in control of all lives and events. Second, David must appear as Yahweh's chosen king-Messiah of all Israel and Judah. The following is the extension of this rewrite. (1) Yahweh rejected not only King Saul (giving him an evil spirit), but also all the claims of Saul's heirs to the throne. (2) Contrary to what many have said, David did not murder his rivals to the throne but handed them over to the Gibeonites to satisfy their just claim for justice and blood revenge. (3) Although David did have Uriah murdered so that he could have intercourse with Bathsheba (who eventually became the mother of King Solomon), he did not murder Abigail's husband, but rather married Abigail only after Yahweh killed the husband. (4) David in his magnanimity honored Saul by reclaiming his bones and those of his butchered descendants and burying them in a friendly land. (5) David's righteous deed and his offering of a blood sacrifice induced Yahweh to restrain his wrath sufficiently to end the plague and the draught.

Without the redactor's theological reconstruction, the epidemic does not appear as a purposive act of violence by a wrathful god. Much of the violence that needs to be explained turns out to have been carried out by David and his band of outlaws and malcontents who resorted to extortion, spying, treachery, terror, murder, and large-scale thievery to gain power, territory, and eventually David's replacement of Saul and his heirs to the throne.

Many Old Testament scholars view Saul and David as something like Mafia chieftains who operate through coercion, presenting citizens with offers they cannot refuse. The world of the Deuteronomic tradition was fraught with danger, strewn with chaotic forces, including enemies, traitors (like David), criminals, sociopaths, opportunists, and dysfunctional families. In short, much of early Hebrew life approximated a Hobbesian "state of nature" in which life was nasty, brutish, and short. In *Leviathan*, Thomas Hobbes contends that the turbulent, violent condition in which Hebrews had to live at the time of Saul and David required a king with absolute authority to secure the Hebrews' safety. Royal violence thus became a necessary evil to restrain the mayhem that prevailed at the time.

The Ban (*Hērem*). The grimmest of the rules of Israelite holy war was the *hērem*, or ban, which is nothing less than genocide. According to 1 Samuel 15, Yahweh ordered King Saul to liquidate the entire Amalekite population: "Spare no one. Put them all to death, men and women, the children and babes in arms, herds and flocks, camels and asses" (1 Sam. 15:2). When Saul spared the life of the Amalekite king, Samuel the seer became enraged and personally executed the king by hewing him into pieces "before Yahweh at Gilgal." In doing this before Yahweh, Samuel apparently believed he was completing a human sacrifice. The entire ban or extermination of the Amalekites was considered a sacrifice to Yahweh. The concept of *hērem* as Yahweh's portion of the kill was deeply rooted in ancient Israel. The apparently wanton, meaningless destruction of human and animal life took on theological meaning when viewed as a sacrifice. While one part of the Hebrew tradition condemned the sacrifice of human children to Yahweh, another part held that it was accepted.

Sacrificing Children to God. Whatever the historical facts of the Hebrews in Egypt and their departure were, the writer of Exodus claimed that the god Yahweh, after presumably hardening Pharaoh's heart or mind, slaughtered the firstborn of all Egyptian families, including the cattle. This was presumably a way to pass judgment on the Egyptian gods (Exod. 11–12). Some Old Testament passages indicate the belief that Yahweh owned the firstborn of everything, as well as the first fruit. Yahweh referred to Israel as his firstborn son (Exod. 4:22).

Two inscriptions from Upper Mesopotamia dating to the tenth century BCE allude to the burning of seven of the blasphemer's sons as punishment for having defaced the name of the royal family. Seventh-century BCE contracts include burning the eldest son in the sacred precinct of Adad as punishment for violating the contract. According to Genesis 22, Abraham believed he heard Yahweh tell him to sacrifice his firstborn son (at least the firstborn to his wife) on the altar. Later in the story, Yahweh revealed he had not really meant it. Later, some rabbis as well as Christian and Muslim theologians praised Abraham for his *willingness* to offer Isaac as a burnt offering.

Conflicting Views regarding Blood Sacrifice. The eighth-century prophet Micah appeared to believe that Yahweh required not calves, rams, oil, or "my eldest son for wrongdoing," but justice, humility, and loyalty (6:8). The Hebrew tradition struggled with the moral problem implicit in human sacrifice. In *Abraham on Trial*, Carol Delaney deals with Jewish, Christian, and Muslim attempts to transform human sacrifice into something well pleasing to a deity. As if to shift the focus from the

moral contradiction (euphemistically labeled a paradox by some Kierkegaardians), various interpreters have written about Isaac as the archetypal martyr, the beloved son who freely submits to his father's and Yahweh's murderous intent. The apostle Paul and the author of the Epistle to the Hebrews viewed the crucifixion of the beloved Son of God as a willing sacrifice essential to bringing about forgiveness. When the doctrine of vicarious atonement portrayed god as persecuting his only begotten son because of humanity's sin, it raised questions about the character of the god demanding the violence. The doctrine portrays him as taking part with the group in killing the victim. René Girard and others advance the thesis that the whole process of creating moral approval for cruelty and liquidation gave birth to a conviction that the victims, far from being genuine human beings, were the poisonous agents of contagion and pollution. Much of the Bible appears deeply involved in notions of ritual impurity.

Unending Violence. By the first century CE, the idea of everlasting torment had become a part of some branches of Judaism and emerging Christianity. The Greek word *Gehenna* referred to the garbage area outside Jerusalem and became a symbol of the place where the unclean or the unbelievers would be cast. Since unbelievers were seen as unholy and impure, many believers felt that holiness required unbelievers to suffer perpetual torment in the eternal garbage pit where the worm would not die and the fire would never be extinguished. Various attempts to spiritualize the fire have been motivated by the desire not to reduce the amount of human torment, but to escape the conclusion that the torment springs from God's perpetual acts of unprecedented, relentless violence against his creatures.

Historically, the word *Gehenna* derived from the Hebrew *ge-hinnom*, the valley of Hinnom, where various kings of Judah engaged in human sacrifice by fire (2 Chron. 28:3, 33:6; Jer. 7:31). The prophet Jeremiah denounced it as foreign to the mind of Yahweh. King Josiah regarded the practice as wicked and ended it. Ironically, many Jewish and Christian believers of the first century embraced the idea of human sacrifice by fire. According to various Old Testament passages (Gen. 8:21; Exod. 29:19–25; Lev. 8:21, 23:13; Num. 15:10, 28, 22–24), the god Yahweh apparently required certain select animals to be cooked over open flame. The pleasing aroma ascending to heaven would bring him great satisfaction. Some portions of the New Testament portray the crucifixion of Jesus as a satisfying sacrifice to god: "Christ gave himself up for us, a fragrant offering and sacrifice to God" (Eph. 5:2).

The idea of human sacrifice by fire persists in some branches of Christianity. *Gehenna*'s inmates become a perpetual sacrifice to the god's presumed holiness. By never allowing the inmates to lose consciousness, this god established human sacrifice in perpetuity. Ironically, if taken to its logical conclusion, the doctrine of everlasting *Gehenna* would render the sacrifice of Jesus to have been slight when compared with the sacrifice made endlessly by any one of the unbelievers. Some Christians who reject the doctrine of everlasting torment interpret the flames of *Gehenna* to be the burning enmity and hostility within the hearts of some of their fellow believers.

BIOETHICS AND UNBELIEF. On the face of it, bioethics without belief is mostly bioethics, for much of contemporary thinking about bioethics has been developed without the explicit and obvious derivations of principles from religious assumptions. The leading bioethics text of the twentieth century, Tom Beauchamp and James Childress's *Principles of Biomedical Ethics*, was written with the idea that whatever religiously derived principles the one (Childress) might offer, the other (Beauchamp) could demonstrate from nonreligious beginnings.

That work, now part of the core of bioethics literature, follows various professional organizations and federal commissions in endorsing a set of four principles from

which various rules and guidelines are derived for more specific situations. They are the principle of nonmaleficence, the principle of beneficence, the principle of autonomy, and the principle of justice.

The principle of nonmaleficence enjoins healthcare practitioners to avoid being the causes of harm to patients and others. It is the oldest and primary principle of the medical ethics found in the writings of Hippocrates, a Greek physician born in 460 BCE, which dominated the practice of medicine in subsequent centuries. Though contemporary bioethics has preserved this ancient principle, because of the growing power of medical intervention and the cultural drift away from unitary conceptions of human good and harm, nonmaleficence as a principle has been placed on equal footing with the principle of autonomy.

The principle of autonomy recognizes the importance of the values and wishes of patients in determining the direction and extent of medical interventions. The principle is clear enough for the competent patient with full capacity to understand the consequences of a choice among the alternatives offered by medicine (including the possibility of no action). This principle is the basis for the requirement, in both medicine and research, of *informed consent*, generally interpreted as a requirement to present to the patient or subject the proposed treatment or research protocol, the alternatives that fall under standard practices of the profession for the malady or injury in question, and the potential consequences of each alternative and their likelihood of occurring. Patients may then, with assistance, compute the expected value of each alternative and its probable consequences weighted by their own personal values. Healthcare professionals, given the patients' choices, may then elect to comply or to leave the therapeutic relationship (under certain conditions), thereby preserving their own autonomy. In the research context, potential subjects must be provided with explanations of the research protocol and its attendant risks given in language appropriate for the individual's level of education and must be provided with the opportunity to exit the protocol at his or her choosing.

But the capacities of many patients are severely diminished—by dementia; by psychoses and neuroses; by infancy or youthfulness; or by coma, persistent vegetative states, and other neurological disorders. For such patients, concurrent informing and consultation is usually not possible; various alternative strategies have been devised that seek to make an approximation of the patient-centered decision process. Advance directives given formally to caregivers or through written documents, or informally to friends and relatives, are typically sought. Where they cannot be found, substituted judgments based on what is known of the patient's values and beliefs are often sought. Where those are unknown or insufficient, various rational-person standards, either culturally explicit or culturally neutral, are employed. The ethics committees of hospitals and other institutions devote much time to grappling with these difficult decisions, which are often complicated by the emotions, interests, and values of family members, friends, and healthcare providers. Sometimes this spills over into the public arena accompanied by the posturings of politicians and special interest groups. The now-infamous Terri Schiavo case illustrates how explosive these decisions can become.

The principle of beneficence provides both the general motivation to provide medical services to patients, and for seeking to advance medical practice through basic and applied research. Beneficence is understood as implying both a duty to remove and to prevent natural harms, and—more controversially—a duty to provide positive enhancements to ordinary lives. Beneficence as harm prevention prompts widespread vaccination and inoculation programs; beneficence as harm removal prompts research into development of new surgical techniques, artificial organs, prosthetic devices, and even of fields such as genomics and proteonomics in order better to understand and adjust treatment to the individual's responses to potential therapies. Beneficence as enhancement prompts research that aims to improve the individual's naturally occurring qualities, including selection of characteristics in potential offspring, the use of surgery and other treatments to augment appearance through implants and various injections, and even off-label uses of steroids and other drugs and techniques to enhance performance of athletes. This third, most controversial type of application of the principle of beneficence arises out of what has been called the technological imperative, the position that what is technologically possible ought to be tried. It further reflects the pressure of a society that funds medical research and education in order to serve more than just its health needs as traditionally conceived.

Finally, the principle of justice seeks to remind practitioners—as well as the social and economic constructs that cover the costs of their services—that fundamental respect for human dignity requires that at least basic medical services be available to all, regardless of any patient's ability to pay for them. Further, the principle of justice requires that the burdens of research be borne by the full range of individuals who have the potential to benefit from its results, and not by elements of a society that, because of particular vulnerabilities, present tempting populations for exploitation. This principle is thought by some to imply a moral requirement for universal health insurance; minimally, it implies an obligation on the part of hospitals and providers to provide treatment in emergency situations without regard to the patient's ability to pay.

Bioethicists generally agree on these principles, although some caution against applying them too rigidly. They may cite the enormous variability in human circumstances, social structures, and belief systems as rea-

sons why reasoning based on principle is often inadequate to the problems of bioethics. Others insist that the goal of bioethics ought not to be to articulate principles and rules underlying bioethics, but rather to articulate the qualities of character, or virtues, required of good physicians and other healthcare professionals. But the greatest disagreements within bioethics are rooted in the background metaphysical presuppositions and beliefs held by the practitioners of bioethics.

Religious Approaches. Religious traditions locate the warrant for the principles of justice, beneficence, nonmaleficence, and autonomy in natural rights: that is, rights of humans arising from their natures as creatures of a supreme being who is often characterized in terms of analogies with human roles. Thus, the supreme being is characterized as a lawgiver, a father to human children, and an all-knowing, omnipotent, perfectly good being. Many traditions teach that this being is engaged in a struggle with a powerful but malevolent lesser being; human disease and suffering are often laid at the door of this diabolical one. So on the religious view, the warrant for bioethical principles lies in the nature of humans as creatures of a supreme being, beings who possess free will and who reside in a world characterized by the evil machinations of a would-be tyrant; in such a world, the mandates of medicine lie in that profession's efforts to ameliorate suffering and restore health as the natural and optimal state of a creature in a theocratic struggle between good and evil. Even without the postulation of satanic forces, traditional religious bioethics recognizes the tension between what humans may will or wish and what is acceptable to their creator. The *rapprochement* between religious and secular ethics has often turned on the question of what it is that makes the supreme being's wishes good (see ETHICS AND UNBELIEF). If that being wills something *because* it is good, then there must exist a standard for good that preexists and is independent of the divine will, some standard which is potentially as discoverable by reason as it is through revelation.

Nonreligious Approaches. Various nonreligious traditions provide a range of options for grounding bioethics. Utilitarians generally accept the primacy of pleasure or happiness for humans as a universally shared, primary motive, and see the pursuit of scientific knowledge and technology as serving the maximization of happiness and the minimization of suffering through a common duty of all humans. That common duty to produce the greatest balance of benefit over disbenefit for all those affected by your actions is itself explained in various ways: through a theory of natural moral sentiments; through an analysis of the logic of the nature of each human as a rational, purposive agent; or through a sober agreement to constrain self-promotion in recognition of the dangers of such a policy gone rampant.

Hence, there is no general ethical theory of unbelief, unitary in its core assumptions, that can provide a single positive account of the principles of bioethics. Part of the genius of Beauchamp and Childress's work lies in the effort to settle on a common ethics of healthcare *despite* the diverse origins of its principles in various religious and nonreligious traditions. In a pluralistic society, such an achievement is an admirable lesson in mutual respect and cooperative accommodation.

When Religion Matters. Nonetheless, there are two major arenas of bioethics in which the presence or absence of religious presuppositions seems to make a major difference in conclusions regarding how medicine ought to comport itself, and regarding what is to be regarded as morally permissible in options offered to patients. One is the arena of conception, with its attendant issues of abortion and fetal stem cells. The other is the arena of death and dying. That is, at beginning and ending points of human life, we find that prior religious metaphysical assumptions typically result in the advocacy of markedly different outcomes from those advocated by persons whose values are not grounded in religiously dictated beliefs.

The metaphysical presuppositions of religiously guided bioethics are typically associated with the concept of the presence of a *soul*, a hypothesized entity held both to explain the orderly development of the unique qualities of the human being through gestation and maturation and to tie the mandates of religious commands to eventual consequences of reward or punishment. A common position is that the individual's immortal soul is present within the body from the "point" or "moment" of fertilization until the "moment" of death. From this premise, together with the assumption that fundamental human rights are bestowed on every being with a soul, it follows that the right to life is present from the very earliest point of human development. Hence, any action that destroys the resultant embryo, whether in an act of abortion or in pursuit of stem cells for research or medical treatment, is a violation of the individual human being's right to life.

Associated rights to being conceived in a natural way—that is, between married parents who experience the unitive and procreative aspects of sexual intercourse—are found in the religious and metaphysical presuppositions underlying much of religious bioethics, a view conspicuously espoused by the then-cardinal Josef Ratzinger, now Pope Benedict XVI. From these doctrines arise the standard prohibitions against conceptive-preventive measures insofar as these are conceived as thwartings of divine purposes.

Dilemmas of Twinning and Cloning. Those holding such a religious view must make various ad hoc arrangements to handle such issues as twinning and cloning. If future persons are endowed with souls at the earliest moment of conception, how are cases in which later bifurcation will occur held to be accommodated? On the most "conservative" view, a fertilized ovum that is destined later to become twins has two souls infused into it at fertilization, as recently argued by Rose Koch. A fer-

tilized human ovum not so destined cannot be made into twins; the fact that fertilized ova of other species are capable of such artificial cleavage into twins is not evidence of such possibilities for humans, as it is the infusion of the soul (presumably, solely an endowment of humans) that completes the individuation of the human embryo into a given person.

Somewhat surprisingly, this view implies predictions that make it, at least in the version as described, capable of being tested—although the ethics of attempting any such test poses deep difficulties for the religious viewpoint. First, given that a particular embryo not destined for twinning has already been endowed with but a single soul, it should not be possible to subject that embryo to an artificial process of twinning—that is, to render it mechanically into two or more undifferentiated bundles of totipotent cells each of which can then proceed through normal gestation and development. For the role of the unique soul is to produce a unique individual; even in the case of natural identical twins, the view is that they are preordained to emerge by some supernatural power that foresees, if not determines, the twinning; in such cases two souls are associated from the start. Given other assumptions about the independence of human action, a deliberate, artificial twinning should be physically unable to produce two viable offspring. Conversely, if such an artificial twinning were successfully to occur, that would constitute evidence that a single, indivisible soul had not been associated with the embryo from its earliest stages.

Second, given that two embryos each have an individual soul implanted within from the earliest stages of development, it should not be possible for those embryos to fuse and produce a single individual. Ad hoc adjustments are, of course, possible even here; one might hold that in the case of natural fusion, the fused individual was preordained and one of the embryos lacked the requisite soul, or perhaps lost it in the process of fusion. But the possibility of artificial fusion, given the standard assumptions about human authority for human actions, would imply that this ad hoc adjustment could not be extended to artificial fusion. That is, given two embryos each with a soul, it ought not to be possible for them to be deliberately fused into a single ball of totipotent cells that can then become implanted and develop into a single human being, albeit with some untypical characteristics: perhaps both male and female external sex organs, perhaps two distinct blood types, and perhaps with different cells in the same organ or tissues showing XX and XY chromosomes. That such chimeric humans occur naturally is beyond dispute.

Finally, the possibility of cloning an individual human from the somatic cells of another human, thereby bypassing the process of fertilization altogether, places yet another burden on the proponent of traditional religious ontology. Should the cloning of human cells eventuate in an embryo, the question of when a soul is infused becomes even more tenuous. The soul associated with the individual from whom the skin cell was taken presumably remains with that individual; also, nothing occurs that is like the union of previously disparate genetic material which is traditionally held to constitute the creation of the receptacle for the soul. Again, an ad hoc adjustment in the account is necessary, and again human agency challenges the theocentric account of the creation of unique individuals.

The view that humans are possessed of a divinely given soul characterizes the differences between religious bioethics and the bioethics of unbelief as well. Traditionalists reject the idea that your life is your property, with the consequence that, under conditions of extreme suffering and despair, ending it actively—with or without the assistance of a physician—is morally impermissible. This prohibition stands with the notion that, as creatures of a supreme being, we live at his pleasure in accordance with his plans, and that we therefore lack the authority—outside of self-defense justifications—to end our lives. In its most extreme forms, religious bioethics even prohibits killing a fetus to save the life of the mother where the threat to the mother's life is innocent of malevolent intent. Only where normal medical treatment, such as the necessary removal of a cancerous uterus, foresees but does not intend the death of the fetus is a medical act resulting in death permissible. On the traditional view intentional suicide and active euthanasia are always impermissible; under some conditions, withholding burdensome treatment that prolongs dying but does not hold significant promise of cure or return to meaningful activity is permissible even if death is thereby hastened, as is treatment of suffering where such treatments may have, as a foreseeable but unintended consequence, the hastening of death.

Implications of Unbelief for the Value of Human Life. Divorced from the trappings of religious metaphysics, mere human biological life—where the human person has either not developed or is no longer functional—comes to have at best only utility value. Tempting though it is to attach great significance to the potential for the emergence of personhood, that significance is typically tempered by considerations of probability or likelihood of successful emergence, by costs to those charged with its development, and by the prognosis for the potential human person's burdens and capacities. The utility value of the earliest states of human existence and the final stages lies with their potential as sources of organs and tissues for transplantation and research. Absent a person in whom there is a socially principled recognition of rights, it makes no sense to speak of a right to life that overrules other interests.

Among nonbelievers, there still remain substantial divisions over what is permissible in these arenas of medical decision. Some secularists have seized upon the potential of abuse in legalized physician-assisted suicide, holding that the dangers of creeping justifications

and social pressures endanger the interests of the elderly and the handicapped. Organizations such as Not Dead Yet have opposed liberalized laws, such as that in Oregon, which permit physician-assisted suicide under defined conditions as an open door to unscrupulous nursing home operators and weary family members eager to unshoulder their burdens. Often these protests lose sight of the far wider burdens to patients of an inescapable status quo, and the medical community has been slow to respond to calls for better management of patient suffering.

Nonetheless, unbelievers generally claim a right to determine, for themselves, the time and manner of their deaths. Articulate individuals such as those depicted in the film and play *Whose Life Is It Anyway?* have advanced a powerful challenge to traditional attitudes toward unwanted life, advancing the thesis that the autonomous individual with capacity should have the choice between ending life while still with capacity, having life ended after capacity is lost but while organic life is still ongoing, and allowing the process of dying to run its natural course with or without artificial extension. Physicians such as Timothy Quill and Jack Kevorkian have responded to the requests of their patients for greater control over the end of life in a variety of ways. While, due to various complexities in the physician-patient relationship, the results have not led to federal courts recognizing a general right to assisted suicide, the effect has been to return legislation on these issues to the states, allowing for the effective emergence, state by state, of policies and practices reflecting the will of the majority of voters.

Regulation, not prohibition, has emerged as the key to avoiding a slide from the abuses of prolonged dying into abuses of hastened dying. The Oregon Death with Dignity law, now in place for nine years, has seen a gentle increase in the use of physician-prescribed lethal medication by patients with terminal diagnoses. So far in Oregon, only patients with decision-making capacity have been allowed to receive such terminating measures. In Holland and other European countries that have also permitted physician-assisted death, somewhat looser standards have seen the practices extended to formerly competent patients who have elected termination to be initiated after losing competence; in some cases euthanasia has been practiced on the assurances of family members that such is consistent with patient wishes, even if not formally recorded.

These and similar considerations have led ethicist Peter Singer recently to predict that, in the next thhirty-five years, the traditional view of the sanctity of human life from conception will collapse and be replaced by a concept of personhood that will assume the primary role in questions of ending human life. Mere membership in the species *Homo sapiens* will not be the ground of rights, but rather possession of the qualities of personhood that make in the intact person for autonomy and the possession of morally significant interests. Singer writes: "We will understand that even if the life of a human organism begins at conception, the life of a person—that is, at a minimum, a being with some level of self-awareness—does not begin so early. And we will respect the right of autonomous, competent people to choose when to live and when to die."

BIRTH CONTROL AND UNBELIEF. Though various methods of birth control have been tried throughout history, those methods were not usually mentioned in medical literature. Rather, they were more or less secret information, passed from midwives to their patients or even from woman to woman. Such knowledge was often thought to depend upon witchcraft, and some women were scapegoated for possessing alleged knowledge of ways to prevent pregnancy or induce abortion. In Western culture, this became particularly the case after Pope Innocent VIII, in a bull, or policy statement, issued December 5, 1494, stated it had been called to his attention that members of both sexes were using incantations, charms, and conjurations to "suffocate, extinguish, and cause to perish the births of women" or to "impede the conjugal actions of men and women." Such alleged practices came to be associated with witchcraft, and witches came to be viewed as the causes or sources of impotence, infertility, abortion, and preventing pregnancy. In the case of birth control, the witches were said to have secret recipes for emmenagogic medicines—recipes believed to stimulate the menstrual flow and bring about miscarriages—or, in stronger words, abortions. Some seventeenth- and eigh-

teenth-century investigators of witchcraft went so far as to claim that the better the midwife the better the witch, an unsupported exaggeration undoubtedly, but one that emphasizes the reliance of women upon other women for information. It is no accident that among the women accused of witchcraft in the Salem witch trials in seventeenth-century New England, two were midwives. Midwives in many areas of Europe were required to take an oath that they would not use any witchcraft or charms in their practices, an oath that emphasizes the association of their calling with contraception and abortion.

Since the Christian Church in much of the Western world set the moral agenda in terms of sexuality (see SEXUAL VALUES, IMPACT OF UNBELIEF ON), it was perhaps inevitable that most modern advocates of birth control were freethinkers (see FREETHOUGHT) opposed to church dominance and to the hostility the religious establishment had characteristically displayed toward birth control, let alone abortion.

One early freethinking advocate of birth control in the United States was Charles KNOWLTON. Early in his career as a physician he began giving out information about birth control, and soon wrote up his recommendations into a self-published booklet titled *Fruits of Philosophy, or the Private Companion of Young Married People, by a Physician.* His solution was for women to douche right after the emission of sperm into the vagina. The effectiveness of this depended on the douching solution, since simple douching would not eliminate the semen. He recommended two solutions. One involved alum, which is a spermicide, and could have been fairly effective if the mixture was right. He also recommended the use of sulfite of zinc, which would not have worked at all.

Finding it difficult to get his book accepted for publication, Knowlton decided to publish it on his own. He toured nearby communities in Massachusetts, giving lectures and selling his book. He was fined in 1832 in Taunton, Massachusetts, and in 1838 he was jailed at Cambridge for three months for attempting to distribute it. The net effect was to give broader publicity to his book; *Fruits of Philosophy* soon sold ten thousand copies. The book continued to be published throughout the nineteenth century by a variety of freethought presses, and was also incorporated into a variety of books on home remedies.

The attempt to distribute *Fruits of Philosophy* in England led to one of the more famous trials of the nineteenth century, the 1877 trial of the freethinkers Charles BRADLAUGH and Annie BESANT. Though Knowlton's book had gone through several previous printings in England, the authorities suddenly clamped down. Bradlaugh in fact had previously published articles on the same topic by freethinker George Drysdale in his own newspapers. Drysdale had edited an updated British version of Knowlton's book, adding discussions of contraceptive use of the sponge, the utilization of the safe period (which he said was from two to three days before menstruation to eight days after), coitus interruptus (which Drysdale felt was "physically injurious"), and the condom. Drysdale's edition was seized by authorities in Bristol in 1876 and the bookseller sentenced to two years in jail. Though the original Knowlton book had been sold in London for many years, Bradlaugh and Besant seized on the Bristol case to publish Drysdale's revision of Knowlton's book and confront the authorities. Emboldened by the Bristol case, London authorities responded by arresting the two. During the subsequent trial Bradlaugh and Besant were tried and found by the jury to have published a book calculated to deprave public morals. Yet at the same time the jury declared that the defendants should be exonerated from "any corrupt motives" in publishing the book. What this meant was unclear. Besant held that the decison amounted to saying: "Not guilty, but don't do it again."

The judge took it as a guilty verdict. The two activists were sentenced to six months' imprisonment, fined two hundred pounds, and required to each post five hundred pounds as a bond that they would not publish the book again for a period of two years. On appeal, they were acquitted on a technicality, and though warned not to do so, continued to publish the revised *Fruits of Philosophy* without interference.

Prior to the London trial, the American freethinker and birth control advocate Edward Bliss FOOTE (1829–1906) published a book titled *Medical Common Sense* (1864) that included much better information on contraception than that offered by Knowlton. Foote discussed at length four methods that he claimed to have invented: (1) the "membrainous envelope," a type of condom made from fish bladders; (2) the "apex," a rubber penis cap; (3) a "womb veil," a rubber diaphragm; and (4) an electromagnetic preventive machine that supposedly altered the partner's electrical conditions during intercourse. The first three would have been as effective as any other means of birth control then available; the fourth is indicative of the great degree to which quackery pervaded much nineteenth-century medical practice. Foote's wife, Dr. Mary Bond Foote, was also a freethinker and an advocate for birth control, as was his son, Edward Bond FOOTE.

Though the passage of the Comstock Act (see COMSTOCK, ANTHONY, AND UNBELIEF) prevented Foote from sending his book through the mail, and though many states enacted their own laws against the dissemination of contraceptive information, *Medical Common Sense* still managed to attain steady sales, reflecting bootlegging of copies into other states and Foote's own sales of the book in New York.

Probably the most notorious of the freethinking birth control advocates was Emma GOLDMAN, who used lectures on birth control to attract audiences for her more radical views on the social reorganization of society (see ANARCHISM AND UNBELIEF). She also issued pamphlets

based on Foote and others. She was later expelled from the United States; for a time she lived in Russia, where she became disillusioned with Stalinism, and she finally settled in Canada, where she died.

Margaret SANGER, the daughter of a freethinker and in her early years a radical socialist (see SOCIALISM AND UNBELIEF) as well as a freethinker, was the dominant voice for birth control in the United States during much of the twentieth century. The culmination of her career was her sponsorship with Katherine McCormick of the research that led to the development of the commercial birth control pill by another freethinker, Gregory Pincus.

Ben Reitman, a freethinker and radical, complained in a poem that "the physicians, Social Scientists, Clergy & etc." only became interested in birth control "after the radicals had broken the ground. And gone to jail." He was essentially correct. The history of birth control in the United States, England, and elsewhere demonstrates that the vanguard in propagating information about conatraceptives was made up of freethinkers, secular reformers, utopians, sex radicals (see SEX RADICALISM AND UNBELIEF), socialists, and others. Effective birth control and, later, safe and effective abortions are among the major contributions to society for which freethinkers deserve primary credit.

At the beginning of the twenty-first century, some churches still remain hostile to information about sex and the dissemination of contraceptives. Yet even in the conservative Roman Catholic Church, there is strong lay support for contraception and even for abortion rights. Though freethinkers were probably the dominant force, it would be a mistake to think they were alone in their efforts to change attitudes about contraception and abortion. They were often joined by individuals and even groups representing organized religion, and by members of such groups as the Quakers, Unitarians (see UNITARIANISM TO 1961), Episcopalians, Unitarian Universalists (see UNITARIAN UNIVERSALISM), and others.

BJØRNSON, BJØNSTJERNE. See NORWAY, UNBELIEF IN.

BLAKE, LILLIE DEVEREUX (1833–1913), American suffragist, novelist, and freethinker. Lillie Devereux Blake's critique of Christian belief systems resulted from her feminism. In novels, essays, and lectures, Blake exposed "all the false arguments which [Christian] enthusiasts" have brought to the subjugation of women.

Blake was descended from Puritan divine Jonathan Edwards, to whose essays she responded, "What wretched hair-splitting!" Raised by her widowed mother in New Haven, Connecticut, Elizabeth Devereux married attorney Frank Umsted in 1855, bore two daughters, and lost her husband to an apparent suicide in 1859. She then worked as a journalist and novelist. She married Grinfill Blake in 1866, settling in New York City. By the 1870s Lillie Blake had become a highly successful lecturer and political organizer for the suffrage and labor movements (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF). She initiated actions that led to the founding of Barnard College of Columbia University, and she attained such prominence in the woman suffrage movement that in 1900, Elizabeth Cady STANTON supported her to succeed Susan B. Anthony as president of the National American Woman Suffrage Association.

Blake's childhood world was populated by Christian apologists. Her cousin, Yale University president Theodore Woolsey, lectured on the positive effects of Christianity on the social position of women. But Blake early rebelled against what she termed "this man-made Church" that degraded rather than uplifted women; the nonbelieving heroine of her first novel, *Southwold* (1859), denies that women "owe any special debt of gratitude to Christianity. . . . I can scarcely imagine it to be necessary to the maintenance of a true faith that we should believe all the false arguments which enthusiasts have adduced in its support."

In 1883 Blake was enraged by Reverend Morgan Dix, rector of New York City's Trinity Church, who argued that the status of women was elevated by the teachings of the Christian Church. Blake referred to him as "this clerical dictator." Each Friday in Lent Dix lectured, and each Sunday evening Blake responded. To packed halls,

she refuted him on historical fact and peppered her own history of woman's condition with citations from Livius, Quintilian, and Valerius Maximus. She correlated the contraction of woman's status with the rise of the celibate priesthood, arguing that in order to sustain "this hideous doctrine . . . women were declared to be by nature inferior, to be unfit to associate with men, to be unworthy and degrading in their influence. . . ." Her lectures were published as *Woman's Place To-Day.*

In 1886 Blake collaborated with Elizabeth Cady Stanton on *The Woman's Bible*, which contextualized biblical stories with non-Christian cultural myths and may well have found its inspiration in *Woman's Place To-Day.*

GRACE FARRELL

BLANSHARD, BRAND (1892–1987), American philosopher, son and grandson of Protestant clergymen. Only midway through his graduate studies did Brand Blanshard abandon his plan to make a career in the ministry. Educated at Michigan, Oxford (as a Rhodes scholar), Columbia, and Harvard, he taught philosophy at Michigan, Swarthmore, and Yale. During the middle decades of the twentieth century he was the only American philosopher of the first rank to subject Christian thought to detailed yet respectful criticism. Other philosophers at elite universities who won highest honors in the profession either ignored religion or dismissed it in brief polemics. Blanshard painstakingly marshaled thousands of cogent arguments in lucid and graceful prose. A love of sermons developed in childhood showed in all his writing. Sharply critical of logical empiricism and linguistic analysis, the forms of philosophical analysis dominant in his time, Blanshard's own brand of analysis was universally respected as subtle and penetrating. Still more atypical in the mid-twentieth century, his analytic method was employed in the construction of a philosophical system comparable in scope to the systems found in earlier centuries of Western philosophy. He was both a sage of old and a master of twentieth-century logical techniques.

Central to Blanshard's philosophy of religion was an "ethics of belief." Although he was critical of William James as too permissive of belief beyond the evidence, he stressed more than William K. CLIFFORD did the need to act on probabilities and working hypotheses. "The indulgence" of belief "when not under constraint by the evidence is defensible on neither moral nor rational grounds." His advocacy of "the rational temper" avoided the excesses of skepticism often found in the history of "RATIONALISM."

Blanshard's intention was never to debunk all forms of religion. Rather, he wished to formulate naturalistic concepts of the religious. Fundamental to his notion of naturalistic religion was "the service of REASON." God, for him, was not an existent being but rather "the immanent end which realizes or incarnates itself in the process of advance." Religion is "man's attempt to adjust himself to ultimate reality." This, he said, "leaves religion with meaning and importance; it keeps reverence alive, even while redirecting it . . . and makes religion not only a live option but an unavoidable one."

PETER H. HARE

BLANSHARD, PAUL (1892–1980), American writer and crusader for liberal causes. Paul Blanshard was born on April 27, 1892, along with his twin, Brand, who went on to a distinguished career as a philosopher at Yale Univer-

sity. The twins' parents died when they were very young, and they were brought up by their father's family, who were strict Methodists. Despite this, the twins grew up firmly committed to liberal causes and values. They graduated from the University of Michigan in 1914 and Paul began a restless search for his place in the world. He was for a while a Congregationalist minister, as his deceased father had been. He was then a student at Union Theological Seminary before rejecting Christian belief altogether. Blanshard described himself as a "humanist atheist" (see ATHEISM; HUMANISM).

Having abandoned organized religion, Blanshard worked for several years in the union movement before moving to New York, where he worked for Mayor Fiorello LaGuardia and oversaw the prosecution of many corrupt Tammany politicians. During World War II, Blanshard worked for the State Department as an adviser on the situation in the West Indies.

Blanshard's reputation was made with his controversial book *Freedom and Catholic Power* (1949), which argued that the dogmas of Roman Catholicism are incompatible with democracy and pluralism. After ten publishing houses rejected it, Beacon Press, owned by the Unitarian Church, agreed to publish the book. Despite the refusal of most important media outlets to review it, *Freedom and Catholic Power* generated a storm of controversy and sold more than a quarter of a million copies in hardcover alone. A revised version was sold in Great Britain in 1951, but generated less controversy there. The Roman Catholic Church vigorously opposed the book and placed it on its Index of Forbidden Books.

Blanshard went on to write fourteen more books, but none achieved the publicity of *Freedom and Catholic Power*. He wrote several sequels, which focused on Catholicism in various parts of the world and replied to his critics. Other works included *The Right to Read* (1955), a criticism of censorship; *God and Man in Washington* (1960); an edited work called *Classics of Free Thought* (1977); and, in 1973, an autobiography. Paul Blanshard died in St. Petersburg, Florida, in 1980, aged eighty-seven.

BILL COOKE

BLASPHEMY. The core meaning of *blasphemy* is a legal or moral offense consisting of statements that disparage a deity, the deity's attributes, or some person or object considered sacred because of close association with a deity (such as Muhammad or the Bible). Those who deny the existence of deities are, therefore, inclined to regard blasphemy as a victimless offense. However, until recently most persons and societies have considered blasphemy a very serious wrong meriting severe punishment. Indeed, Leviticus 24:16 prescribes death by stoning as the punishment for blasphemy, and Thomas Aquinas characterized blasphemy as the greatest sin.

Blasphemy in Early Cultures. Although necessarily scant, there is evidence that many early cultures regarded statements expressing contempt for a deity as, at best, highly inadvisable and, at worst, a grave offense. The Egyptian Book of the Dead specifies a list of actions that the deceased must assert he has not committed if he hopes to gain immortality. Among other things, the deceased must assure Osiris that he has "not blasphemed a god." Legal codes from ancient cultures are only partially preserved, so it is difficult to discern the extent to which blasphemy was considered a crime or how severely it was punished. However, fragments from an Assyrian code suggest it was a very serious crime, as a false accusation of blasphemy resulted in the accuser being beaten with a staff forty times. On the other hand, the Code of Hammurabi contains no prohibition of blasphemy. Whether this implies that blasphemy was not regarded as an unlawful act or that blasphemy was addressed by other means (for example, by religious tribunals) remains unclear. One problem in determining the extent to which blasphemy was considered a crime in early cultures is that these societies usually did not have anything resembling what we would consider a comprehensive criminal code. Another problem in determining the extent to which blasphemy was punished is that there was often no clear distinction between blasphemy and sacrilege, which encompasses any action offensive to a deity, such as stealing from a temple.

The Old Testament indicates that the ancient Jews considered blasphemy a serious offense. In Jewish thought, the gravity of blasphemy was connected to the sacred character of God's name. To invoke God's name inappropriately was bad enough; to curse God was a horrific act. Moses decreed death by stoning as the appropriate punishment for "he who blasphemes the name of the Lord." Significantly, this penalty applied equally to foreigners and to the Jews themselves. The Old Testament also indicates how a false accusation of blasphemy could be used for nefarious ends. King Ahab and his wife, Jezebel, were able to have Naboth killed and secure his land by bringing against him trumped-up charges of blasphemy (Kings 21: 8–14). One might think that since their own scriptures confirmed how easily a charge of blasphemy could be misused, the Jews would be reluctant to continue to treat blasphemy as a capital crime, but apparently, the risk of offending the deity outweighed the dangers of a law so liable to abuse.

Surviving myths and stories from ancient cultures strongly suggest that blasphemy was highly disfavored even when not subject to criminal proscription. In the

Sumerian epic of Gilgamesh, the friend of Gilgamesh, Enkidu, is killed after the two heroes insult the goddess Ishtar. Numerous Greek myths (such as the myths of Arachne, Niobe, and Pentheus) also attest to the severe consequences that follow from uttering words that show disrespect for a deity. Interestingly, however, in these myths it is the deity that exacts punishment. Indirectly, these myths present one of the paradoxes of blasphemy when it is made a crime against human laws: If blasphemy offends a deity, why not leave it to the offended deity to impose punishment? Indeed, it would seem blasphemous to suggest that a deity cannot assume responsibility for defending him or herself.

Blasphemy Prosecutions in Greece And Rome. One justification for human punishment of blasphemy is that the blasphemer places his or her community at risk, for example, if the offended deity no longer supports the community that harbors the blasphemer. This rationale appealed to the Greeks and Romans of classical times, who emphasized the need to maintain a harmonious relationship with their numerous deities. If the community encountered disasters, an angry deity was the likely explanation for these unfortunate events, and it was believed that deities, much like their human worshipers, were angered by insults. Blasphemers had to be punished for the sake of the community.

One of the earliest examples of a law punishing blasphemy was the Athenian decree adopted at the urging of Diopeithes around 440 BCE. This decree prohibited "impiety," which encompassed denying the existence of the gods and explaining celestial phenomena without reference to the gods. Several prominent philosophers, artists, writers, and scientists were prosecuted under this law, including Anaxagoras, PROTAGORAS, and EURIPIDES. The prosecution against Euripides was unsuccessful; Anaxagoras was either imprisoned or exiled; Protagoras was either exiled or condemned to death, and died by drowning after fleeing Athens. The principal motivations for both the decree and the various persecutions appear to be the stresses experienced by Athens during this time (including, of course, the Peloponnesian War) and the very public religious skepticism of certain individuals. The two sets of phenomena were linked in the minds of many. Just as contemporary fundamentalists in the United States attribute everything from AIDS to tornadoes to taking "God out of the classroom," so too ancient Athenians were likely to attribute perceived social ills and natural disasters to "impiety." Socrates was the most famous victim of this law. As is well known, he was convicted and sentenced to death. Less well known is that about seventy years later, in 323 BCE, Aristotle was similarly charged with impiety; he fled Athens so "Athens would not sin against philosophy twice."

For most of Rome's existence as a city, nation, and empire, Roman law was much more concerned with magic and sacrilege than blasphemy per se. Extant provisions of the Twelve Tables are silent on blasphemy, although they provide the death penalty for anyone who sings or composes an incantation that harms another. It was not until fairly late in the imperial era that references to anything resembling a prohibition on blasphemy can be found in Roman legal treatises. However, one should not be too quick to infer that blasphemy, understood as an insult to the gods, went unpunished by the Romans merely because no specific prohibition of it can be found in earlier law. Although Roman civil law, dealing with property, marriage, and the like, was impressively detailed, Roman criminal law was not. Magistrates had wide discretion not just with respect to punishment, but also with respect to what could be regarded as a criminal offense. Moreover, criminal charges were typically not initially lodged by a government official. Private persons brought the charges.

The persecution of Christians must be understood in this context. Christians were subject to criminal prosecution even though, until the time of Decius, there were no specific laws directed against Christianity and only the vaguest of legal references to offenses against the gods. As scholar Geoffrey E. M. de Ste. Croix has noted, it is a mistake to look for an express legal foundation for the early persecutions of Christians. The only foundation necessary was "a prosecutor, a charge of Christianity, and a governor willing to punish on that charge." Christians were persecuted because they were Christians, or, to be more precise, because as Christians they openly proclaimed either that the pagan gods did not exist or, more commonly, that the pagan gods were demons, not deities. These insults to the gods earned them the enmity of the vast majority of the population, who thought it critical to keep the deities in a favorable state of mind.

An understanding of Roman law is useful for analyzing the purported trial and execution of Jesus of Nazareth (see JESUS, HISTORICITY OF). Given the accretion of myth and legend surrounding this story, it is unlikely we will ever have any certainty about what actually happened. Those who accept the story in the Gospels of Mark and Matthew insist that Jesus's trial before the Sanhedrin was the most infamous blasphemy case in history. Others point out that nothing Jesus reportedly uttered would have been regarded as blasphemous under Jewish law; that he did not receive the penalty for blasphemy under Jewish law (stoning); that the Sanhedrin had not previously tried anyone for blasphemy; and that the Romans, who executed him though crucifixion, would hardly have been troubled by blasphemy against a Jewish deity. Their conclusion is that Jesus, if he was executed at all, must have been executed because of a political crime against Rome. Reviewing what objective evidence there is, it does appear that the blasphemy charge is probably a fiction, explicable as a backward projection of early Christian theology. However, this does not imply that Jesus must have been some sort of political revolutionary, guilty of sedition or treason. The reality is that given the discretion Pilate

had, he could have executed Jesus merely because he was convinced Jesus was disturbing the peace of his province.

Blasphemy under Christianity. Christianity eventually became the official religion of the Roman Empire, and it almost immediately used its position to oppress those who refused to accept church doctrine. Both HERESY and blasphemy became crimes. The Code of Justinian (529 CE) provided the death penalty for blasphemy and in doing so explained that failing to punish blasphemy would provoke God's wrath. Although this code was officially enforced only in the Byzantine Empire, it influenced Christian states in the West as well. From the early Middle Ages until the Enlightenment, blasphemers were severely punished, although they sometimes escaped death. Alternative penalties included cutting or slitting the lips or cutting out the tongue.

Thomas Aquinas provided a succinct rationale for the severe punishment of blasphemy. He argued that blasphemy is a greater sin than murder because it is committed "directly against God" whereas murder is merely "a sin against one's neighbor." Of course, the blasphemer cannot actually harm the deity, but this does not matter because "the gravity of a sin depends on the intention of the evil will rather than on the effect of the deed." In this passage, Aquinas manifests the thought process of many religious believers through the ages.

The Reformation did not diminish the severity with which blasphemy was punished. In fact, early Protestants brought at least as many blasphemy prosecutions as Catholics did, in part because Protestants generally disfavored accusations of "heresy"—this was, after all, the accusation Catholics made against them. Thus Protestants tended to characterize unacceptable religious views as blasphemous rather than heretical. The distinction presumably made little difference to those executed, maimed, or imprisoned for making assertions regarded as offensive to the Christian deity. Fire burned as hot for blasphemers in Protestant lands as it did for heretics in Catholic lands.

Blasphemy in Great Britain and the United States. The seventeenth century witnessed two developments in blasphemy law in Britain, one of which was to have important implications for blasphemy law in the United States. First, both England and Scotland adopted statutes making blasphemy a crime. The Scottish statute, adopted in 1661, resulted in the last execution of anyone for blasphemy in Great Britain. Interestingly, Thomas Aikenhead, the unfortunate person executed in 1697, was not properly prosecuted under the statute, since the law forbade an *unrepentant* denial of the Trinity or God and Aikenhead, a deist (see DEISM), had recanted following his arrest. England adopted its own statute prohibiting blasphemy in 1695.

This law remained in force until 1967, but its repeal was meaningless because, curiously, no one had ever been prosecuted under the statute. Instead, blasphemers were prosecuted in England under the common law, that is, judge-made law. In the notorious case of John Taylor in 1676, Thomas Hale, the chief justice of England, decided that Taylor could be punished for calling Christ a "whore-master" and religion a "cheat" because Christianity was "parcel" of the English common law. Hale's reasoning was obscure, but whatever the weakness of his reasoning, blasphemy became an English common law crime, which it remains to this day.

Scores of English men and women have been prosecuted for blasphemy since Hale's decision. None of these was executed, but some did suffer significant terms of imprisonment. In the early 1800s Richard CARLILE spent six years in prison for blasphemy; his principal offense was publishing and selling Thomas PAINE's *Age of Reason*. One interesting aspect of Carlile's case is that during this litigation, the crown adopted a new rationale for punishing blasphemy. Blasphemy was held to be a crime not because it offended a deity but because it sapped the faith of the lower and illiterate classes and threatened to undermine accepted morality. This rationale could have been provided by Karl MARX.

Because English common law was accepted in the United States, except where modified by statute, blasphemy was initially regarded as a common law crime in the United States as well. Some early decisions (such as the 1811 New York case *People v. Ruggles*) stated that blasphemy could be prosecuted because, and only if, the blasphemer expressed his thoughts offensively. Blasphemy laws did not inhibit free speech, but rather prevented disturbances of the peace. (Ruggles had called Jesus a "bastard" and his mother a "whore.") However, later blasphemy cases were brought against individuals who did not simply insult or ridicule accepted deities. In the 1838 case of *Commonwealth v. Kneeland*, writer and lecturer Abner KNEELAND was convicted of blasphemy even though he had expressed a reasoned disbelief in the divinity of Jesus and in miracles.

Overall, the number of blasphemy prosecutions and convictions in the United States was far fewer than in Britain. The last American blasphemy conviction of any significance occurred in 1928 when Charles Lee SMITH, the president of the AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF ATHEISM, was convicted in Arkansas. However, he never served his ninety-day sentence and the charges were eventually dropped.

It is important to bear in mind that earlier in American history, states could prosecute blasphemy despite the First Amendment because the Bill of Rights did not apply to the states. In other words, the First Amendment restrained the actions of the federal government only. However, once the Supreme Court began to apply the Bill of Rights to the states—a process that started in 1925—blasphemy laws effectively became dead letters. In 1970 the Maryland Court of Special Appeals found Maryland's blasphemy statute unconstitutional precisely because it conflicted with the First Amendment.

As indicated, blasphemy remains illegal in England. Indeed, the law has arguably become more strict in recent decades. In the 1883 prosecution of freethinker George William FOOTE, the courts appeared to declare that a person could be convicted of blasphemy only upon a showing of intent to shock or outrage. English courts in the 1977 *Gay News* case (see GAY HUMANISM) repudiated that interpretation of the law, holding that intent to shock or outrage was not an element of the crime. (The convicted publisher in *Gay News* had printed a homoerotic poem depicting Jesus receiving fellatio.)

The *Gay News* case led to a number of efforts to repeal the law on blasphemy in England. To date, all have been unsuccessful. Indeed, some in England have argued for expanding the law so that all religions are protected. As the Salman Rushdie affair reminded many, in England only remarks that offend Christians are prohibited. The rationale offered by those who favor retention or expansion of the law is that the sensibilities of all religious believers merit protection from offensive statements.

The Contemporary Situation. England is not the only Western democracy that retains a law penalizing blasphemy, but fortunately, for the most part these laws are now legal relics. They remain potential hazards, but they cannot be regarded as posing much of an actual threat to free speech.

Unfortunately, the same cannot be said for other countries, especially Islamic countries. Even relatively progressive Islamic countries, such as Malaysia, retain and enforce blasphemy laws. The rigor with which blasphemy laws are enforced in these countries varies greatly, but prosecutions are frequent enough and penalties severe enough to present a grave danger to freedom of conscience. For example, since 1986, when its current blasphemy law was adopted, more than four thousand people have been accused of blasphemy in Pakistan. Some have been convicted and sentenced to death (although no death sentence has been carried out). Iran has the most intolerant regime, with hundreds of individuals convicted of blasphemy since the Khomeini revolution of 1979; dozens have been executed. Justifications of laws against blasphemy in Islamic counties are not typically based on the more modern rationales of the need to preserve peace or protect the religious from offense; rather, they hark back to the medieval and ancient views that statements disparaging a deity are intrinsically evil. These harsh sanctions serve as a reminder that FREETHOUGHT and free speech are at risk whenever there are those who remain in thrall to the supernatural and believe that failing to respect their deities is the greatest sin.

RONALD A. LINDSAY

BOLINGBROKE, LORD (HENRY ST. JOHN, VISCOUNT BOLINGBROKE; 1678–1751), English politician and deist. Alive, Henry St. John was a controversial politician. Secretary of state in Queen Anne's Tory ministry, he condemned himself to a life of exile and opposition when, an opponent of the Hanoverian succession, he fled to France in 1715 in support of the Jacobite cause. Dead, Lord Bolingbroke provoked even more controversy when the posthumous publication in 1754 of his collected works proved the extent of his philosophical unorthodoxy. In the *Letter to Mr. Pope* that introduces his philosophical writings, Bolingbroke explains that he is not a "freethinker"; that is, he does not think that men have the right to create instability in a country by freely publishing their thoughts. They are free to *think* them, but not to *publish* them, which is why he never did so in his lifetime. Despite his hostility to organized religion, Bolingbroke considered it useful socially and politically, and he did not encourage law breaking.

Bolingbroke defined himself as a "theist," in opposition to "divines" on the one hand and "atheists" on the other (see ATHEISM), but his central convictions were broadly in line with the tradition of DEISM.

Bolingbroke's philosophical writings were composed as a series of conversational and ironic "essays" and "fragments." Some of these were addressed to the poet Alexander Pope, and heavily influenced Pope's *Essay on Man*. In his writings Bolingbroke asserted that we cannot know more of God than can be inferred from the natural world. "Revealed religion," to which we have access through the Bible, is untrustworthy and implausible. The Bible is not incontrovertibly the word of God, because it does not stand the test of reason. Those whom he called "divines," by which he usually meant clergymen of all Christian communions, have erected upon the Old Testament and the early Christian gospels a body of doctrine—"artificial religion"—that is self-serving and obscurantist. Bolingbroke dismissed much organized religion as a trade carried on for the profit of its practitioners. He anticipated later thinkers such as Karl MARX in arguing that in all organized faiths, one set of views is purveyed to ordinary believers and an entirely different set of views is actually believed by the hierarchs. An Englishman of his time, Bolingbroke was especially

quick to spot examples of pious fraud in Roman Catholicism, though he was equally hostile to the biblical claim of Jews to be a chosen people.

Paragraph 42 of the *Fragments* offers a good example of Bolingbroke's characteristic style and content. Opposing the view promulgated by the Newtonian physicotheologists that the discomfort of this world can only be justified if there is a perfect world beyond the grave, Bolingbroke contends that this is impiety, because it implies that God owes us something. In a wide scholarly sweep that embraces LUCRETIUS, Ovid, PLATO, Michel de Montaigne, and Pliny, Bolingbroke argues that the hopefulness and the hopelessness of the human condition are routinely exaggerated, and that the truth lies in a middle position.

God's attributes, Bolingbroke everywhere contends, are unknowable. Our knowledge of God does not extend beyond the evidence of the created universe, and does not form a basis for the moral law. Self-love guided by reason leads men to benevolence and sociability, not the promise of judgment and eternal happiness beyond the grave.

BREAN HAMMOND

BONNER, HYPATIA BRADLAUGH (1858–1935), British editor, lecturer, and activist. Though a significant exponent of unbelief in her own right, as the only surviving child of Charles and Susannah BRADLAUGH, Hypatia is chiefly remembered for supporting her father in life and death.

She was born in Hackney, London, on March 30, 1858, two years after her sister, Alice, and educated at private London schools and in Paris. When the family split up in 1870, Susannah and the girls went to live with grandparents in Sussex, but came to London alternately to give Charles secretarial help. After Susannah died in 1877 they lived with Charles in St. John's Wood, London.

Bradlaugh hoped Hypatia would read law at London University, and she studied law privately, but at the City of London College she took political economy and, under Edward Bibbins AVELING, science, before women were excluded. In 1879 Aveling established formal classes under Science and Art Department auspices at the NATIONAL SECULAR SOCIETY's Hall of Science, and Hypatia studied botany, Latin, and chemistry, also acting as secretary. In 1881 she matriculated and was recognized as a teacher of mathematics and chemistry, publishing four lectures as *Chemistry of Home* (1882). As mathematics teacher and student union vice president she met student Arthur Bonner and married him in June 1885. He became Charles Bradlaugh's printer, and she bore two sons: Kenneth, who died in infancy, and Charles.

Already a National Secular Society (NSS) vice president and congress delegate, she joined the NSS's corps of lecturers and wrote for her father's *NATIONAL REFORMER* and Annie BESANT's *Our Corner*. The Bonners also loved music, art, and literature, and Hypatia wrote children's stories, collected in 1886. She lost her elder sister, Alice, in 1888 and her father in 1891; so, as Aveling and Besant had also departed, she closed the Hall of Science classes. From Bradlaugh the Bonners inherited the Freethought Publishing Company, and its debts. They managed to pay these, but the *National Reformer* folded in 1893. Disliking George W. FOOTE, Bradlaugh's successor as president, Hyatia left the NSS in 1891. In defending her father's memory, she quarreled with Foote, George Jacob HOLYOAKE, and Joseph MCCABE.

In 1897 she established and edited a monthly, *Reformer*, which lasted until 1904. She was on the executive of the nonviolent female-suffrage Women's National Liberation Federation, the International Arbitration and Peace League, and the Humanitarian League, and in 1910 became founding chair of the Rationalist Peace Society (RPS), an independent offshoot of the RATIONALIST PRESS ASSOCIATION (RPA), for which she was a principal lecturer. World War I caused dissension within the RPS, suspension in 1917, relaunch in 1918, and dissolution in 1921.

She became an RPA honorary associate in 1912 and a director in 1916. A persistent campaigner against British BLASPHEMY laws, she wrote *Penalties upon Opinion* (1912). When her voice failed in 1924 she ceased lecturing, but served as a London magistrate from 1921 to 1934. She died in Tooting Bee, London, on August 25, 1935, four years before Arthur.

DAVID TRIBE

BOSTON INVESTIGATOR. This American liberal newspaper was founded in February 1831 by Abner Kneeland, a former Baptist minister who had lost his faith and become an agnostic (see AGNOSTICISM) and liberal. Prior to establishing the *Investigator*, Kneeland had been an active Universalist (see UNIVERSALISM TO 1961). He edited the Philadelphia *University Magazine* between 1821 and 1823 and the *Olive Branch* in 1828. Soon after his arrival in Boston at the end of 1830, Kneeland launched the *Boston Investigator* with the general aim to "improve the condition of Man." This would be done by exposing corporate and government fraud, airing criticism of monopolies, and advancing causes such as the abolition of slavery, women's emancipation, and the rights of the working classes.

In 1834 Kneeland served a prison term for BLASPHEMY. His actual crime was to say publicly that he did not believe in God. While Kneeland was in prison the *Investigator* was run by Horace SEAVER, a native Bostonian. Seaver was an atheist and materialist in the manner of Ludwig BÜCHNER and a man proud of his working-class roots. When Kneeland abruptly retired as editor in 1838, Seaver began an extraordinary fifty-year period as editor, retaining the post until his death. Much of this time he coedited the *Investigator* with J. P. MENDUM, who became sole owner of the paper in 1840. After Seaver's death, Lemuel K. WASHBURN took over the position, becoming the third and last editor of the *Investigator*. Washburn had for many years been a Unitarian minister before losing his faith and becoming a freethinker in the manner of Robert Green INGERSOLL and Thomas PAINE. But by now the *Investigator* was struggling to bring in a new generation of readers. Washburn supplemented his, and the *Investigator*'s, income through much of the 1890s by lecturing to FREETHOUGHT societies. Changing times began to take their toll on the paper, which suspended publication on July 30, 1904, and turned its subscription list over to *THE TRUTH SEEKER*.

The *Boston Investigator* was an extraordinary achievement. Over its seventy-three-year life, the paper had only three editors and as a result was able to achieve a remarkable continuity. Ingersoll once said that the distribution of the *Investigator* was what made it possible for him to travel around the country and lecture on freethought.

BILL COOKE

BRADLAUGH, CHARLES (1833–1891), English atheist, reformer, and politician. As Britain's leading secularist (see SECULARISM) and an inspiration for similar movements in other countries, Charles Bradlaugh stands in the forefront of world freethinkers. Through his legal struggle to take his parliamentary seat; his leadership of the secularist wing of British republicanism, which advocated abolition of the monarchy, the House of Lords, and other manifestations of hereditary privilege; and his trial with Annie BESANT for publishing a contraceptive manual, he colors British political and social history.

Early Life. The eldest of seven children, Charles was born to a solicitor's clerk and a former nursemaid in Hoxton, London, on September 26, 1833. Sent to a brutal British Quaker school and two private schools until he was eleven, he received little formal education beyond the "four Rs." He found work as an office boy, wharf clerk, and cashier to a coal merchant, and was a Sunday school teacher at the local Anglican church. For a confirmation visitation by the bishop of London, its priest in charge asked him to study the Thirty-nine Articles of the Anglican faith. He conscientiously extended his study to their biblical source and found discrepancies, which he asked his pastor to explain. Branding this questioning as ATHEISM, the Reverend J. G. Packer suspended him from Sunday school duties. Absenting himself from church, too, Bradlaugh spent Sundays with Chartists and Owenites (see OWEN, ROBERT), who debated political and religious themes. They gave him Robert TAYLOR's deistic *Diegesis* (1829), which he sent to Packer for comment. Instead he received an ultimatum to change his views within three days or lose his home and job. Before the time was up, he left both.

He found refuge with an old Chartist and then the widowed partner of atheist republican Richard CARLILE. Eliza Sharples (see CARLILE, ELIZA SHARPLES) ran a coffee room in front of a temperance hall, where Bradlaugh socialized with radical freethinkers, lost his Christian faith, and embraced teetotalism. One new friend was James Savage, who taught him Hebrew to facilitate his biblical studies. Savage knew the well-known Chartist and Owenite George Jacob HOLYOAKE, who chaired Bradlaugh's first lecture on the past, present, and future of theology. He had also begun to write and distribute political poems and anti-Christian tracts, but his first bylined publication was *A Few Words on the Christians' Creed* (1850). To earn a living he set up as a coal merchant, but lack of capital and his infidel reputation killed the business. Selling buckskin braces for an admirer was equally profitless, and he fell into debt. Greatly influenced by Ralph Waldo EMERSON's essay "Self-Reliance" (1841) he declined charity and in December 1850 took the "Queen's shilling" (actually six pounds, ten shillings) and joined the Seventh (Princess Royal's) Dragoon Guards, stationed in Ireland. There he saw the oppression of British imperialism and first became an advocate of Irish home rule within the United Kingdom. Resenting military drill and discipline, he found life tolerable only through friendship with an army schoolmaster and poet, James Thomson. He had become reconciled with his par-

ents, and his widowed mother purchased his discharge with a legacy in 1853. Mellowing afterward, he applied military discipline to his political demonstrations and steadfastly supported soldiers' rights.

Making a Mark. Back in London Bradlaugh found that Holyoake had launched a new movement to take the place of both Chartism and Owenism, which were in terminal decline. This was SECULARISM, a reformist and ethical commitment to "this world" as the only one we know. Reversing his earlier positions, Holyoake now wished to avoid theological confrontation. Influential freethinkers disagreed with and were defrauded by him.

Bradlaugh obtained employment as an office boy with solicitor Thomas Rogers and rapidly rose to common-law manager. At Rogers's request, Bradlaugh adopted a pseudonym for his secularist propaganda and chose "Iconoclast," which he maintained until 1870. Earning one hundred pounds a year from Rogers and a building society, he felt able in June 1855 to marry Susannah Lamb Hooper, daughter of a freethinking republican father and conventional mother. Three children were born: Alice in 1856, Hypatia in 1858, and Charles in 1859.

After years of neutrality within the secularist movement, Bradlaugh took the side of Robert Cooper and other dissidents against Holyoake. In 1858 he became editor of Cooper's *Investigator* and president of the London Secular Society after Holyoake resigned. Thereafter the secularist movement adopted Bradlaugh's radical anticlerical stance. A profession of atheism was never required for secularist membership. Bradlaugh himself said, "I do not deny God," and sometimes—after Baruch SPINOZA and Ernst HAECKEL—called himself a monist, monism being a naturalism that posits the physical as the sole realm that exists, contrary to dualism or pluralism. Yet Bradlaugh always said that "atheist" best represented the freethought position. And he believed the movement should be actively engaged in popular protests and political demonstrations in support of civil liberties, neo-Malthusianism (family planning) promotion, and republicanism.

He supported French and Italian, and later Spanish and Russian, revolutionaries and was admitted to the Masonic *Loge des Philadelphes*, founded by Continental émigrés; but he still sought a legal career. While Rogers had allowed him to argue cases in court, though unqualified, when he asked to be articled for training as a solicitor, he was refused an eighty-pound loan to pay for his stamp duty, a necessary government registration fee. So he turned to a more obliging solicitor and company promoter, Thomas Harvey. He now felt able to leave the East End of London. Weekends were occupied with exhausting provincial lectures and debates. He always charged lecture admission and underwrote all expenses, which initially exceeded takings.

In 1859 the *Investigator* folded, but a Reformer Newspaper Co., Ltd., launched the *National Reformer*, with Bradlaugh and Joseph Barker as coeditors, in 1860. After much bickering over Bradlaugh's support for George Drysdale's contraceptive tract *Elements of Social Science* (1854), Barker was deposed and Bradlaugh became sole editor and, later, proprietor. In 1861 he left Harvey's employ just before the latter was imprisoned for debt, and joined Montague Leverson, another solicitor and company promoter. In 1863 he left Leverson just before, under investigation for fraud, the latter decamped. Realizing that an association with two disgraced solicitors meant the end of his legal career, he became a City "merchant," company secretary, insurance agent, loan broker, and general financier. In 1863, when "his health broke down," he handed over the *Reformer* editorship to a capable but uninspiring young freethinker, John WATTS, and joined his local Tottenham parish vestry and Masonic lodge in 1864. Unfortunately, in 1866 Watts fell terminally ill and Bradlaugh had to resume editorship. He also resumed political activism and became a founding vice president of the National Reform League, which sought to extend the franchise.

Years of Achievement. Most significant in 1866 was the formation of the NATIONAL SECULAR SOCIETY under Bradlaugh's presidency. As well as promoting freethought, the National Secular Society acted as coordinator for his political and legal agitation. This included defying "security laws" (which demanded costly bonds against seditious or blasphemous libels in newspapers) in 1868. His vigorous legal and journalistic fight against prosecution led to their repeal in 1869. Contemporaneously, in a civil action he obtained the right of unbelievers to affirm in law courts.

In 1870 his business finally failed, but he avoided bankruptcy and eventually paid off his debts. Most household contents were sold and the family split up. His wife, now alcoholic, and daughters went to her parents' home; his son to an army tutor; and he to two rooms in Stepney.

This was another year of revolutions in Europe, and Louis Napoleon was overthrown during the Franco-Prussian War. Bradlaugh supported Republican France and was invited to act as an unofficial mediator in peace talks between the Paris Commune and Versailles government in 1871. Yet greater challenges emerged at home, with an upsurge of republicanism inspired by France, fueled also by anger at the dissolute Prince of Wales and Queen Victoria's decade of costly nonperformance as the "widow of Windsor." Wishing to be "prepared for any event," Bradlaugh declined nomination as president of the National Secular Society; contrary to some accounts, it did not "collapse"; rather, it was transformed into a network of republican clubs. Bradlaugh became president of the London Republican Club and wrote a best-selling *Impeachment of the House of Brunswick*. In 1873 he was the National Republican League's emissary to Republican Spain and, during the first of three American lecture tours, the *New York Herald* proclaimed him

"[t]he Future President of England." It was very premature. The republican movement was a warring coalition of radicals, Christian socialists, social democrats, Marxists, anarchists, and adventurers that collapsed when Victoria regained popularity in 1874. Secularism then resumed centrality in his life.

This was when Besant, the separated wife of an Anglican clergyman, joined the National Secular Society, soon demoting lieutenants Charles WATTS and George William FOOTE. In 1876 a Bristol bookseller was prosecuted for selling a provocatively illustrated edition of Charles KNOWLTON's contraceptive tract *Fruits of Philosophy* (1832). The publisher was Watts, secretary of the National Secular Society and Bradlaugh's uncontracted subeditor, printer, and publisher. Arrested himself in 1877, Watts pleaded guilty to obscene libel against the wishes of Besant and Bradlaugh, and was summarily dismissed from the last three positions. Besant and Bradlaugh formed a Freethought Publishing Company to republish the (slightly modified) book, and were arrested, tried, convicted, and sentenced to six months in jail, but escaped on a legal technicality. Watts, Foote, and Holyoake then formed a British Secular Union, which just survived until 1884.

Despite this saga and three previous electoral failures (one in 1868 and two in 1874) as Radical candidate for Northampton, Bradlaugh was elected as one of Northampton's members of Parliament in 1880. When he asked to affirm rather than swear an oath of office before taking his seat, a select committee declared the 1869 reform, which permitted replacing oaths in law courts by affirmations, did not apply to Parliament. He then asked to take the oath, but another select committee said atheists were ineligible to swear an oath but that Bradlaugh should be allowed to affirm. After first rejecting this recommendation and imprisoning him, the House allowed it "subject to any liability by statute" (fines for voting without swearing). He then faced six years of self-conducted litigation, physical expulsion, another general election (1885), and three by-elections (1881, 1882, and 1884) before a new Speaker allowed him to take oath and seat in 1886.

Inside Parliament, his greatest success was the 1888 Oaths Act allowing universal affirmation; but he was largely responsible for the Royal Commission on Market Rights and Tolls (1887) to benefit small traders and consumers, and sat on the Royal Commission on Vaccination (1889) and Select Committees on the Employers' Liability Bill (1886), Perpetual Pensions for the aristocracy (1887), Immigration of Destitute Aliens (1888), and the Friendly Societies Act (1888). Internationally he was known as the "member for India," which he visited in 1889. It was believed that Gladstone intended to make him undersecretary of state for India.

He also advocated proportional representation, land-law and penal reform, international and industrial arbitration, colonial freedom, bimetalism, and a channel tunnel. But the issue which most occupied his final years was "scientific socialism." All his life he had optimistically promoted self-help and cooperative retail, building, benevolent, and insurance societies, so it was inevitable he would oppose both utopian socialism and MARXISM. While his opposition to an eight-hour workday and widespread government regulation of industry is now seen as reactionary, his criticism of the violent revolution, tyranny, censorship, lack of enterprise, and economic stagnation that he said would be consequences of socialism was prescient. He died of chronic renal disease and uremia on January 30, 1891.

DAVID TRIBE

BRANDES, GEORG MORRIS COHEN (1842–1927), Danish literary critic, scholar, and historian. Georg Morris Cohen Brandes was born in Copenhagen to middle-class nonreligious Jewish parents.

Though he received his master's degree in aesthetics from the University of Copenhagen in 1864, Brandes was refused the chair in aesthetics there in 1870 because, among other reasons, he was a well-known atheist. Afterward he worked as a lecturer and drama critic, becoming the principal leader of the naturalistic movement in Scandinavian literature.

Brandes introduced POSITIVISM and DARWINISM in Denmark and taught that the most significant literature in Germany, France, and England from 1789 to 1848 was indebted to the French Revolution, which had introduced the freedom of thought without which a significant literature could not thrive. His thought was influenced by Friedrich NIETZSCHE, John Stuart MILL, Hippolyte-Adolphe Taine, and Ernest RENAN, with whom he corresponded, resulting in a critical position about religion. When he wrote "Sagnet om Jesus" (Jesus, a Myth, 1925), his work provoked wide protests and gained him many enemies.

Even today his words are considered deeply controversial within conservative circles. Noteworthy passages include: "The Christian god is blood thirsty." "The working classes intend not to create a paradise of igno-

rance but a cultural and scientific one." "George Sand debates the question of marriages, VOLTAIRE, BYRON and FEUERBACH debate religion, PROUDHON private property. . . . Literature should be an organ of the great thoughts of liberty and progress of humanity. For a literature not to raise any question for debate is the same as for it to set out to lose all significance." "Writers should reject abstract idealism and work in the service of progressive ideas and the reform of modern society, deal with atheism, marriage, etc."

With his brother Edward, Brandes published the magazine *Det Nittende Aarhundrede* (The Nineteenth Century) between 1874 and 1877. His literary works include *Critiques and Portraits* (1870), *Main Currents in Nineteenth-Century Literature* (1872–90 and 1901–05), *The Contemporary French Aesthetics* (1870), *Naturalism in England* (1875), and biographies of Voltaire, GOETHE, Byron, Napoleon, Garibaldi, and others.

JOSÉ MANUEL FERNÁNDEZ SANTANA

BRANN, WILLIAM COWPER (1855–1898), American journalist. Founder and principal author of the *Iconoclast*, published in Waco, Texas, William Cowper Brann battled that state's Baptists until martyrdom ended his colorful life. He was born in Coles County, Illinois, the son of a Presbyterian minister; however, after his mother died when he was only two, he was taken to be raised by a local farm family. Brann left the farm at age thirteen, carrying a single box of his belongings. He worked a variety of jobs until his natural talent for language secured him a position as a newspaper reporter and, later, an editorial writer. Though the first thirty-nine years of Brann's life were marked by "the harassing annoyances of extreme poverty," a love of reading richly equipped his mind, which, combined with a fiery temperament, produced "an inexhaustible vocabulary, from which he could always find the words best fitted to convey his meaning at the moment they were most needed, and every sentence was resplendent with an order of wit, humor, and satire peculiar to a style original with himself."

Brann moved to Waco, Texas, where, after further work on newspapers, he commenced the publication in 1891 of the *Iconoclast* as a monthly magazine, which lasted only two faltering years. Successful engagements as a lecturer convinced him to revive it in 1895. Fiercely independent and sharply critical of many Texas and national institutions as well as outworn attitudes, this magazine soon attained a circulation of ninety thousand, with subscribers across the country and around the world.

Paralleling the ferment of the populist movement of that era, Brann attacked "plutocrats," the Associated Press ("the champion toad-eater of the universe"), and the anti-Catholic American Protective Association (the "Aggregation of Pusillanimous Asses"), as well as the locally powerful Baylor University, a theological center of the Baptist church. Dr. J. B. Cranfill, editor of the monthly *Baptist Standard*, was a leader of the anti-Brann faction.

Brann had an unusually colorful, complex, and contradictory personality: he was a self-proclaimed freethinker (see FREETHOUGHT) but had little use for ATHEISM; he defended Catholics and Jews but expressed a pathological hatred of African Americans. Finally, Brann's feud with Baylor provoked a beating and near lynching at the hands of an enraged mob of students in 1897, and the next year, his assassination on the streets of Waco. Brann's marble monument, featuring a carved profile and a lamp of "Truth," was later defaced by bullets.

FRED WHITEHEAD

BRECHT, BERTHOLT (1898–1956), German playwright and poet, and spokesman for the so-called Lost Generation whose lives were destroyed or ruined by World War I. Bertholt Brecht was born on February 10, 1898, in Augsburg, Bavaria, the son of a paper manufacturer. His education was in medicine but his heart was with the theater. Brecht was an early rebel against the bourgeois values with which he was raised. His experiences as a medical orderly in the last year of World War I only strengthened his sense of alienation.

In the years between the wars Brecht wrote some of the most powerful plays and poems of the period. Brecht understood the destruction of the old values the war had wrought, and, when at his best, articulated in their place a powerful, raw HUMANISM. In opposition to the tired nostrums of nation and religion, Brecht gave voice to an intense joy in the existential business of living (see EXISTENTIALISM). Works like *The Threepenny Opera* (1928) and *The Rise and Fall of the Town of Mahoganny* (1930) established Brecht's standing as one of Weimar Germany's leading playwrights and poets.

Brecht's left-wing politics and his role as cultural icon in Weimar Germany meant that he could not stay in Germany after the Nazis came to power. Within weeks of their accession, Brecht went into exile in Denmark. But that country's vulnerability to the Nazis forced Brecht to move once again, this time to Sweden in 1939, then to Finland the following year, and on to the United States via the Soviet Union in 1941.

The first years of Brecht's exile inspired another wave of important work, most notably *Galileo* (1938), *Mother Courage and Her Children* (1939), *The Good Woman of Szechwan* (1943), and *The Caucasian Chalk Circle* (1944). Brecht found life as an exile in the United States

difficult and, after a brush with the House Un-American Activities Committee in 1947, he returned to West Germany. However, he was denied permission to settle there and in 1949 he moved to East Germany, where he spent the rest of his life. His last years were sad ones, as he saw firsthand the reality of the Communist society he had spent his life advocating. After warning of the low value of Nazi poetry that lauded Hitler, he wrote similar material in praise of Stalin. Brecht died in East Berlin on August 14, 1956.

BILL COOKE

BRITISH HUMANIST ASSOCIATION, THE. The organization now known as the British Humanist Association (BHA) was founded in 1896 as the Union of Ethical Societies, soon becoming the Ethical Union, taking the name BHA in 1967. According to one of the early BHA activists, Dr. Peter Draper, "Humanists believe that this is our world, our responsibility, our possibility." It is within such very wide premises that the BHA operates (see HUMANISM).

In the 1950s there was a growing feeling that it was divisive and wasteful to have several organizations with similar ambitions operating side-by-side in British life. The Ethical Union approached the RATIONALIST PRESS ASSOCIATION (RPA) to negotiate cooperation, with Harold J. Blackham playing a leading role. A coordinating body called the Humanist Council was set up in 1950, encompassing the RPA, the Ethical Union, and the SOUTH PLACE ETHICAL SOCIETY (SPES); this was done on the initiative of Hector HAWTON, then connected with the SPES. In 1955 the RPA and the Ethical Union set up a Joint Development Committee; at the 1957 world congress of the INTERNATIONAL HUMANIST AND ETHICAL UNION (IHEU), held in London, a Humanist Association was formed in order to investigate amalgamation. Its members agreed on action on unilateral disarmament for nuclear tests, opposition to racial discrimination, and support for work on behalf of underdeveloped countries.

There were obstacles to a merger, including the matter of how bequests meant for a constituent organization might flow to a new organization and whether the new organization would have charitable status (since British charity law does not permit a charitable body to undertake political activity). The Humanist Association was replaced in 1959 by a new body, which reverted to the earlier name of the Humanist Council, the only significant difference being that the NATIONAL SECULAR SOCIETY was briefly a member. By 1963 the RPA and Ethical Union decided jointly to sponsor a new British Humanist Association, with the RPA directing publications and the Ethical Union dealing with branch activities, conferences, and education. An inaugural meeting of the BHA took place on May 17, 1963, at the House of Commons, hosted by the sympathetic Member of Parliament Laurie Pavitt. Also in attendance were Sir Julian HUXLEY; philosopher Alfred Jules AYER; Baroness Barbara Wootton, a leading Labour member of the House of Lords; and Kingsley Martin, a well-known left-wing journalist and writer.

Administrative problems arose among the three cooperating organizations (the RPA, the Ethical Union, and BHA). There was the difference, which remained longstanding for the BHA, between those wanting action against religion (see ATHEISM; SECULARISM; FREETHOUGHT) and those prepared to go along with "ultimate concerns, religious humanism," spiritual humanism, and the like (see RELIGIOUS HUMANISM). The RPA withdrew when the Ethical Union lost its charitable status, and in 1967 the Ethical Union changed its name to the British Humanist Association. The long gestation preceding the birth of the BHA was finally over.

Among the early aims of the BHA were repeal of the Sunday observance laws, which prohibited the opening of shops and performances in theatres on Sunday; and reform of the 1944 Education Act's clauses on religion in schools, which enforced religious worship and religious education. More generally, the BHA wished to defend freedom of speech, supported the elimination of world poverty, and pressed for removal of privileges held by religious groups. In 1977 it was pronounced that the BHA "aimed to make humanism available and meaningful to the millions who have no alternative belief."

Harold Blackham, who can be considered the founding father of the BHA and was its first director, retired as director in March 1968. As a philosopher and organizer, a diplomat and plain speaker, he was a leading figure in British and world humanism in the twentieth century.

During its nearly forty years' existence the BHA continued a twin role of political lobbying and public reflection on philosophical—especially ethical—issues. It regained charitable status, to great financial advantage and without hindering any area of its activity. Its sumptuous premises in 13 Prince of Wales Terrace, Kensington, London, had been purchased by the Ethical Union after the sale of the Ethical Church in Bayswater, London. However there were later financial problems and the BHA moved to premises in Lamb's Conduit Passage as tenants of SPES, attached to Conway Hall (Red Lion Square, London), and then as tenants of the National Secular Society in Bradlaugh House in Theobald's Road in conjunction with the NSS, the RPA, and the IHEU. However, these premises were not considered adequate and the BHA moved (with the RPA and

the IHEU) in 2003 to 1 Gower Street (Bloomsbury, London) where it now remains.

An essential aspect of the BHA has been support of local groups (up to about one hundred at the peak), and the development of a network of humanist officiants able to offer nonreligious funerals, weddings, naming ceremonies, and gay and lesbian affirmations (see RITUAL, CEREMONIAL, AND UNBELIEF). Educational issues have been very important. There have been efforts to abolish daily worship in schools and to change legally required religious education (RE) in public schools so that it included something about humanism as an alternative LIFE STANCE (a phrase introduced by Dr. Harry Stopes-Roe, which has had staying power). *Objective, Fair and Balanced* (1975) was a key pamphlet in developing the idea of acceptable RE, and in 2004, partly as a result of BHA lobbying, the government agreed that the national framework for RE should include humanism. Gaining recognition for humanism as a valid life stance has been a constant theme, and since Britain's 1998 Human Rights Act came into force, the BHA has campaigned for rights in law for humanism as a nonreligious belief equal to those given to religions.

Social concerns have persisted in the BHA's programming—the Social Morality Council, which brought together believers and unbelievers, was concerned with a moral outlook in society and moral education. The BHA has been active in arguing for voluntary euthanasia and the right to obtain an abortion. It has always sought an open society—the term popularized by Sir Karl POPPER—in which people of fundamentally different views cooperate in shared and neutral institutions for the common good. The Humanist Housing Association attempted to provide accommodation for needy, elderly humanists; the Agnostics Adoption Society worked to gain adoption rights for the nonreligious; the Humanist Counselling Group pioneered in nondirective counseling; Humanist Holidays organized vacations for humanists; while the World Order Group seemed to face an impossible task. Barbara Wootton criticised the BHA for aims which were too vague and unrealistic. Distinguished Advisory Council Members have included E. M. FORSTER, Harold Pinter, Julian Huxley, A. S. Neil, Karl Popper, Vanessa Redgrave, Richard Dawkins, and Bernard Crick.

A survey of members in 1971 indicated that members were largely middle class, male, elderly, left wing, and passionately concerned with social problems. The sociologist and active humanist Dr. Colin Campbell considers that humanism cannot be just antireligious but must be predicated on "the value of rationality, individual responsibility, and human-self-sufficiency." Today the BHA persists with its activity, especially in education, philosophical research, local groups, a network of nonreligious officiants, and a regular newsletter. It is the largest membership organization in the British humanist movement, with more than four thousand members. Although it has financial problems, it appears set to continue its work throughout the twenty-first century.

JIM HERRICK

BROWN, ETHELRED EGBERT (1875–1956), African American Unitarian leader. Ethelred Brown was born on July 11, 1875, in Falmouth, Jamaica, the oldest of James and Florence Brown's five children. He entered the Jamaican civil service after taking the exam in 1894. Five years later he became the first clerk of the treasury and he remained in that post until 1907, when he was dismissed under questionable circumstances in connection with an allegation of missing funds. After leaving the civil service, he accepted his call to ministry. During his youth, Brown had many doubts theologically and found himself greatly attracted to Unitarianism after reading the writings of notable Unitarians including William Ellery Channing (see UNITARIANISM TO 1961). Despite his growing interest, no Unitarian fellowship for blacks existed in his native Jamaica, severely limiting his theological options. Brown could have sought ordination in the African Methodist Episcopal (AME) Church, of which he had been an active member and sometime organist, but he felt compelled to develop his faith along Unitarian lines.

Brown wrote a letter expressing his interest in becoming a Unitarian minister, which reached Franklin Southworth, president of the Meadville Theological School. Southworth replied discouragingly, noting that white churches needed white ministers and there were no prospects for organizing a black or interracial Unitarian church. Despite such dissuasion, and despite the considerable hardships borne by his wife, Ella, and their six children, Brown eventually received his theological preparation at Meadville Theological School as a special two-year student to the seminary. On June 4, 1912, he was ordained to the ministry of the Meadville Unitarian Church. Due to immigration problems, Brown was deported back to Jamaica. Upon returning to his homeland, he became a Unitarian missionary and formed a Unitarian Lay Center in Montego Bay; this lasted for nearly three years with meager support from the American Unitarian Association (AUA) as well as the British

and Foreign Unitarian Association (B&FUA). Brown subsequently served as a minister of the Unitarian Church in the city of Kingston for six years at the behest of the AUA. Financial support for Brown's ministry was abruptly cut by the two associations based on a critical report by the Unitarian minister Hilary Bygrave. In an effort to restore his funding, Brown pleaded his case directly with Samuel Eliot, president of the AUA. Though he felt that Eliot was condescending toward black people, Brown refused to believe that the AUA was antagonistic toward him or his ministerial efforts. Although the AUA briefly provided more funding, the leadership of the denomination was halfhearted about Brown's prospects of organizing a Unitarian church among black congregants and finally withdrew its support by 1917.

In February 1920 Brown left Jamaica with his wife and family to seek greater opportunity in New York City. Along with several other Afro-Caribbean immigrants, he founded the Harlem Community Church, which by the end of the decade had been renamed the Harlem Unitarian Church despite the fact that it had received virtually no backing from the AUA. Lacking significant financial support for nearly twenty years, Brown held a wide variety of jobs including elevator operator in order to provide for his family. For several decades, his relations with the denomination were strained, until in 1937 the Harlem Unitarian Church was officially recognized as an AUA congregation. This change in status also made it possible for Brown to receive a pastoral support and a pension for his years of ministerial service.

For more than twenty years, Brown was an active member of the Socialist Party, which employed him as an organizer and speaker. He was also chairman of the Board of the Jamaica Benevolent Association and president of the Jamaica Progressive League, a political society that secured a new constitution for Jamaica in 1944. One of the great fights of his life was the battle to make the promise of racial equality in America and worldwide a reality, but this struggle took a great toll on him and his family; his wife became mentally ill after suffering a nervous breakdown and a son committed suicide. Brown remained as the pastor of the church he had helped to found until his death on February 17, 1956.

JUAN FLOYD-THOMAS

BROWN, GEORGE (1858–1915), English cobbler, anarchist, and atheist. Born April 16, 1858, at Raunds, England, the son of a freethinking shoemaker, George Brown began as a public speaker by stumping for Charles BRADLAUGH, then campaigning for Parliament. Brown's education was limited almost entirely to debates in gatherings of the NATIONAL SECULAR SOCIETY and labor unions. Around 1881 he began a five-year stint in India, where native noncooperation with capitalism at a boot factory further radicalized him. Arriving in Chicago in early 1886, Brown was present at the Haymarket police riot, and following that case he converted to philosophical (nonviolent) anarchism (see ANARCHISM AND UNBELIEF). He settled in Philadelphia around 1891, where he made a free-love union with the anarchist poet Mary Hansen that lasted twenty-four years (see SEX RADICALISM AND UNBELIEF). Both were leading members of the city's anarchist-liberal clubs, and the couple was always quite poor. Brown lectured on labor activism, modern literature, and the morality of free-love, mostly in Philadelphia. From 1899 he contributed essays to anarchist and socialist journals. In 1910 he cofounded the city's Ferrer Modern School (see FERRER, FRANCISCO).

From 1908 the Browns spent their summers at the Single Tax colony at Arden, Delaware, and in 1911 an ongoing feud there escalated into a national news item. Brown's rivals, loyal to the colony's affluent trustees, had the shoemaker arrested for disturbing the peace after he repeatedly raised local issues at club meetings. He spent four days in jail, then retaliated by swearing out warrants against eleven neighbors, including Upton SINCLAIR, for violating the blue laws by playing ball on Sunday. The trial at Wilmington, Delaware, on August 1 gave Brown the platform of his lifetime. The crowd went wild as he calmly testified, reversing every word he had been shouting from rostra and street corners all his life, in order to demonstrate the absurdity of law.

"I want the Sabbath day to be one of peace," Brown said. "[I]t is a day when the workman . . . should have his peace and quiet . . . the slang used on the ball field shocks me." He said that while breaking rocks at the jail, he "came to see a great light; that the Law is supreme and must be obeyed." The result was an eighteen-hour sentence in the same jail for ten men, which brought on a public campaign for prison reform by Sinclair, to say nothing of embarrassing public exposure of the colony's internal disputes and gossip.

Summoned for jury duty the following year in Philadelphia, Brown asked to be excused, telling the judge, "I do not believe in Religion or Law. If there were no law there would be no poverty, and if there were no poverty there would be no crime, and we would need no courts." The judge ruled that Brown was not excused but unfit to be a juror, and regretted having no excuse to commit him to an asylum. Brown died from blood poisoning on February 14, 1915, the result of a splinter in his hand received three months earlier.

ROBERT P. HELMS

BRUNO, GIORDANO FILIPPO (1548–1600), Italian philosopher and Inquisition victim. Giordano Bruno was born in the town of Nola, located near Naples, Italy. He was an outspoken youth and eventually became an outspoken Dominican monk. During his tenure as a Dominican, it was suggested that he had read some of the "forbidden works" of Desiderius ERASMUS. This, along with his unorthodox views of Christianity, prompted the Catholic Church to issue an indictment of HERESY against Bruno in 1578. On learning the indictment was imminent, Bruno fled to France, beginning a life as an intellectual nomad.

It was not uncommon for intellectuals to wander from university center to university center, but it was uncommon for them to be forced to move. Bruno's outspoken critiques and attacks upon orthodox views made him welcome at these university centers only for a short time. He began his wanderings by going to Geneva, followed in turn by France, England, France again, Germany, and then Venice.

Bruno returned to Italy in 1591 and stayed in Venice, at the insistence of Giovanni Moncenigo, in order to teach some of his "natural magic of memory training." Bruno also could have been homesick, or trying to reach the Vatican in order to win the pope's support for some of his controversial ideas. Nonetheless, Moncenigo turned him over to the Venetian Inquisition. Bruno was held for more than a year in Venice; Roman authorities insisted that he be turned over to them, which he was in February 1593. Bruno was imprisoned for more than six years without writing materials and without any explanation for the delay in his trial. In January 1600 he was handed over to the Grand Inquisitor, convicted, and turned over to the secular authorities to carry out the Inquisition's sentence. The decree was that Bruno be burned at the stake by the governor of Rome (the Inquisition commonly handed over its victims to the secular authorities to dispatch). On February 17, 1600, Bruno was led to Campo de Fiori, where he was burned at the stake before the crowds visiting Rome for the Jubilee Year.

Bruno and his works were largely ignored until eighteenth-century deists (see DEISM) started reading his works and making him their champion. In the nineteenth century, Italy's freethinkers also adopted Bruno as a martyr to the cause of FREETHOUGHT. A statue of Bruno was placed at the spot of his death and dedicated on June 9, 1889. On every February 17 thereafter, freethinkers have gathered in Campo de Fiori to celebrate Bruno's life.

There are no clear indications as to the exact reason for Bruno's execution. Some scholars have attributed it to his knowledge of magic and Hermetic philosophy; others have attributed it to his belief in the Copernican system. In *The Catholic Encyclopedia*, it is stated that it was for his errors in theology, which included the idea that Christ was a master magician and that he believed transubstantiation to be impossible. After hearing the judgment of the Inquisition, Bruno is quoted as saying, "Perchance your fear in passing judgment on me is greater than mine in receiving it."

TIMOTHY BINGA

BÜCHNER, GEORG (1813–1837), German writer, social revolutionary, and physician.

Life. Born in 1831 in Goddenau near Darmstadt as the son of a physician, Georg Büchner studied medicine in Strassburg, Giessen, and Zürich. In 1833 he cofounded a section of the *Gesellschaft der Menschenrechte* (Society for Human Rights) in Giessen. This secret oppositional group espoused an egalitarian, early communist position.

In 1834 Büchner moved to Darmstadt, where he wrote and distributed rabble-rousing pamphlets. Denounced, he fled to Strassburg in 1835. He died at Zürich at the age of twenty-three, shortly after completing his PhD. Georg Büchner was the brother of philosopher and physician Ludwig BÜCHNER.

Major Works. In his time, Büchner was among the lesser-known authors. Only since the early twentieth century he has been acknowledged as a forerunner of NATURALISM and expressionism. His first play, *Danton's Death* (*Dantons Tod*), written in 1835, presents the French Revolution's key figures as resigned men, disillusioned after their attempt to change the course of his-

tory. Erroneously equating the characters' position with the author's, philologists used to interpret the text as antirevolutionary and nihilistic; today its revolutionary appeal is undisputed.

An overtly social revolutionary publication was the pamphlet "Hessian Courier" (*Hessischer Landbote*), written by Büchner and Friedrich Ludwig Weidig to oppose the staggering tax burden borne by peasants and artisans to subsidize the grand duke's inflated administrative machinery. Published anonymously, it marked the peak of journalism in the *Vormärz*, the years between the German war of independence (1813–1915) and the 1848 revolution.

In his novella *Lenz* (1839), Büchner criticized Christianity for discouraging reform in this life by offering the consolations of the hereafter. The work was based on the life and descent into madness of writer Jakob Michael Reinhold Lenz, who suffered from schizophrenia. Büchner's source was a report by the priest, social reformer, and educator Johann Friedrich Oberlin, with whom Lenz spent some time in a Vosges village. Unlike Oberlin, Büchner does not blame Lenz's illness on his "immoral lifestyle," but merely describes it as a feeling of overwhelming isolation.

Büchner's fragmentary play *Woyzeck* is considered the beginning of German social drama and has meanwhile become one of the most widely read and performed nineteenth-century German plays.

INGE HÜSGEN

BÜCHNER, LUDWIG (1824–1899), German physician and philosopher. Together with Carl Vogt and Jacob Moleschott, Ludwig Büchner continued in Germany the development of French eighteenth-century materialism. Büchner, Vogt, and Moleschott advocated what may be called physicalistic materialism (see PHYSICALISM), quite distinct from the social and political ATHEISM and MATERIALISM of Karl MARX, Friedrich Engels, and Vladimir Ilyich Lenin.

Büchner, Moleschott, and Vogt were mainly influenced by developments in chemistry, physiology, and zoology. Their materialism represented an extrapolation of scientific results to a philosophical level. This was particularly the case with Büchner, who in 1855 published his sensational *Kraft und Stoff* (Force and Matter). The title of this book was taken from a chapter of a book which Moleschott, originally from Holland, had published in 1852.

Büchner's *Kraft und Stoff* has sometimes been compared to a similar book of French materialism, Paul Heinrich Dietrich d'HOLBACH's *Système de la nature* (*System of Nature*, 1770), sometimes called "the Bible of French materialism." But as a philosopher, Holbach was more accomplished and wide ranging than Büchner.

In *Kraft und Stoff*, Büchner attempted to compensate for his limited philosophical knowledge by spewing derogatory remarks about philosophers. Büchner later acquired a deeper understanding of philosophical problems, but he never reached the same level as Holbach. In fact, Holbach may well be ranked with the great philosophers of the past, whereas Büchner was less important. Still, as a philosopher Büchner has often been underrated.

Büchner was not only active as a physician and a theorist. Together with eleven other intellectuals, Büchner played an active role in founding the World Union of Freethinkers in 1880. He was also instrumental in founding the German Freethinker Association (Deutscher Freidenkerbund) in 1881.

FINNGEIR HIORTH

BUDDHISM, UNBELIEF WITHIN. What Is Buddhism? Buddhism is a religion, a philosophy, and a body of practices that originated in India in the fifth century BCE. Its founder is ordinarily said to be Siddhartha Gautama, often believed to have lived between 563 and 483 BCE. An alternative date of death based on Chinese sources is 368 BCE. Sources agree that Gautama died at eighty years old. He is traditionally called the Buddha, the "enlightened one." Buddhism teaches salvation through escape from samsara, an endless cycle of birth and

rebirth that Buddhists ordinarily take for granted.

In Hindu and Buddhist belief, samsara is a bondage of life, death, and rebirth dictated by karma. Karma is a universal law of cause and effect as applied to the deeds of people. A deliberate good or bad deed leads a person's destiny in the appropriate direction. The ripening of the deed may take more than one lifetime, tying the agent to the cycle of rebirth as dictated by samsara. Only deeds free from desire and delusion are without consequences for karma.

Buddhists ordinarily say that there are Four Noble Truths, the four great truths of Buddhism. The first says that all existence is afflicted with suffering. The second truth identifies desire, thirst, or craving as the source of suffering that binds beings to samsara, the cycle of existence. The third truth asserts that through the elimination of craving, suffering can be brought to an end. The fourth truth identifies an eightfold path as the means to eliminate suffering and escape from samsara.

The eightfold path, the last of the four noble truths of Buddhism, is the key to release from suffering. Its elements are: (1) The right or perfect view of the four noble truths and of the nature of the self (atman). (2) Perfect resolution in favor of renunciation and ahimsa, or nonviolence. Ahimsa is an ethical principle forbidding injury to all living creatures, implying vegetarianism and pacificism. (3) Perfect speech, that is, avoidance of lying and slander. (4) Perfect conduct. (5) Perfect livelihood, including avoidance of harmful professions. (6) Perfect effort. (7) Perfect mindfulness or control of thought. (8) Perfect concentration, or attainment of the contemplative ideal.

The eightfold path is not intended to be followed in a linear way, but gives the different elements needed to live a life that leads to release from suffering.

The first step in the eightfold path states the need to have the right view of the nature of the self or atman. In Hindu thought atman is believed to be an eternal soul, at death transmigrating to another body, not necessarily human. Buddhism denies the existence of atman as an eternal soul. It subscribes to the doctrine of *anatman* (*anatta*), the view that there is no permanent soul. There is no ongoing owner of the fleeting perceptions and experiences that make up our lives.

The doctrine of *anatman* has often been praised as a precursor of the so-called bundle theory of the mind or self, a theory advocated by the Scottish philosopher David HUME. According to the bundle theory, we have no reason to think in terms of a single unified self that owns a variety of experiences or states. We only have access to the succession of experiences. The enduring self is a fiction of the imagination. This sounds very much like the doctrine of *anatman* found in Buddhism. But in Buddhism it is combined with a doctrine of karma and rebirths, which is not the case in Hume's thought.

The cycle of births and rebirths is not necessarily unending. By accepting the four noble truths and practicing the eightfold path, it is possible to escape from the cycle of births and rebirths and reach nirvana. Nirvana is posited as the final and total release from cyclic existence, without further rebirths and their attendant miseries. Nirvana is, in Buddhist thinking, ordinarily conceived as the complete extinction of individuality, but without total loss of consciousness. It is invariably described as a condition in which all pain, suffering, mental anguish, and above all, samsara, have ceased. Whereas an atheist (see ATHEISM) ordinarily believes that with death all consciousness, all pain, and all happiness end, Buddhists tend to believe that all *painful* kinds of consciousness disappear, but that there still is room for some bliss or happiness, perhaps even a form of bliss that is impossible in samsara.

Critique of Buddhism. We have so far given an account of the more basic aspects of Buddhism. We have mentioned speculative beliefs in karma, in samsara with its "unending" cycle of births and rebirths, and in nirvana. Buddhism in fact contains an immense amount of speculation. But Buddhism does not postulate an almighty God who created everything. In this way, Buddhism may remind one of modern atheism. But taken as a whole, Buddhism is quite remote from most forms of modern atheism.

The early Buddhists accepted the views of the universe generally held in India at that time. These views implied that the universe is not created out of nothing at a particular time, nor will it be completely destroyed at another time. The universe has always existed and will always exist.

This sounds like a modern kind of cosmology, albeit one without a Big Bang. It is therefore sometimes supposed that Buddhism is compatible with modern atheism or that it is an atheistic religion. This does not hold for traditional Buddhism, which takes polytheism for granted. A modern Buddhist can reject the existence of gods, but in doing so he or she deviates from traditional Buddhism.

Traditional Buddhism has a mythology with six realms or destinations in which it is possible for rebirth to take place: (1) the heavens, that is, the realms of gods and other "higher" beings, plus some rarefied regions above them; (2) the realm of the *asuras* or titans, that is, bellicose gods; (3) the realm of humans; (4) the realm of animals; (5) the realm of hungry ghosts; and (6) the hell realms, which in Buddhist writings are numerous and exceedingly painful.

Siddhartha Gautama himself left no writings. His beliefs were orally transmitted for about four hundred years before being written down. Serious quarrels arose among the successive generations of adepts. Many schools of Buddhism arose. Of these Theravada, Mahayana, and Tantrayana survive and are divided into many sects and groups. They all appeal to the Buddha as their authority. But strictly speaking, nothing is known as to what the Buddha himself believed.

As a whole there is not much unbelief *within* Buddhism.

Buddhism, like theistic religions and philosophies, is highly speculative. An atheist may feel at home in Buddhism, and there almost certainly are many atheists among the Buddhists. But so are there many atheists among nominal Christians, Muslims, and Hindus. Buddhism as whole is hardly more atheistic than the theistic religions.

FINNGEIR HIORTH

BUFFON, GEORGES-LOUIS LECLERC, COMTE DE (1707–1788), French naturalist and freethinker. Georges-Louis Leclerc was born to a wealth family in Montbard, France, on September 7, 1707. His father, Benjamin, wanted his son to study law, which he did until 1727, when his interest in mathematics became strong. Georges-Louis studied mathematics as well as botany at Angers University until he was forced to leave as a result of a duel in 1730. Buffon (as he began calling himself) studied in other places at this time, including Italy, until he inherited his mother's estate and became an important gentleman. As a result of his background in botany and mathematics, he was asked to improve shipbuilding for the French navy by testing the mechanical properties of wood. This eventually led to his appointment to the Jardin du Roi (which later became the Jardin des Plantes) as a member of the French Academy of Sciences. In this position, he began his *Histoire naturelle, générale et particulière* in 1749.

Histoire naturelle, an epic work written to unify the sciences of natural history, geology, anthropology, and botany, was originally conceived to be a fifty-volume work, but Buffon died in 1788 after only thirty-six volumes (eight were published posthumously). These volumes are thought to have provided influences upon the thought of Charles DARWIN, Alfred Russel WALLACE, and Lamarck, concerning the evolution of species. Buffon proposed no "mechanism" for evolution, but he pointed out generally that man and ape may have descended from a similar ancestor, as well as the idea that animals and plants both undergo "modifications" over time that produce different varieties, and these changes can be seen if one studies nature.

The environment in France at the time when the first several volumes of *Histoire naturelle* were published became problematic for Buffon. Buffon was a man of means, and as such, was supposed to hold to orthodox thought on the state religion. The Sorbonne (at that time, the Faculty of Theology, Paris) condemned parts of his work, especially those presenting Buffon's least orthodox proposals. The Sorbonne was in a difficult way itself; *Histoire naturelle* was an official publication of the crown and it could not publicly oppose a work of the King. Buffon was censured, but in the following volume of *Histoire naturelle*, he published all the correspondence that had occurred over this incident as a way to appease the Sorbonne. This included letters that Buffon had written affirming his belief in the official state religion, particularly creation as it was written in the Bible. It is believed that Buffon only wrote this to appease the religious regime of France at that time. In later correspondence Buffon seems to retract these letters; thereafter his writings were crafted with particular care so as not to create controversy.

Despite his being a friend of Denis DIDEROT, Buffon was not included in *L'Encyclopédie* (see *ENCYCLOPÉDIE L'*, AND UNBELIEF), other than seeing proofs from time to time. *L'Encyclopédie* was written during the same time Buffon was writing his *Histoire naturelle*, and the two works display many similar passages within their texts. *L'Encyclopédie* attracted close official scrutiny for its heterodoxy; it is likely that Buffon escaped much of the controversy that might have embroiled him if *L'Encyclopédie* was not keeping would-be censors so busy.

Buffon's writing style was unusually open and nontechnical, and his works had a significant impact in promoting interest in the natural sciences in France. His writings were another stepping-stone that eventually led to the theory of evolution as we know it today (see EVOLUTION AND UNBELIEF).

TIMOTHY BINGA

BULLOUGH, BONNIE (1927–1996), American humanist writer. Bonnie Bullough became a humanist (see HUMANISM) in her teens. She was a laureate of the International Academy of Humanism; a contributing editor of the secular humanist magazine *Free Inquiry*; and author,

coauthor, or editor of more than thirty books, a hundred or so refereed articles in scholarly journals, and an equal number in popular journals.

Bonnie never knew her father, and although she was named Louise Larsen at birth, she soon came to be called Bonnie; when her mother remarried she became Bonnie Dempsey. In her early teens she was adopted by a bachelor uncle after her mother abandoned the family. Thus her full name was Bonnie Louise Larsen Dempsey Uckerman. When she married, Bullough became the surname she preferred. She might be called a survivor who blossomed as an adult. Badly burned at age four, she spent most of her childhood summers in the hospital undergoing plastic surgery, and still retained some scars as an adult. She entered nursing through the Cadet Corps during World War II and graduated from the University of Utah. She later went on to get a master's degree in nursing, as well as master's and doctorate degrees in sociology from UCLA.

She was one of the pioneers in the nurse practitioner movement, helping to launch and serving on the editorial staff of several nurse practitioner journals. She was on the faculty at UCLA and at California State University, Long Beach, before becoming dean of nursing of the State University of New York at Buffalo, where she became a full professor. After retiring from Buffalo in 1993, she became a professor at the University of Southern California, a position she held until her death.

She lectured and traveled all over the world, making many presentations to humanist groups, including lectures in Egypt, Ghana, the USSR, China, Greece, Croatia, and Australia. Many of her other presentations were to nursing groups, which she addressed in almost every state in the United States. She was a member of the American Academy of Nursing.

Much of her research in her later years was devoted to sex and gender issues, as were many of her publications. She and her husband, Vern Bullough, received the Kinsey Award for their research and publications in the field. She was the mother of five children, three of them adopted. Her eldest son was murdered while in his early teens during a visit to Palestine. She had one granddaughter.

VERN L. BULLOUGH

BUTLER, SAMUEL (1835–1902), English satiric novelist. Though Samuel Butler was the son of a country vicar and grandson of an influential bishop, he became hostile to orthodox Christianity, especially as practiced in the Anglican Church. In the preface to his *Erewhon Revisited* he described himself as "the broadest of broad churchmen." In nineteenth-century parlance a broad churchman was one who believed very little of the Christian story and metaphysics, but saw the church as an instrument of good works and social control. In his *Notebooks* he referred to "The Scylla of Atheism and the Charybdis of Christianity." This suggests that he was some sort of noncommittal theist or perhaps an agnostic. Butler had an unhappy boyhood with a hypocritical and unpleasant father, but at St. John's College, Cambridge, he was happy and successful. He declined to take holy orders and for a time took up sheep farming in New Zealand, whose topography suggested the fictional setting of his *Erewhon* ("Nowhere" backwards). In Erewhon, ill people are treated with contempt and criminals are treated with great sympathy. Criminals go to "straighteners" who give them pain and unpleasant prescriptions, much as surgeons and physicians do to us, in a neat satire of our penal systems. In Erewhon machinery is banned because of fear that it would evolve to enslave us, foreshadowing concerns some people hold today about computers. Higgs, the traveler to Erewhon, escapes in a balloon attended by storks. In *Erewhon Revisited*, Higgs's son goes to Erewhon to find that a religion of the Sunchild had grown up, because the older Higgs was said by the credulous to be the Sunchild and to have ascended to his father, the Sun, accompanied by angels. A more direct, but ironically stated, critique of the Christian resurrection story is given by Butler in his book *The Fair Haven*. Charles DARWIN admired this book, but in general disapproved of Butler on account of the latter's amateurish attacks on the theory of natural selection. This made Butler hostile to what he conceived of as dogmatic science no less than to dogmatic theology. Probably Butler's greatest book was his posthumously published *The Way of All Flesh*. This great novel in part reflects Butler's own upbringing and loss of faith. Butler was praised by George Bernard SHAW in the preface to *Back to Methuselah*, but for the wrong reason, Butler's Lamarckianism.

J. J. C. SMART

BYRON, GEORGE GORDON, LORD (1788–1824), British poet, once the most celebrated literary figure in Europe. Handsome and charismatic, George Gordon, Lord Byron, was the darling of polite society, the cynosure of salons, a pacesetter in fashion and manners, the observed of all observers. Smitten debutantes, madams, and maidservants vied for the attention of the dashing peer of the realm. Men envied him. *Childe Harold's Pilgrimage*, published when the poet was twenty-four, captivated the romantic imagination of a continent. "I awoke one day," said Byron, "and found myself famous." Despite his demurrals, readers fused him with Childe Harold—a brooding, enigmatic pariah haunted by a dark past and nameless guilt.

Byron was an amalgam of disparate traits: cruelty and kindness, misanthropy and philanthropy, cynicism and idealism, affectation and sincerity, arrogance and self-mockery, pettiness and magnanimity, intemperance and asceticism, self-pity and courage. On balance, the virtues trumped the vices. Despite sporadic vulgarities, tawdry liaisons, and a studied flippancy, Byron was a loyal friend and a bold leader.

Influence of Calvinism. Byron could never quite shake off an early indoctrination in Calvinism. Harangued by a pious, domineering mother and catechized by a string of Presbyterian tutors and scripture-quoting nurses, young Byron perversely deduced that he was irremediably damned. A clubfoot (his mark of Cain), the mockery of playmates, and the early loss of his father confirmed his perceived reprobate status. Possessing a Puritan conception of wickedness, Byron was susceptible to bouts of Olympian debauchery, oscillating between "ungodly glee" and remorse.

His sense of unmerited reprobation led him to identify with Lucifer and Cain: "Souls who dare look the Omnipotent tyrant in / His everlasting face, and tell Him that / His evil is not good." In *Cain*, a closet drama on the theme of the Fall, the scofflaws collaborate on an indictment of the Almighty. Jehovah, Lucifer tells Cain, wanted humans to live as benighted beasts in "A Paradise of Ignorance, from which / Knowledge is barred as poison."

Critic of Christian Doctrine. In letters to friends, Byron could sound the note of an Enlightenment rationalist (see ENLIGHTENMENT, THE, AND UNBELIEF; RATIONALISM). "In morality," he said, "I prefer Confucius [see CONFUCIANISM] to the Ten Commandments and SOCRATES to St. Paul." He disdained revelation and mystery: "God would have made his Will known without books," he told his lifelong friend Francis Hodgson, a cleric, "considering how very few could read when Jesus of Nazareth lived, had it been His pleasure to ratify any peculiar mode of worship."

On miracles, he sided with the skeptics: "I agree with HUME that it is more probable men should lie or be deceived than that things out of the course of nature should so happen." Resurrection was illogical: "If people are to live, why die? And are our carcasses worth raising? I hope, if mine is, I shall have a better pair of legs than I have moved on these two-and-twenty years, or I shall be sadly behind in the squeeze into Paradise." Like eternal punishment, eternal bliss was unjust: "All the pious deeds performed on Earth can never entitle a man to everlasting happiness." The Christian scheme of salvation was superfluous: "Christ came to save men, but a good Pagan will go to heaven and a bad Nazarene to hell. If mankind who never heard or dreamt of Galilee and its prophet may be saved, Christianity is of no avail. And who will believe God will damn men for not knowing what they were never taught."

Byron anticipated Sigmund FREUD's "moral fallacy" of Christianity: "The basis of your religion," he wrote to Hodgson, "is injustice. The Son of God, the pure, the immaculate, the innocent, is sacrificed for the guilty. This proves His heroism; but no more does away with man's guilt than a schoolboy's volunteering to be flogged for another would exculpate the dunce from negligence or preserve him from the rod." Byron thought religions were best judged by the moral character of their adherents. On that score, Christianity did not impress him: "Talk of Galileeism? Show me the effects—are you better, wiser, kinder by your precepts? I will bring you ten Mussulmans shall shame you in all good will towards men and duty to their neighbors."

Uneasy Agnostic. While a student at Cambridge, Byron had read enough of Hume and the Voltairian skeptics (see VOLTAIRE) to unsettle his faith in Christian dogma, both Catholic and Protestant, but he was never secure in his apostasy. Percy Bysshe SHELLEY, his atheistic neighbor and fellow exile in Switzerland, bemoaned his inability to unfetter Byron from the delusions of Christianity and rid himself forever of the specter of Calvinism. Apparently, Byron went to his grave in a state of incertitude.

CALDERONE, MARY STEICHEN (1894–1998), American humanist and sex educator. The daughter of well-known photographer Edward Steichen, Mary Calderone made her reputation as a sex educator and counselor. A graduate of the medical school at the University of Rochester, she was married to another physician, Frank Calderone. The two separated in 1979 but never divorced. A nominal Quaker, she was much honored in humanist circles, and was named Humanist of the Year in 1974 by the AMERICAN HUMANIST ASSOCIATION.

She entered the sex field as a professional when she was appointed medical director of the Planned Parenthood Federation of America in 1953. As director she tried to take the federation into the field of sex education, believing that as a result of the research of Alfred Kinsey and others, there was a need for large-scale public education about sex. Her efforts at Planned Parenthood were opposed by Alan F. Guttmacher, who headed up research for Planned Parenthood and who believed that any public education program would weaken the organization. Contraceptive planning itself, he held, was controversial enough without the organization taking on further causes.

Discouraged, she and Lester KIRKENDALL, a humanist and longtime family life educator, joined to form SIECUS (Sex Information and Education Council of the United States) in 1964. Resigning from Planned Parenthood, Calderone became executive director of the new organization. Under her leadership SIECUS developed a public health approach to sex, focusing on awareness and education. It soon assumed a leading role in introducing sex education into the schools. She and the organization quickly became a target of virulent attacks from opponents of sex education such as the John Birch Society and the Christian Crusade; among other things, she was accused of being a tool of the Communist Party. Calderone became president of SIECUS in 1975; in 1980 she received the Margaret SANGER Award from Planned Parenthood, marking a change of attitude in that organization.

Calderone was a very effective public speaker. One of her favorite questions to young audiences was to ask for a four-letter word ending in *k* that among other things meant sexual intercourse. When they tittered, she answer the word was *talk*, emphasizing that human sexuality went far beyond the sex act but rather was a multifaceted aspect of life that should not be hidden in a shroud of secrecy or lowered only to the level of erotic expression. Among her books are *Talking with Your Child about Sex* (1982) and *The Family Book about Sexuality* (1987).

She received honorary doctorates from twelve institutions, and had numerous awards from groups such as the American Public Health Association, the Society for the Scientific Study of Sex, and the Scheslinger Library. She was the mother of three daughters, a grandmother of three, and a great-grandmother of three. She was named by various publications as one of the fifty most influential women in America, in another as one of the seventy-five most important women, and in the *World Almanac* she was listed as among the two hundred most influential people in the world.

VERN L. BULLOUGH

CAMUS, ALBERT (1913–1960), French novelist and existentialist. Albert Camus surged upon literary Paris in 1942 with the novel of his generation, *The Stranger.* He had first to open the door to the *absurd*, so he could pass beyond it to the concept of *revolt* and, ultimately, to the *seeking of the moral act*. Camus wove these themes into a philosophy of life (see EXISTENTIALISM) that later would inform his novels, plays, and essays, and his commitment to social activism.

World of Silence. Born in Algeria, he was raised by his grandmother; his mother, whom he adored, but who rarely spoke or made a gesture of affection; and his uncle, who was partially mute. His father was killed in World War I when Camus was an infant. The family lived in a world of silence. He would later confront the duality within himself (as he writes in *The First Man*, posthumously published in 1995), the split between his love for the land of the unknown—the heat, the sun—and the man he became, an author who won fame, a luminary in Parisian intellectual circles. The young boy's intelligence and fervor, his hunger for knowledge, created a chasm within him, making him ever an outsider. He espoused views, often controversial, in defense of his native Algerians. Camus was tragically killed in a car crash in 1960.

The Absurd. To challenge the NIHILISM of his age, Camus developed the concept of the absurd, which he defines in *The Myth of Sisyphus* as the encounter between the human being's innate need for order and purpose and the blank indifference of the universe. To live in such a world and to salvage meaning from it, he urges, one must live with the conviction that absurdity, in the sense of recognizing and accepting the fact that there are no metaphysically guaranteed directives for conduct, can generate a positive ethic. Only by this recognition, and this acceptance, insists Camus, and only by the conscious espousal of human purpose and action, can we transform nihilism from a passive despair into a way of *revolting against* and of transcending the world's indifference to the human being.

Revolt. Camus introduces his principle of *revolt* in his novel *The Plague*. Refusing the world for what it is does not mean that one gives up and flees it, but rather that one lives in it under different terms, under the concept of revolt. Once we discover finitude and uncertainty and the old certitudes and confidence and ease have passed away, although we may despair of such a world, Camus reassures, this does not mean that we despair of ourselves, or of the validity of our own demands and aspirations. Moving away from the nihilism of *The Stranger* toward the HUMANISM of his subsequent works, Camus is leaving a solitary world for one in which the individual is concerned with the problems of the human being living with other human beings, and the need for finding meaning in life. Still living in the world of the absurd, but having discovered that he is no longer alone, and that we are *all* in trouble, he can challenge the world, if not remake it. Camus thus initiates a philosophy of rebellion.

In the words of the Nobel Prize in Literature that he was awarded in 1957, "Albert Camus illuminated the problems of the human conscience in our time." Rejecting older views and absolute values led some to individualism, often carelessly attributed to the existentialists—an error that Camus (and Jean-Paul SARTRE) tried to refute. There is a standard of values intrinsic to the human condition, Camus responds.

As Humanist. In his last and most controversial novel, *The Fall*, Camus decries our moral ambivalences. He is making an appeal for humanism. Unlike most spokespersons of the twentieth century, once Camus subscribes to the human being's *aloneness*, he will not stop here: we need not struggle alone, we can seek out

what we share in common as a solidifying base between us. We cannot change the absurdity, Camus knows, but we can change the way we live in it; we can change how we live with one another. It was Camus's vision that by working together we can create new values, "a new humanism."

Camus is said to have possessed that rarest of gifts, moral authority. He was the hero of many, and the object of incessant controversy. He found solidarity with fellow exiles and with victims of persecution everywhere. He won the respect of contemporaries, and from the reading public, for the stands he took (yet often in dispute), and for his lyrical prose. Albert Camus is considered perhaps the most important moral voice in literature since Lev Nikolayevich TOLSTOY.

CANADA (ANGLOPHONE), UNBELIEF IN. Colonized primarily by the French and English during the seventeenth century, early Canada was dominated by the Roman Catholic and Protestant faiths. By the time of Confederation in 1867, however, economic and population growth was producing an expanding middle class. This expansion had considerable impact on the belief systems of Canadians. As technological innovation and material wealth increased, middle-class Canadians began to embrace the view that there is an essential goodness in humans and that progress is a desirable goal of human striving. This view differed significantly from the central Christian view of humanity, which holds that all are born in sin and that release from human suffering and toil comes only in a heavenly afterlife. This new, emerging perspective on human possibility emphasized education and moral training as keys to reforming society. Middle-class reformers of the mid-nineteenth century tended to view criminals, the poor, and the insane as people who might be treatable and possibly even curable. Model prisons, houses of industry, and asylums were established to provide treatment, rehabilitation, and work skills. Meanwhile, science was becoming increasingly popular in academia; by the 1860s most Canadian universities had science faculties. And many Canadians, like their neighbors to the south, very much appreciated the novelty and laborsaving practicality of technological inventions. Still maintaining close ties to Britain, Anglophone Canada's middle class was influenced to some degree by Charles DARWIN's publication of the *Origin of Species* in 1859 (see DARWINISM; RELIGION IN CONFLICT WITH SCIENCE). Although many universities had ties to churches, their dependence on sponsoring churches diminished as they became more and more secularized. The presence of news services can also be considered as a major contributing factor to the gradual secularization of Anglophone Canada. By 1866 the Atlantic cable had been successfully placed, connecting Canada with Europe. Information could now be received and disseminated in a matter of minutes rather than weeks. Although newspapers were largely sustained by political parties and religious denominations, the eventual use of advertisements gradually displaced such control.

Freethought in Canada. One of the first strong indications of FREETHOUGHT activity in Canada came when Charles WATTS and his wife, Kate Eunice WATTS, emigrated to Toronto from England in 1883. Watts was a special lecturer of England's NATIONAL SECULAR SOCIETY; in 1876 he had become editor, printer, and publisher of a prominent freethought paper, the London-based *NATIONAL REFORMER*. He would eventually produce works ranging from *The Freethinker's Text Book* by Charles BRADLAUGH and Annie BESANT to his own *Freethought: Its Rise, Progress and Triumph*. When Watts first visited Toronto in 1882 to lecture before the Toronto Secular Society, he was invited to take up residence there. He returned in 1883 and led the secularist movement in Canada (see SECULARISM). It should be noted that a group called Freethinkers of Canada already existed, and had held a successful convention in Toronto in September 1888. Yet in that same year, the Canadian government refused to charter Watts's Secular Thought Publishing Company. Notwithstanding, during his time in Canada Watts managed to produce his Canadian journal publication *Secular Thought*, which was circulated from 1888 until around 1909. Watts's wife accompanied him on his lecture tours, emerging as a freethought activist and writer in her own right. She wrote several pamphlets, including "The Education and Position of Women" and "Reasons for Not Accepting Christianity," and a book published in Toronto, *Christianity Defective and Unnecessary*.

Still, for various personal, socioeconomic, and political reasons, religious influence—specifically Catholic influence—over Canadian life would not decline until almost a century later. But then it would dwindle sharply. Such phenomena of the 1960s as the Second Vatican Council, the emerging human and women's rights movements, reform on abortion laws, and the advent of reliable birth control in the form of "the pill" (see SEXUAL VALUES, IMPACT OF UNBELIEF ON; BIRTH CONTROL AND UNBELIEF) contributed considerably to the secularization of Anglophone Canada.

It is not surprising, then, that most of the prominent

persons and organization that have contributed to the rise of unbelief in Anglophone Canada since the day of Charles and Kate Eunice Watts appear in the twentieth century. The rest of this article offers a descriptive list of these individuals and groups.

The Humanist Association of Canada (HAC; 1968–). Organized humanism in Canada began around the middle of the twentieth century. Dr. Ernest Poser, a member of Britain's RATIONALIST PRESS ASSOCIATION (RPA), emigrated to Canada in 1941. He married a freethinker, Dr. Maria Jutta Cahn, and in 1954 they moved to Montreal. Later that year, Dr. R. K. Mishra, a research physician at the University of Montreal, placed an advertisement in the *Montreal Star* inviting area members of the RPA to begin a humanist group. The three met and eventually founded the Humanist Fellowship of Montreal. This group had two official patrons: Lord Bertrand RUSSELL and Dr. Brock CHISHOLM, a Canadian psychiatrist and first director of the World Health Organization. Chisholm often addressed the fellowship on public occasions. In 1968 the Humanist Fellowship of Montreal, the Victoria (British Columbia) Humanist Association, and several smaller local or regional humanist organizations merged to form the Humanist Association of Canada. Membership rose, and by the early 1970s there were approximately 350 members. The organization would spawn the development of Humanist groups across Canada, including those in Ottawa, Toronto, Guelph, Kitchener-Waterloo, Cambridge, Windsor, Winnipeg, Calgary, Vancouver, and Victoria. In 1996 the HAC was granted permission by the government of Ontario to perform legally recognized marriages. Two of the HAC's most influential leaders were past president Dr. Henry Morgentaler and current president Dr. Robert Buckman (see below).

Henry Morgentaler (1923–). Dr. Henry Morgentaler is a medical doctor and longtime abortion activist from Montreal. Polish-born, Morgentaler survived the Holocaust and emigrated to Canada in 1950. He began practicing medicine in Montreal. On October 19, 1967, he provided public testimony before a government of Canada committee stating that any pregnant woman should have the right to a safe abortion. Recognizing that there were limited options for unwanted pregnancies in Canada, in 1969 Morgentaler gave up his family practice and began performing illegal abortions. By 1970 he was arrested in Quebec for performing an illegal medical act. By 1973 Morgentaler claimed to have performed five thousand illegal abortions and was again arrested. Although he was acquitted by a jury in the court case, the verdict was overturned by five judges on the Quebec Court of Appeal in 1974 and he was sent to prison. His lawyer appealed and Morgentaler was again acquitted. In 1983 Morgentaler was charged again in Ontario for procuring illegal miscarriages. Although he was acquitted by a jury, the verdict was reversed by the Ontario Court of Appeal and was then sent to the Supreme Court of Canada. Here, Morgentaler was acquitted once again, and the Canadian Supreme Court declared the law unconstitutional (*Morgentaler et al. v. Her Majesty The Queen* 1988 [1 S.C.R. 30]).The power and breadth of this ruling contributed greatly to the end of all statutory restrictions on abortion in Canada.

However, in 1992 Morgentaler's Harbord Street abortion clinic in Toronto was bombed. In December 1995 Morgentaler sent an open letter to Pope John Paul II, pleading with him to find a peaceful resolution to the hate propaganda and violence directed not only at himself and his clinics but other clinics throughout the world.

Currently, Dr. Morgentaler is attempting to open several abortion clinics in the Canadian Arctic. He served as the first president of the Humanist Association of Canada. And on June 16, 2005, the University of Western Ontario awarded him his first honorary Doctor of Laws degree, in the face of considerable protest.

Robert Buckman (1955–). Dr. Robert Buckman is a medical oncologist at the Toronto-Sunnybrook Regional Cancer Centre and associate professor in the Department of Medicine at the University of Toronto. He graduated as a physician from Cambridge University in 1972 and completed his training in medical oncology at the Royal Marsden Hospital in London. He emigrated to Toronto in 1985. He is also an author, television personality, documentarian, and communications expert who has written over a dozen books and has been featured in award-winning television documentaries. He also writes and presents a series of medical information videos with Monty Python's John Cleese. Dr. Buckman is currently the president of the Humanist Association of Canada. He has appeared on numerous television and radio programs worldwide promoting the secularist humanist cause. He recently hosted a national documentary titled *Without God*, which follows the theme of his book *Can We Be Good without God?*

Ontario Skeptics Society for Critical Inquiry. This society defines itself as being comprised of "diverse individuals who share a common interest in promoting the understanding and application of critical thinking skills and scientific methodology in the explanation of human experience—from the seemingly mundane to the alleged paranormal." The society is committed to the maintenance of five fundamental tenets: activism for critical inquiry, provision of information to interested individuals and organizations, communication in the form of a "watchdog" approach to misinformation, education of critical thinking skills at all levels of education by means of the media, and philosophical reflection regarding scientific methodologies and their relevance to specific components of understanding human nature.

Pierre Berton (1920–2004). Born in Whitehorse, Yukon Territory, Berton was one of Canada's most prolific and best-known authors. During an extremely distinguished career which included the authoring of fifty books, hundreds of daily columns for the *Toronto Star*, and televi-

sion shows like *Front Page Challenge*, Berton sparked controversy by openly expressing freethought views on everything from the nonexistence of God to racism, premarital sex, and the finer points of rolling a marijuana cigarette. Berton had also received more than thirty literary awards and twelve honorary degrees. In 1986 he was appointed as a companion of the Order of Canada.

Evelyn Martens (1932–). Evelyn Martens was born and raised in Alberta, Canada. In the early part of the 1990s, Evelyn became quite active in the Right to Die Society, which provides terminally ill patients with information allowing them to end their lives safely. In 2002 Evelyn Martens was charged with counseling and aiding former nun Monique Charest to commit suicide in British Columbia. She also faced charges related to the June 26, 2002, death of Vancouver schoolteacher Leyanne Burchell. Facing as much as fourteen years' imprisonment, Martens was eventually acquitted of both charges on grounds that Charest and Burchell had voluntarily taken their own lives. An Evelyn Martens Defence Fund was established and successfully raised money for her court costs. In June 2005 Martens was presented with the Humanist of the Year Award by the Humanist Association of Canada.

Jan Narveson (1936–). Jan Narveson was educated at the University of Chicago, spent a year at Oxford (1959–60) on a traveling fellowship, and earned a PhD at Harvard in 1961. He initially taught at the University of New Hampshire until he was recruited in 1963 to help start up the philosophy department at the University of Waterloo in Ontario, from which he retired in 2005. He has published dozens of articles in professional journals and has written several books. His main professional interests lie in moral and political philosophy, specifically dealing with notions of personal and social liberty. Narveson is an avowed atheist (see ATHEISM) and a fierce debater in professional and social circles. He was the second atheist invited to the World Religions Conference held annually in Waterloo. One of Narveson's most succinct critiques against the existence of God came during a debate in 1996 against prominent Christian apologist debater William Lane Craig at the University of Toronto in January 1996. In 1989 Narveson was elected to membership in the Royal Society of Canada.

Michael Persinger (1945–). Michael Persinger attended Carroll College (1963–64), and then graduated from the University of Wisconsin, Madison, in 1967 with a major in psychology. He then received an MA in physiological psychology from the University of Tennessee and his PhD from the University of Manitoba in 1971. Since 1971 he has been a professor at Laurentian University in Sudbury, Ontario. He has published more than two hundred technical articles in referred journals and has written six books. Much of Persinger's work as a neuroscientist focuses on the subtle interactions between the geophysical and meteorological environment and human behavior, especially the effects of magnetic fields on human behavior. This has led him to search for neurological explanations regarding illusory accounts of causal relationships—specifically, the psychology by which persons attribute causation to unseen forces. In his book *The Neuropsychological Base of God Beliefs* (1987), he described the use of complex electromagnetic fields to discern the patterns that will induce experiences (sensed presence) that people often attribute to various perceived intrusions ranging from aliens to gods. Persinger has devised a helmet that applies weak magnetic fields across the right and left brain hemispheres, specifically the temporal lobes, often triggering pseudomystical experiences in the wearer. Persinger believes that naturally occurring electromagnetic fields arising from geophysical activity may be the cause of some religious or mystical experiences (see COGNITIVE SCIENCE AND UNBELIEF; RELIGIOUS AND MYSTICAL EXPERIENCES).

Svend Robinson (1952–). A controversial figure in Canadian politics, Svend Robinson represented the progressive New Democratic Party in Burnaby, British Columbia, from the age of twenty-seven and remained undefeated in the next six elections. In 1983 he was temporarily stripped of his title as justice critic—minority-party commentator on the work of the Ministry of Justice—after he commented to a Vancouver TV show that he supported the establishment of red-light districts and houses of prostitution. In 1988, at the age of thirty-five, Robinson announced on national television that he was gay and pledged to push for expansions in gay rights. In so doing he became the first openly gay member of the House of Commons. In 1999 Alexa McDonough, leader of the NDP, relegated Robinson to the backbenches in the House of Commons after he presented a petition calling for the word *God* to be removed from the preamble of the Canadian Charter of Rights and Freedoms. In 2002 Robinson traveled to the Middle East and attempted unsuccessfully to visit with Palestinian leader Yasser Arafat at his compound in Ramallah. Robinson is quoted as saying upon his return that "[t]he Israeli government and the Israeli military are guilty of torture and murder." Robinson was also quite active in the dying with dignity movement and aided high-profile patient Sue Rodriguez in her battle to convince the Supreme Court of Canada to grant her the right to a doctor-assisted suicide. Robinson is currently employed by the British Columbia Government and Service Employees Union as both an arbitrator and an advocate.

Michael Ruse (1940–). Michael Ruse was born on June 21, 1940, in Birmingham, England. A philosopher of science and professor of philosophy and zoology, he taught at the University of Guelph for thirty-five years and is currently the Lucyle T. Werkmeister Professor of Philosophy at Florida State University. Ruse is a world-renowned author and champion of Darwinian evolutionary theory. With David Hull he developed the field now known as philosophy of biology. The author of

dozens of journal articles and more than twenty books, he is also the founder and editor of the journal *Biology and Philosophy*. In 1981 Ruse was a state witness in the appeal of a state law in Arkansas that mandated the teaching of so-called creation science in public schools (see CREATIONISM). The law was ruled unconstitutional. In the preface to the second edition of his book *Taking Darwin Seriously*, Ruse stated: "The fact that we are the contingent end-products of a natural process of evolution, rather than the special creation of a good god, in his own image, has to be just about the most profound thing we humans have discovered about ourselves."

CHRISTOPHER DICARLO

CANADA (FRANCOPHONE), UNBELIEF IN. The FREETHOUGHT tradition in Quebec started in 1776 with the arrival of Fleury Mesplet, Montreal's first printer, librarian, and publisher. He also founded two newspapers and an academy named for VOLTAIRE. Until his death in 1794, Mesplet promoted Enlightenment ideals of tolerance and freedom and even the more radical thinking of the American and French revolutions (see ENLIGHTENMENT, UNBELIEF DURING THE). He was twice imprisoned for his ideas. By the end of the eighteenth century, Montreal's intelligentsia were infused with the ideas of the encyclopedists, as is clearly seen, for example, in the reading notes and correspondence of lawyer and politician Joseph Papineau.

The prominent politician Louis-Joseph Papineau, Joseph's son, inherited his father's ideals. In 1844 he founded the Institut canadien, an establishment that advocated sovereignty for French Canada, universal suffrage, the separation of church and state, and legal reform. Its library contained works of the philosophes and contemporary authors like Victor Hugo.

The Clerical Environment. French Canadian freethought bears the stamp of the suffocating power exercised by the Roman Catholic Church in nineteenth-century Quebec, as well as the persistent struggles between a largely Catholic population and the province's English Protestant rulers. Montreal bishop Ignace Bourget doggedly opposed the Institut canadien, railing against the "evil books" it contained and threatening its members with excommunication. In 1858 Bourget, writing "on behalf of God," urged his flock not to read books not approved of by the church and actually forbade the purchase of any book not approved by his office. "We were permitted to have books," wrote the journalist Louis-Antoine Dessaulles—Papineau's nephew—"as long as we read only those consecrated to divine right . . . religious intolerance" and "coercive thinking." Bourget had as little use for "evil newspapers" as he had for the Institut. In a pastoral letter of May 1858 Bourget condemned what he termed the heretical, irreligious, immoral, impious, and liberal press, adding that freedom of opinion is but a misguided freedom that kills the soul.

When the typographer Joseph Guibord, a member of the Institut, died in 1869, Bourget denied him Christian burial. In 1875 an order from the privy council of London—enforced by a thousand British soldiers—finally secured Guibord's burial. Bourget responded by damning the grave. Journalist Arthur Buies wrote that Bishop Bourget "wanted absolute docility, the suppression of free opinion, and submission to ecclesiastic authority."

Bourget was not alone; as late as the turn of the twentieth century, the cleric Oblate Zacharie Lacasse stated in his brochure *Autour du drapeau de l'Église* (Around the Flag of the Church) that real freedom consisted in recognizing the church as one's sole authority in all things.

Educational Controversies. Controversies over public—that is, Protestant—schools proliferated between 1846 and 1867 in the context of recurrent peasant uprisings. On several occasions Catholic peasants burned schools. The government ordered municipalities to contribute financial support for opening new public schools, sparking sharp protests by the church. By 1867 the church had managed to seize effective control of public schools and ceased to oppose them. It could afford to, having purged the schools of any vestige of freedom of thought. In his *Lettre sur le Canada* of February 9, 1867, Buies lamented that "intolerance is sanctified . . . teachers are no longer free . . . they are all under the rod of the village priest who manages the school at his whim and whom one must obey to avoid persecution, criticism, and loss of employment." By 1875 the church was even able to have the Ministry of Public Instruction, the government body responsible for public schools, abolished. As late as 1945 Jean-Charles Harvey could write in *Le Jour* that "Québec is the only province where all instruction is under clerical monopoly." Its schools underperformed all others in

North America. (The Ministry of Public Instruction would not be reestablished until 1963.)

From 1867 forward the church banned Quebec newspapers wholesale: *La Lanterne*, *L'Indépendant*, and *Le Réveil*, edited by Arthur Buies; *Le Bien public*, edited by Louis-Olivier David; *La Sentinelle*, edited by Aristide Filiatrault; *L'Électeur*, edited by Wilfrid Laurier; *La Semaine*, edited by Gustave Comte; *L'Action* and *L'Ordre*, edited by Olivar Asselin; *Le Pays*, edited by Godfroy Langlois; and *Le Jour*, edited by Harvey.

In 1902 the Ligue de l'enseignement (League for Teaching), established by Olivier Faucher, Godfroy Langlois, and Honoré Gervais, attempted to secularize the school system. Two years later the Ligue was destroyed by Archbishop Jean Bruchési; nothing would replace it until 1961. Until 1959 the Catholic Church exercised harsh control over educational institutions. Dissenters were attacked as atheists, though many of them were seeking only freedom in the context of excessive religious and state controls.

On the pretext of protecting Quebec against communism, on March 17, 1937, Premier Maurice Duplessis passed a law on the ideological control of dissidents. Without defining communism, the law allowed the province to declare any person a communist. As general prosecutor, Duplessis became at once plaintiff, judge, sheriff, and executioner. The law authorized him to "padlock" for a year any establishment suspected of harboring communists. It was forbidden to print, publish, or distribute any writing tending to propagate communism. All offenders were liable to at least three months' imprisonment, plus prosecution expenses or one month's additional imprisonment. During the Padlock Law's adoption, Duplessis declared that he was acting to satisfy the archbishop of Quebec, Cardinal Rodrigue Villeneuve. In *Le Jour* (March 12, 1938), Jean-Charles Harvey demonstrated abuses of the law to violate homes, pillage private libraries, and exercise harsh reprisals, all without the possibility of defense. During the "reign" of Duplessis freethinking was severely repressed. On March 8, 1957, the Supreme Court of Canada declared that the law that had given Duplessis such broad discretionary powers was contrary to freedom of thought, speech, and action.

The death of Duplessis in 1959 was the starting signal for the Quiet Revolution, during which Quebec abruptly shrugged off much of its Catholic heritage. The most important achievement of this movement, for which Harvey and the freethinkers never ceased to claim credit, was the reestablishment in 1963 of the Ministry of Public Instruction, which had been abolished in 1875. It was a victory for the Mouvement laïque de langue française (French-language Secularization Movement). Even so, the school system remained under church control until 1997.

Since 1960 Québecois reformers have agitated openly for numerous freedoms: the secularization of public institutions (for example, eliminating crucifixes from public classrooms, hospitals, courtrooms, city halls, and the like); the eradication of religious, racial, and gender discrimination; the right to death with dignity; safe and legal abortion; same-sex marriage; and so on. In 1975 Quebec's adoption of a Charter of Human Rights and Freedoms was seen as a victory for freethinkers. However, the charter did not fully meet the demands of civil libertarians; neither did the Canadian Charter of Rights and Freedoms, adopted in 1982.

In 1981, the Mouvement laïque québécois (MLQ, Secular Movement of Quebec) succeeded the Association québécoise pour l'application du droit à l'exemption religieuse (Quebec Association to Apply the Right of Religious Exemption, 1976–81), its first presidents being Norma Legault, Daniel Baril, and Micheline Trudel. Today this association publishes a journal, *Cité laïque* (Secular City). Another association, La Libre Pensée Québécoise (Freethought Quebec), founded in 1982, closed at the end of the century. Its journal, *La Libre Pensée*, was published twice yearly from 1984 to 1991. Its first presidents were Bernard La Rivière, Henry Morgentaler, and Danielle Soulières. Since the early 1970s Morgentaler has championed the right of Canadian women's to safe and legal abortion (see CANADA [ANGLOPHONE], UNBELIEF IN).

Created on June 10, 2005, by Normand Baillargeon, Bernard Cloutier, and Michel Virard, the Humanist Association of Quebec aims to promote critical thinking and humanist values in Quebec. It revives the late Libre Pensée québecoise with a new basis.

Today, many Quebec historians, like Dr. Jean-Paul de Lagrave, place their emphasis upon rights and freedoms. In spite of the media conformism and religious orthodoxy, in Quebec freethinking is now considered a precious heritage. Dr. Morgentaler, Dr. de Lagrave, Dr. Baillargeon, the MLQ, and many community groups are involved in recognizing and expanding civil and moral liberties. They consider religion a personal affair, not a matter of state. More tolerant than irreligious, they are building slowly but surely a modern, multiethnic, and happy society.

CARLILE, ELIZA SHARPLES (1805?–1852), English freethinker. A courageous FREETHOUGHT campaigner, Elizabeth Sharples was born into a modestly prosperous family in Bolton, Lancashire, England. The Sharples family was deeply religious, and Elizabeth grew up fervently evangelical. She later said she "prayed [her]self into the grave almost." As a young woman, she was told about a wicked agitator named Richard CARLILE. Being of an independent nature, Sharples took an interest in this person who attracted such disapproval at home. She familiarized herself with Carlile's writings and with the radical politics he was involved in, and was soon as committed to the cause as she was to him as her mentor.

Showing extraordinary courage for a young, unattached woman, Sharples left Bolton in January 1832 without her family's permission and headed for London, where she visited Carlile in jail. Two weeks later, on January 29, she gave her first freethought lecture. This is thought to be the first freethought lecture given by a woman. The following month she began a freethought journal called *Isis*, which championed the causes of radical politics, gender equality, and freethought. While formally denying she was an atheist (see ATHEISM), her understanding of God as a first cause was so nominal as to count for nothing. "God," or "first cause," were, she argued, "mere covers for our ignorance." *Isis* folded in December of the same year. After Carlile's release from prison, Elizabeth moved in and became his common-law wife. From about 1834 she called herself Eliza Sharples Carlile. In the face of bitter criticism about her marital situation, she was defiant, writing that a "marriage more pure and moral was never formed and continued in England."

Eliza was an indispensable companion to her husband, taking up an ever-greater burden of work as his health declined. She also had four children by Richard Carlile. The three who survived were given the faultlessly heretical names of Julian, Hypatia, and Theophilia. All three migrated to the United States, where Julian died young in active service in the Civil War. Hypatia died in poverty in Chicago. Only Theophilia lived to anything like old age, dying in California in 1913.

After Richard Carlile's death in 1843, Eliza slowly drifted into complete penury. In 1849 she was rescued by some freethought friends and installed in a large building in London's East End where a coffee room was established. But Eliza had no head for business and the project failed. For a while the young Charles BRADLAUGH stayed in the same building, where he fell in love with Hypatia, although the love was unrequited. Eliza Sharples Carlile died penniless in London in 1852.

BILL COOKE

CARLILE, RICHARD (1790–1843), English FREETHOUGHT pioneer and martyr for freedom of expression. Richard Carlile is known principally for his courageous struggle for a free press in England. He was born in modest circumstances on December 9, 1790, in Ashburton, Devon, where he attended charity schools. At the age of twenty-three he moved to London and quickly became associated with the radical movement. Between 1817 and 1835 Carlile spent more than nine years in prison for publishing freethought material. In 1819 the Society for the Suppression of Vice led a prosecution against Carlile for republishing Thomas PAINE's *Age of Reason.* Carlile insisted on reading the entire book to the court, so that they may know what he was being prosecuted for. He was fined fifteen hundred pounds and sentenced to three years' imprisonment. The fine was impossibly steep and Carlile had no hope of paying it, so his term in prison was extended to six years.

What followed was one of the most outstanding episodes of freethought history. While Carlile was incarcerated, colleagues and employees continued to publish heretical works, and each in turn was imprisoned. Jane Carlile, Richard's wife, was sentenced to two years' imprisonment in November 1819, followed by Richard's sister Mary Ann in 1821. By 1824 approximately 150 people had come, unbidden, to Carlile's shop, in full knowledge that their working there would mean certain imprisonment. But still they came. One such person, Susannah Wright, was imprisoned for eighteen months and fined one hundred pounds. While conducting her defense she was continually interrupted by the prosecution and the judge. What alarmed the judges in each of these cases was not so much the offending material, but that it was directed at the "lower orders," whose servility to their masters, it was feared, would be jeopardized by exposure to such material.

Carlile's persecution attracted the attention of Julian HIBBERT, a wealthy liberal freethinker who provided generous financial assistance for his publishing ventures. It is said that Carlile did not use Hibbert's gift to pay his fine and thus secure release because he found imprisonment preferable to living with his wife. Their marriage ended in 1827. Carlile's later struggles were shared with Eliza Sharples CARLILE, who became his common-law wife in about 1834. In Carlile's decline, he lapsed into a theistic mysticism. He died on February 10, 1843, and was given an Anglican burial, notwithstanding the objections of his sons.

Freethinkers of all persuasions owe Richard Carlile a huge debt. The right to freely publish, circulate, and discuss heretical material was won by his lengthy spells of imprisonment. And thanks to Carlile, it was no longer possible to contrive a successful charge of BLASPHEMY against someone who denied the truth claims of Christianity. From then on, the anti-Christian item had to be specifically abusive or offensive before it could be deemed blasphemous. Carlile should also be remembered as a brave pioneer for birth control (see BIRTH CONTROL AND UNBELIEF).

CARVAKA. A Sanskrit word variously derived from *carv*, to eat, or *caru-vaka*, sweet-tongued, Carvaka is often assumed to be the name of a philosopher and teacher who advocated ATHEISM and materialism (see INDIAN MATERIALISM, ANCIENT). The name is also given to that movement of thought, and to its adherents. What may have been a principal work of the system, the *Brhaspati Sutra*, is lost. Two schools of Carvaka have been distinguished: *Dhurtta* and *Susiksita*.

The Carvakas held that earth, water, fire, and air are the ultimate elements. Only the perceived exists; the unperceived does not exist. There exists no cause except nature. There is no world other than this. There is no heaven and no hell, only mundane pleasure and pain exist. The only supreme is the earthly monarch, whose existence all men can plainly see. The only liberation is the dissolution of the body. From the four ultimate elements, the body and intelligence are produced by mixing the ingredients. When the body is destroyed, intelligence is destroyed. The *Vedas*, the oldest sacred scriptures of the Hindus, are tainted by the three faults of untruth, self-contradiction, and tautology. The Vedic *pandits* (wise men of ancient times) are impostors. The mystical realms of the God Shiva and the like are inventions. The enjoyment of heaven lies in eating delicious food, keeping company of young women, having fine clothes and perfumes, and the like. The pain of hell lies in the troubles that arise from enemies, weapons, and diseases. Liberation (*moksa*) is death, which is the cessation of life-breath.

Carvaka is also known as *lokayata*, "that which is found among people in general" or "materialist," "atheist," "adherent of the Carvaka school." *Loka* means "space," "room," or "world." Together with Buddhism and the Jaina religion, Carvaka has ordinarily been counted as an old heterodox Indian school, as distinct from the six main Hindu schools, which were the orthodox schools. Carvaka philosophy is also known as *barhaspatya*. As a philosophical school it may be almost as old as the oldest Indian religions, but next to nothing is known about its historical development.

CHAPPELLSMITH, MARGARET REYNOLDS (1806–1883), English feminist pioneer. Margaret Reynolds was the daughter of a master mechanic and was raised Baptist. According to freethinker Moncure D. CONWAY, she apparently became the first of the English female Owenites (sometimes referred to as "English Communists") to lecture after she joined Robert OWEN's community near Broughton known as Harmony Hall. According to a letter Chappellsmith wrote to her biographer, Sara A. Underwood, she spoke on a variety of topics, including "Education of Women," "My Reasons why I, having been a Calvinist, have Become an Infidel," as well as five lectures on the Protestant Reformation, and, perhaps most controversial, on the subjects of marriage and divorce (see SEX RADICALISM AND UNBELIEF). She married John Chappellsmith, who endeared himself to feminists by occasionally pouring tea at his wife's public gatherings.

"I frequently took part in public discussions on religion, taking the Infidel side," Chappellsmith recalled. She spoke in London, the midland and northern parts of England, and Scotland. Feminist Owenites were routinely heckled at public meetings by religious opponents quoting scriptural edicts that women should "be in silence." She and other women lecturers, such as free-

thinker Emma MARTIN, were called witches and whores. In Scotland, a Paisley newspaper called Chappellsmith a "she-devil"; a mob of women once gathered around her and threw stones. John Brindley, editor of the *Antidote, or the Anti-Socialist Gazette*, focused on Chappellsmith, making scurrilous accusations that she had deserted her husband and promiscuously taken lovers. Brindley went so far as to seek out her husband, who defended his wife's reputation. In disgust, Brindley then wrote that John was as immoral as that "filthy female lecturer." Thanks to such slander, Margaret was mobbed in South Shields by a group of women and children, who taunted her by asking, "Are you her with the seven husbands?" She wrote, "Poor creatures, they might well be angry with me, since they have been taught to believe me such a monopolizer." Yet Chappellsmith and her sister lecturers were also lauded by many women in their audiences for advocating "new and rational arrangements" of marriage and women's emancipation.

Chappellsmith had had to be induced to lecture, and gratefully ceased her public life by 1843. She and John went into bookselling and emigrated to New Harmony, Indiana (see OWEN, ROBERT DALE). They both continued to write, contributing some three hundred articles to the freethinking *BOSTON INVESTIGATOR*.

ANNIE LAURIE GAYLOR

CHILD, LYDIA MARIA (1802–1880), American abolitionist and freethinker. In her fifty-five-year career, Lydia Maria Child was one of the most prolific and popular authors of her day, addressing such diverse concerns as abolition, women's history, and comparative religious studies. As an activist author, her freethought intellectual achievements were a primary resource for those working toward racial and sexual equality throughout the nineteenth century.

Early Life. The youngest child in a successful baker's family in Medford, Massachusetts, Lydia's strongest early influence was her Harvard-educated brother, Convers. When Convers became the minister of a Unitarian church in Watertown, Massachusetts, Lydia moved in with him and was baptized a Unitarian despite her tendency toward religious skepticism. Her association with her brother's friends Ralph Waldo EMERSON and Theodore Parker further encouraged her religious questioning. Doubting even these friends' liberal interpretations of faith, she would remain a religious skeptic for the rest of her life.

Abolition and Racial Equality. Beginning with her first book, *Hobomok*, a novel challenging racial and religious intolerance against indigenous Americans, Child embarked on a writing career that consistently challenged the supremacy of white American Protestantism. After meeting William Lloyd Garrison in 1830, she dedicated her talents to the abolitionist cause, writing several monographs, most notably *An Appeal in Favor of That Class of Americans Called Africans* (1833). Noteworthy for its support of immediate emancipation, *An Appeal* also called for an end to Northern racism and praised the achievements of African peoples. She paid for this radicalism when subscribers to Child's financially successful *Juvenile Miscellany*, a children's literature periodical published since 1826, canceled their subscriptions in protest, leading to its failure in 1834.

Women's History. Child's contribution to women's history remains underestimated. After writing about the lives of several famous women, Child researched the history of ordinary women to produce *The History of the Condition of Women, in Various Ages and Nations* (1835). This work would inspire and inform a younger generation of women's rights historians and theorists, including Elizabeth Cady STANTON and Matilda Joslyn GAGE, who would use Child's history as a resource to support women's rights and suffragist appeals.

Comparative Religion. During her years as an abolitionist, Child did not forget her early years of religious questioning. The publication of *The Progress of Religious Ideas, Through Successive Ages* (1855) presented the formerly inaccessible academic perspectives of comparative religious and biblical scholarship to a larger popular audience, further undermining Christianity's claim to divine revelation and religious supremacy by exploring connections between Christian and non-Christian mythologies. Her interest in Eastern and pagan spiritualities would deepen and intensify in the following decades providing further inspiration for her life's work fighting racism and religious bigotry.

Until the end of her life, Child remained steadfastly committed to the advancement of women and to the end of discrimination against Asian, African, and Native Americans. As a freethinker, her intellectual openness to religious diversity coupled with her native skepticism enhanced her commitment to the defense of human diversity and equal rights. As one of the most-read authors of the nineteenth century, her liberal influence has been widely felt by generations of liberal reformers.

MELINDA GRUBE

CHINA, UNBELIEF IN. The word universally acknowledged to characterize Chinese thought and values over three millennia is HUMANISM. The connotation of this word is important. It is not to be confused with the philosophy of Western humanist societies, whose aim is to express moral values without recourse to theistic concepts—though Chinese humanism includes this consideration. Equally, it should not be associated with the Christian humanism of the early Reformation period, when the attempt was being made to establish a more academic ethos in Christianity than had been previously manifested—though the pursuit of knowledge for its own sake is a major strand in Chinese culture. Rather, the humanism of China is characterized by an unambiguous assertion of the intrinsic value of life on earth. Whatever the world provides—food, culture, human relationships, nature—is for the present benefit and enjoyment of human beings. It can consequently be contrasted with two widespread and divergent theories of the universe.

The first of these is the Hindu concept of *maya*, whereby whatever the world provides is held to be ultimately delusory because it will not endure forever. The Hindu aim is to seek enlightenment (*moksha*) by realizing the union of the basic self (atman—what Immanuel KANT might have termed the nominal self) with the ground of being, brahman. The second contrasting theory is the theistic view that this world and its activities are no more than an antechamber to heaven. This leads, to a greater or lesser extent, to the development of what Friedrich NIETZSCHE was to describe as "otherworldspeople," who assess moral behavior according to its reflection of the allegedly perfect standards of heaven, and consequently hold the view that human desires and needs must, if necessary, be sacrificed to these "higher" standards. Theists—Jews, Christians, Muslims—are therefore encouraged to look beyond the reality of the present age and view all their activities *sub specie aeternitatis*. Chinese philosophy offers a clear-cut alternative to both of these worldviews by expressing itself comprehensively in terms of this world and its rewards.

It is important to note that, unlike Western humanism, which emphasizes individual freedom and personal fulfillment, Chinese humanism sets greater store on relationships between, on the one hand, individuals and their fellows, and, on the other, human beings and the natural world. The former is expressed primarily (though by no means exclusively) in CONFUCIANISM, the latter in Taoism (see TAOISM, UNBELIEF WITHIN).

Confucius. Confucius held that society could function harmoniously only if everyone recognized and lived consistently within the confines of his or her station. He outlined the five relationships which he affirmed to be the key to social contentment: between husband and wife, father and son (or daughter), older brother and younger brother, older friend and younger friend, and ruler and subject. In all these, he suggested, the first-named should assume the yang (dominant or initiating) role, and the second the yin (secondary or responsive). Most people will thus play a yang role in some of their relationships, a yin in others. Confucius's emphasis on the primacy of age and the male sex stamp him as a man of his era; where he looks beyond not only his own age but also that of many centuries later, is by his refusal to seek authority for his social theories via some kind of divine or nominal inspiration. He rejected the view that excessive attention should be paid to the dead, telling his followers (or students) that their energies and abilities would be comprehensively employed by concerns for the living. When asked whether it was important for people to cultivate the spirits, he replied that they would find quite enough that was worthwhile by developing their minds and keeping their bodies fit. When asked whether people should seek to observe the will of heaven, his answer was that they would find life adequately fulfilling by being involved in earthly matters, without the distractions presented by extraterrestrial concerns. It is true that he frequently spoke of the "way of heaven" (*tsien*), a word in common use in his time, but his usage is metaphorical: the way of heaven signified the highest peak of human behavior. Any hint of the supernatural, such as the belief that by prayer the will of heaven could be mollified or that moral dilemmas could be resolved by divine intervention, seemed to him absurd. Certainly, people would have stories of their ancestors for inspiration, but that is a quite different matter from believing in their spiritual presence and influence.

Two basic features of Chinese thought follow from this Confucian emphasis. First, philosophy and religion are not separated from each other as in the West. Both are concerned with values, answering the question of what is worthwhile. Since no extraterrestrial element is introduced into this discussion, there is simply no need for two separate areas of inquiry, religious and philosophical, as in the West. One significant bonus arising from this circumstance is that the conflict between the two forms of thought often experienced in the West is not found in Confucianism.

Second, philosophy is accepted as a natural facet of life, relevant, as we shall see in particular as related to Taoism, to even the most mundane of activities. Whether one is preparing a meal, choosing one's clothes, or planning a home (feng shui), these apparently routine functions are imbued with significance, since they all are capable of adding to or reducing the individual's well-being, It may be an exaggeration to say that for the Chinese "you are what you eat," but if it is the case that the ideal Indian is a guru, the ideal Chinese could well be a chef.

Taoism. Taoism is second only to Confucianism among the major schools of China. Like Confucianism,

it expresses no belief in a God, an immortal soul, or a life after death. The aim in life for a Taoist is to discover the Tao, the Way, which is the harmony of the twin forces of yin and yang, the negative and positive, the dark and the light, the feminine and the masculine, the submissive and the assertive. Some have suggested that these ideas are not alien to a theistic view of life (for "Tao" read "God") but the Taoist classic the *Tao Te Ching* (Classic of the Way and Its Power) states unequivocally from the first line that the Tao cannot be known or discussed. It cannot even be described as "the unknowable origin of the universe" since it is even more remote than that. The origin of the universe is chi, or vital breath, a word that can also be translated as wind, or spirit. The Tao is the origin of chi, which can be apprehended through its twin manifestations, yin and yang.

We reflect below more directly on the philosophy of these concepts. At this stage we need only state that this means living as closely as possible on natural lines: not trying to outshine nature by outshining one's fellows; recognizing that one is merely an infinitesimal part of the universal processes; above all, treating nature naturally by not interfering with it, a process described as being like an unplaned piece of wood (*pu*). Interference brings harm, not least to the one who interferes. It is in any case not only destructive but also superfluous, like gilding a lily or painting legs on a snake.

A significant outcome of Taoism's advocacy of intuitive living is its rejection of any kind of overriding moral code such as the Ten Commandments or the *Communist Manifesto*. Different circumstances may require different actions: aggression may be the right quality to use when facing a mob, but not when addressing young children in a classroom. This is thoroughgoing moral relativism, which was unambiguously expressed by Chuang-Tzu. Among the Taoist masters he is second in esteem only to Lao Tzu, traditionally held to be the author of the *Tao Te Ching*. Chuang-Tzu argued that nobody could possibly know everything; everyone was blinkered in some way. Consequently, people would show wisdom by being slow to criticize alleged wrongs in others and by being even slower to affirm their own convictions as absolutely true (there is a clear foretaste of John LOCKE here). In a world where values differ inevitably from person to person and from society to society, he said in a famous passage, the impartial arbiter simply does not exist. In words that are hauntingly relevant two and a half millennia later, he argued that there was no such entity as absolute truth: in fact, he throws into question the use of the word *truth* at all when discussing ideas. In this respect he figures as not only a supreme relativist but also an early, if not the earliest, postmodernist.

It should be made clear that this has been a description of philosophical Taoism, *tao-chia*, not magical—sometimes called religious—Taoism, *tao-chiao*. This latter is a more popular expression of the philosophy, and aims, (1) through consuming certain elixirs, (2) by using particular breathing patterns, and (3) by engaging in certain sexual practices, to achieve longevity. But even this school of Taoism seeks longevity on earth, not eternity in heaven. *Tao-chiao* speaks of "immortals," but these are legendary figures, introduced to encourage followers of the way to remain steadfastly on the path.

Yin and Yang. The yin-yang school is older than both Confucianism and Taoism, and has had a marked influence on both. The yin and yang were originally the dark and light sides of a mountain, the significant points being that (1) neither can be dispensed with, (2) each has its period of predominance followed by one of subservience, and (3) each is continuously moving into the other, as day into night into day, summer into winter into summer. Applying this philosophy in human life means learning to recognize when the positive, assertive yang qualities are needed and when the negative, submissive yin; when to speak and when to be silent; when to act and when to do nothing. This is an intuitive, rather than a rational process (yin rather than yang), though both qualities are likely to be needed in various situations. The two forces reach out into every aspect of life—the food we eat, the way we spend our time (actively and passively), managing change in individual and community life, conducting relationships, including marriage. There is no divine guidance for this process: it is entirely a matter of "reading the signs of the times" and proceeding accordingly.

The fascinating outcome of these emphases is that there are no ivory towers for Chinese philosophers: their podium is the marketplace, their campus the home. For example, a major philosophical issue is the content and preparation of meals, which should contain a mixture of both yin and yang foods: too much yin (as with vegans, for example) is likely to create weaklings; too much yang (huge steaks two or three times a day as in the United States, for example) will make for aggressive, if not violent, behavior. Marital relationships will be more harmonious if each partner accepts that in some areas he or she will play the yin role, in others the yang, leaving the complementary role to his or her partner. If both husband and wife always try to express the yang element, the result will be a battlefield; if both settle for the yin, the marriage will be more like a graveyard. Above all, to know—intuitively—whether the yin or the yang should be acknowledged as dominant at any particular moment is to be at one with the Tao and in harmony with nature.

The natural successors to the founders of Confucianism and Taoism—Mencius and Chuang-Tzu—both advocated that human beings engage regularly in periods of quiet contemplation; but it would be wrong to identify this concern as a return to or discovery of religious principles, in the sense that religion necessarily includes a belief in the supernatural. Both teachers bore testimony to an inner awareness, maybe even a transcendental experience, but would have been shocked had these affirmations been

offered as evidence that they were religious in the conventional sense of the word. Their conviction was that there was indeed a transcendental aspect to both nature and humanity, but that this did not imply any otherworldly dimension. They spoke of what they knew or had experienced, and this led them to the realization that human beings, far from needing to rely on God or any other supernatural being in order to make their way through life, could control their own destinies through their own moral decision making. The power of "the spirits" was therefore supplanted by human virtue and human effort.

Other schools in China are more obviously philosophical in a Western sense. The School of Names involves the analysis of words and their meaning, aiming at the avoidance of logical errors in language. The Legalistic School was concerned with the question of effective government and how this was best achieved by using the law to control the people. Mohism (founded by Mo Tzu) was for a period a rival to Confucianism, particularly apropos of Mo's insistence (against Confucius's stress on ever-widening circles of personal responsibility) that everyone everywhere had an equal call on a person's goodwill—an early form of utilitarianism. Some commentators have identified in Mo's doctrine of universal love, or goodwill, an early expression of Christian *agape*. The important point here is that Mo viewed love as a totally human quality, and would have been disturbed to be described as (in the traditional sense) religious. It is worth adding that agape itself is in fact a thoroughly human quality.

With the declaration of a Communist state in October 1949, Chinese schools abandoned the teaching of all Chinese classical writers. This was because of the occasional suggestion in their writings that there were values to be discovered other than the material: For a regime that proclaimed dialectical materialism to be not just the Zeitgeist but also the perpetual philosophy of the people, this teaching seemed a prima facie example of outdated delusions. It was gradually realized, however, that this was a misunderstanding of the classics, and, facilitated by the death of Mao Tse-tung in 1976, Confucianism was restored to every school's curriculum. This restoration did not apply to Taoism, not because of any secret supernatural doctrines which its writings might be held to contain, but because of its seemingly anarchic, if not totally seditious, emphases, particularly as expressed by Chuang-Tzu, whose advice to anyone wishing not to be called upon for government service was the not entirely negative suggestion that they pretend to be totally incompetent. But maybe this is a form of unbelief not relevant in this context.

RAY BILLINGTON

CHISHOLM, GEORGE BROCK (1896–1971), Canadian humanist and cofounder of the WHO. Brock Chisholm was born into a Christian family in semirural Ontario, Canada. His military experiences in World War I, during which he was wounded, affected him profoundly. He enrolled in medical school, graduating in 1924. He established a general practice, which he later developed into the first psychiatric service in Toronto. During this period, he testified for the defense in an early court case about family planning (see BIRTH CONTROL AND UNBELIEF).

In 1939 Chisholm was appointed director of medical services for national defense. He developed a successful assessment test for personnel placement. In 1944 he was appointed deputy minister of public health. Among other things, he gave lectures on the relationship of physical to mental health. In one of these, he remarked that the Santa Claus myth damaged the ability of children to think properly. This sparked an outburst of negative responses from intolerant critics, which he simply ignored.

In 1946 Chisholm was appointed to the UN Commission on World Health. He developed its secretariat, constitution, and standards for appointments, and in 1948 became the first director of its successor, the World Health Organization (WHO). His most difficult task was to get the necessary twenty-six countries to sign on to establish a new organization. Later, he focused on three main goals: strengthening national health services, integrating international health work, and developing an epidemic warning system. He promoted Esperanto as a universal language and warned about the dangers of overpopulation.

Chisholm described himself as a humanist (see HUMANISM). He advocated telling children that there are many competing worldviews. Asked to define God, he said, "I have no such definition, and have not felt the need of one since childhood." He once declined to meet with the pope because policies of the Roman Catholic Church conflicted with those of the WHO. In retirement, he moved to Victoria, British Columbia, where he was in great demand as a lecturer. In 1957, at the invitation of Bertrand RUSSELL, he attended the first Pugwash Conference hosted by Cyrus Eaton in Nova Scotia.

Chisholm published two books and numerous essays and papers. Among many honorary awards, he was named Canadian Humanist of the Year in 1959 and appointed a Companion of the Order of Canada in 1967. He was honorary president of the Humanist Association of Canada in 1968, the same year that Dr. Henry Morgentaler was its president. He died in Veterans Hospital in Victoria in 1976.

CHRISTIANITY, RESISTANCE TO IN THE ANCIENT WORLD.

Introduction: Historical Approaches to Christian Origins

Since the pioneering history of the decline of Rome by the rationalist historian Edward Gibbon in 1776, the study of early resistance to the spread of Christianity has been shaped by competing schools of thought, theological and positivist (see Positivism). Prior to Gibbon, church historians, especially those working in the European tradition and drawing largely on the work of the so-called church fathers, saw the "triumph" of Christianity as being due to divine providence. Typical of this view was the belief that Christianity itself was a final revelation of God within history, and as such was destined to supplant all other forms of belief, ranging from Judaism to the pagan religions, Christian heresy, and competing religious traditions such as Manichaeism and Islam. "Triumphalist historiography," whether Protestant or Catholic theologically, was careless of details, sociologically naive, and subservient to the colonial agendas of the post-Renaissance period. It was shaped by the doctrine that the spread of Christianity was supported by a divine mandate (Matt. 28:19; Mark 13:10) that required the conversion of the world to the Christian faith. The collapse of imperial Christianity ("Christendom"), the fragmentation of the church and its mission after the Reformation of the sixteenth and seventeenth centuries, and above all the Enlightenment of the eighteenth century (see Enlightenment, Unbelief during the), made the older, providential view of Christianity's success untenable. While the effects of the critical view of history, foreshadowed in the fifteenth-century work of Lorenzo Valla, were not felt immediately nor everywhere at the same time, historians outside the theological establishment gradually awakened to the fact that the early years of the church's existence were fraught with uncertainty and internal conflict and that the eventual success of Christianity as a missionary religion could more easily be explained by social and political factors than by supernatural ones. This recognition in itself was devastating to the Catholic position that orthodox Christianity was the product of an unbroken development of authority from the time of the apostles onward (*traditio apostolica*, or apostolic tradition). Valla himself paved the way for later rationalists in his famous 1440 *Declamation on the Donation of Constantine*, in which he showed that a document, used by the popes for centuries to support the doctrine of supreme papal secular authority, could not have been written as early as the fourth century and was instead a medieval forgery. Valla also challenged another cornerstone of Christian belief by demonstrating that the document known as the Apostle's Creed had not been composed by the twelve apostles, a view that caused him to be referred to the Inquisition as a heretic. Ironically, the process of retelling the history of the church was helped by the work of Catholic critics and Protestant reformers, many reared in the classical tradition, who challenged prevailing views of how the church had departed from the teaching of Jesus in structure, polity, and belief. In addition, significant new translations of the biblical texts ranging from Desiderius Erasmus's New Testament (Greek) in 1516 to Martin Luther's German edition in 1522 and that of the Oxbridge translators (authorized by James I in 1611) contributed inadvertently to a new interest in Christian origins, the reliability of ancient texts, and the cultural context of the world within which Christianity grew to maturity. The competing historical interests that spurred research into the history of texts and the evolution of doctrines would eventually undermine the belief that the earliest period of the Christian church was one of pristine innocence and uniform belief.

By the eighteenth century, discussion of the church's beginnings had moved from a purely internal one among Christian historical theologians to the new "professional" class of scholars who took their inspiration from the encyclopaedist tradition of free and critical inquiry (see *Encyclopédie, L'*, and Unbelief). Scholars of this new breed were unencumbered by dogmatic concerns and unconcerned with the disapproval of church authority and often, as in the case of Denis Diderot and Voltaire, outwardly satirical and skeptical in dealing with the claims of the old historiography. Gibbon himself represented a school of thought that understood the ultimate success of Christianity as being due to both extrinsic and instrinsic causes. Like many intellectuals of his day, he regarded much of the dogmatic tradition of Christianity as little better than superstition. He debunked the myth of Christian martyrdom by deconstructing official church history that had been perpetuated for centuries. Because the Roman Catholic Church had a virtual monopoly on its own history, its own Latin interpretations were considered sacrosanct, and as a result the church's writings had rarely been subjected to scrutiny. For Gibbon, however, they were secondary sources: the same Latin documents merely translated by previous apologists. Gibbon eschewed these, and never referred to them in his own history. According to Gibbon, Romans were far more tolerant of Christians than Christians were of one another, especially once Christianity gained the upper hand. Christians inflicted far greater casualties on Christians than were ever inflicted by the Roman Empire. He extrapolated that the number of Christians executed by other Christian factions far exceeded all the Christian martyrs who died during the three centuries of Christianity under Roman rule. This was in stark contrast to Catholic church history, which insisted that Christianity won the hearts and minds of people largely because of the inspirational

example set by its martyrs. Gibbon proved that the early church's custom of bestowing the title of martyr ("saint") on all confessors of faith grossly inflated the actual numbers. Christianity succeeded by default: because of the wide appeal of its superstition, the "dēcadent" condition of Roman religion (his most speculative point), and the intolerance of its propagandists. Opposition to his work (labeled "paganist" by his challengers) was an episode in intellectual history second only to the opposition to Charles DARWIN in the following century (see DARWINISM; EVOLUTION AND UNBELIEF).

The advances in historical criticism of the nineteenth century and beyond saw an emphasis on situating Christianity among the religions and cultural movements of the Roman Empire. The work of scholars such as F. C. Baur, Franz Cumont, Wilhelm Bousset, Richard Reitzenstein, Adolph von Harnack, and perhaps most importantly Walter Bauer and Martin Werner paved the way for modern assessments of the critical period in Christian origins. In conjunction with the work of classical, "crossover," and Near Eastern historians such as E. R. Dodds, Werner Jaeger, A. Travers Herford, and A. D. Nock, trendsetting studies appeared leaving almost no aspect of Christianity's association with the mystery religions, hellenistic Jewish traditions, and rival philosophical schools unexamined. The summation that follows draws on the work of these and more recent scholars, with special reference to (a) Jewish resistance to Christianity and (b) the Roman-pagan intellectual and moral critiques of the Christian religion between the second and fourth centuries.

JEWISH RESISTANCE

Christianity's dependence on Judaism for its core doctrines—belief in a Messiah who would deliver his people and a spiritual view of God's salvation of his people through an atoning sacrifice—was never denied in the early church. The New Testament writers drew freely on the Hebrew Bible to support its notion that Jesus had been the fulfillment of the prophecies of the Old Testament. They made equally liberal use of Jewish eschatology and apocalyptic ideas, which placed believers at an "end time" in relation to world history and envisioned God as a severe judge of the enemies of his chosen people (Ezek. 36). Greco-Jewish ideas of eternal reward or "afterlife," the suffering of the unrighteous (Ezek. 33), the judgment of the world, and the deliverance (salvation) of the righteous, were integral to apocalyptic ideology, which completely suffused Christian thinking in the first decades of the sect's existence. Christianity differed from Judaism largely in making Jesus the unique espouser of ideas completely familiar to hellenistic rabbis, a fact that led both Jewish and pagan critics of the new religion to harangue Christian preachers for their unoriginality. One of the earliest examples of a Christian dispute is the (fictional) debate between Justin Martyr, a Syrian theologian, and a Jewish teacher named Trypho, dating from around 170 CE. From it and scattered references in other pieces of early Christian literature we are able to trace the main lines of Jewish hostility to the early Christian church. Some of these criticisms occur later on in the writings of Roman intellectuals, who seem to have given a fair hearing to both sides in disputes such as the one created at the end of the second century by Justin.

Resurrection and the Resurrection of Jesus. The belief in resurrection was not a uniform doctrine in the sectarian Judaism of the first century CE. Some Jews, especially those in the rabinnical tradition called Pharisaism, seemed to hold to the view that the dead would rise in order to be judged by God on the last day. Others, namely, the sect of the Sadducees and other unaligned traditionalists, held the view that the idea of resurrection had been imported into Judaism through Greek-inspired interpretations of the Hebrew bible, especially the book of Ezekiel (36:26–37:28) dating from perhaps the sixth century BCE. Neither tradition was in complete harmony with the Greek-Platonic belief in the immortality of the soul, which argued vigorously in favor of the decadence of the body. The earliest Christian preaching seems broadly to conform to the Pharisaic view of resurrection, but exceeds it in the belief that Jesus, with Elijah and perhaps Moses (the attendants of Jesus in the story of the "transfiguration," Mark 9:4f.), had survived death and would come again as the expected judge of the world (Dan. 7:11–13; Mark 13). The story of the resurrection of Jesus, probably the earliest element of the Jesus tradition to circulate and win a hearing, was widely if not universally (1 Cor. 15:12) understood to mean that all Christians would share his fate, a spectacular claim even in an acutely religious era. Paul, writing in the fifties of the first century, expresses the view that the Christian faithful will be "awakened" by the sound of a trumpet, joining those who are still alive at the time of the event to be judged by the "Lord in the sky." (1 Thess. 4:15ff.). Significantly, for the early missionaries, Christianity was a "resurrection faith," and without an explicit belief in the bodily resurrection of the dead, incorporating the resurrection of Jesus Christ as its model, one was not entiled to be called Christian (1 Cor. 15:12–34). While many of the so-called mystery religions of the Roman world preached a belief in immortality, Christianity was unique in its emphasis on the material and physical nature of the afterlife.

Jewish hostility toward the early preaching centered therefore on the Christian doctrine of resurrection, and seems to have come largely from the Pharisaic side, as mediated by the rabbis after the destruction of the Jewish temple in 70 CE. Where the Pharisaic belief was speculative, symbolic, and nuanced, Christian belief in resurrection, as conveyed in their stories, was crude and specific. The earliest stratum of Judeo-Christian belief in the resurrection seems to have arisen from the view that Jesus was a completely "righteous" man, one whose sit-

uation in relation to Jewish law made him innocent of sin and hence worthy to be spared the "punishment of death," widely thought in Jewish theology to be the consequence of sin (Gen. 6:3). In the synagogues where Paul and other missionaries preached with variable success, they began with the simple asseveration that Jesus "had not been abandoned to Hades, nor did his flesh see corruption," as a sign of his special status, or "divinity" in the hellenistic lexicon (Acts 2:31). This preaching was often joined to the belief that the resurrection of Jesus corroborated his status as "Kyrios" ("Lord," an honorific title ambiguous enough to cause offense to some listeners and not to others) and "Christ," a term loosely equated with the Jewish idea of Messiah, but also with the idea of divine sonship or kingship—an "anointed man," set aside for a specific role. The title that seems to have caused the greatest offense to Jewish audiences was the use of the Greek phrase "son of God," also employed by the emperors in token of their divine status, as a title for Jesus (Matt. 26:63).

Synagogue leaders first tried persuasion to prevent the missionaries from interpreting scripture in unacceptable ways (cf. Luke 4:16–30). When this failed, they resorted to more extreme measures, ranging from flogging, as happened to Paul on a number of occasions (2 Cor. 11:23–26), and occasionally to execution by stoning, a remedy Paul himself prescribes for certain forms of apostasy (1 Cor. 5:2; Luke 4:29). The purging of Christians from synagogues seems to have begun systematically in the mid-first century, though there is evidence that eastern Christians continued occasionally to attend synagogue meetings well into the third century. The language Paul uses to describe his own efforts to roust cells of Jesus believers from synagogues in Asia Minor suggests a program dating at least from the forties (Gal. 1:13–15). While there is no evidence prior to the end of the first century that Christianity was driven underground by these measures, Jewish hostility on all sides seems to have caused fractures in the movement. As a result, a Jerusalem faction headed by Jacob, or "James," the brother of Jesus, arose sometime in the forties of the first century and was characterized by a type of preaching designed to conciliate the rabbis and perhaps also to mitigate some of the more extravagant messianic claims made on behalf of Jesus. This James "party" may never have had an official sectarian status—Josephus, for example, knows nothing of them—but seems to have held to a fairly rigid ethical code, to have practiced circumcision, kept the dietary laws, and retained sabbath practice as the core of their corporate life (Acts 3:40). They do not seem to have had any teaching regarding the birth of Jesus (the party was headed by a caliph, Jesus's closest biological relative) and their exact views on the resurrection are unknown. They were undoubtedly aligned with the more extreme apocalyptic sects and hence may have run afoul of Roman authority because of their prior association with an executed dissident. A quite separate faction, brought into fictional harmony with the James faction in the Acts of the Apostles (written around 100 CE) minimized Jewish tradition, abandoned sabbath regulations by inventing a new feast for celebrating the resurrection of Jesus, the *dies domini* or day of the Lord, and deliberately emphasized the significance of Jesus as a savior god, comparable to those found in all corners of the Roman world. This party seems to have attempted conciliation with the Jerusalem church throughout the fifties and sixties of the first century, but then to have positioned itself politically and theologically to take advantage of growing Roman hostility toward the Palestinian client kingdom of Judaea. Paul's letters provide the basic documentation for the success of this faction. While the Jerusalem church was destined for extinction, the church outside Palestine survived to tell the story of Jesus in its own and intensively anti-Jewish way.

Resistance Following the Destruction of Jerusalem. The end of an independent Palestinian Judaism ended only the internal struggle between the rival forms of messianic faith. No longer able to punish the "Nazarenes" as homegrown apostates in official tribunals, Judaism also lost what influence it may have had over the more extreme forms of Christian messianism. Much of the evidence for Jewish resistance post-70 is discernible from Christian lines of defense in the New Testament, especially the gospels, and falls broadly into three categories: attacks on a discredited Christian apocalyptic message; historical criticism of the resurrection; and attacks on Christian abuse of Hebrew prophecy. A fourth and less significant line of resistance, dating from the Talmudic period but expanded throughout late antiquity and the early Middle Ages, comprised literary attacks on the moral character of Jesus and his family, a polemical device familiar in antiquity and identical in purpose to later Christian slanders concerning the life and character of Muhammad.

The attack on Christian apocalypticism dates from before the destruction of the temple, since earliest Christian belief seems to have included the idea that the return of Jesus from heaven would be swift and sure, or at least within the lifetime of many who had heard him (Mark 9:1, 13:20; 1 Thess. 4:15; Matt.10:23). The specificity of this belief was subject to interpretation, recasting, rationalization, and disconfirmation. From the Jewish standpoint (for instance, Isa. 65:17) the apocalyptic catastrophe was often seen as a way of purging the earth rather than a way of annihilating creation. By the time the polemical New Testament letter known as 2 Peter appears (around 110–120 CE), a strong element of Jewish skepticism toward the inevitability of the judgment had developed, making the Christian belief a matter for ridicule. There an unnamed critic is described as complaining, "And now where is the promise of his coming [again]? Ever since our ancestors fell asleep, things have continued just as they were at the beginning

of creation." Indeed 2 Peter caps a skeptical tradition dating from fifty years earlier when Paul confronted sarcasm about the second coming of Jesus in the Christian community at Thessalonike, a situation probably instigated by Jewish and possibly even Jewish-Christian teachers attempting to discredit him (1 Thess. 4:1–13).

According to Jewish detractors therefore the most obvious deficiency of the Christians was their inability to corroborate Jesus's promise to return to reveal his true identity and their apparent readiness to invent various stratagems to explain the failure away. These stratagems would have arisen in reponse to particular charges leveled by Jewish teachers: Christians argued, for example, that before the last days the gentiles would be converted (Mark 13:10), that the power of the emperor would fade (Rom. 16:20), that a cosmic battle between the powers of good and evil would take place (2 Thess. 2:2–10), and in what may be the earliest level of attack and defense (since it violates earlier prophecies of Jesus), that Jesus himself had professed ignorance of the time (Mark 13:32) and later, that he had refused to speculate about the signs of the last days (Mark 8:11–12; cf. 1 Thess. 5:1–7).

A consistent feature of Christian defense was the belief that the crucifixion and resurrection of Jesus formed a transition between two ages, an old and corrupt period characterized by sin, and a new age that would see the dawn of redemption (Luke 12:49–56, 17:22–37; Matt. 12:38–42). Accordingly, Jewish rhetoric emphasized that the death of Jesus did not conform to any prophecy of their tradition and that the resurrection story had been fabricated by his followers to escape humiliation. The first of these assertions—that Christianity mangled Jewish prophecies and twisted the original meanings of the oracles—was potentially devastating for the new cult. The messianic status of Jesus, the doctrine of the last days, and the honorific titles "Messiah," "Son of Man," and "son of David" had specific reference to Jewish history. In the *Dialogue with Trypho* (ca. 168) the Christian Justin represents the Jewish teacher as conceding every objection except the idea that the Messiah was destined to suffer and die. This suggests that of all points of discussion, the Jews were the most insistent that Christianity was a perversion of their messianic hopes, which after the destruction of Jerusalem tended to become future-oriented in contrast to Christian belief that the savior had already appeared. In close connection was Jewish emphasis that the death of Jesus had been humiliating and final, and that the resurrection itself had been fabricated to support Christians' already eccentric glosses of prophecy. What "Christian" prophecy was in supporting the belief that the death of Jesus unfolded by divine plan, the resurrection and the corollary doctrine of a second coming were in revealing his "true" identity and making sense of his suffering. The poetic language of Isaiah 52:13–53:12, sometimes called the Fourth Servant Song and applied by the Hebrew prophets to the disfigurement of Israel at the hands of its oppressors, was taken over by Christian teachers and applied to the death of Jesus. Equivalent misuse of the Hebrew texts was employed to support a variety of elements of Christian teaching—for example, Isaiah 7:14, originally applied to the restoration of Israel through the presence of God (Immanuel), was applied by Christian teachers like Matthew to the innovative doctrine that Jesus had been born of a virgin, despite the fact that the Hebrew text uses only the term for "young woman" (*almah*).

Christians were often driven to such interpretations out of apologetic necessity. Lacking the political power to control the Jesus movement, Jewish polemic insisted that following the burial of Jesus his followers stole his body after bribing guards at the tomb (Matt. 28:15), a story already persistent by the waning days of the first century. Jewish charges that Jesus was an absent savior, a charlatan who had deserted his misled followers, were answered by the doctrine of the mystical presence of Jesus in the community (Matt. 28:20), or, in a development derived from the Elijah-Passover tradition, that Jesus was present in the breaking of the bread (Mark 14:22f., pars.; Luke 24:30ff.) and concocted jesuine propohecies wherein Jesus himself becomes the legitimator of his own death (Mark 8:31, 9:30f., 10:45f.; Luke 24:6). The doctrine of the "Holy Spirit," which later becomes a feature of trinitarian Christianity from about the third century, seems to have begun as a way of defending against the Jewish charge that Jesus had abandoned his community following a humiliating and unexpected failure to win an audience in Jerusalem; remnants of this defensive posture are common to the New Testament itself (John 20:22; Luke 24:21, 24:49), especially in the inconsistent narratives known as the "departure stories" (Mark 16:19f.; Luke 24; Matt. 28:16; John 20:16–20).

Later Resistance: The Toldoth Yeshu. Jewish resistance to Christianity continued unabated throughout the first three centuries of the common era and informed Roman polemic (below) as well. With the dawn of Christianity as an imperial religion in the fourth century, public Jewish opposition was destined to abate. In the intervening period, random attacks on the Christian gospel gradually become a part of a folklore tradition, embodied partly in revisions of the Talmud, and partly in nonrabbinical legends known as the *Toldoth Yeshu*. In these traditions, Jesus (Yeshu, though the name may not be identical) is the son of a certain Miriam who is impregnated by a Roman soldier (or betrayer of Jewish law) known as Panthera. In the *Tosefta* references to Yeshu, the title ben-Pandera (son of Pandera) is added after the name. The Latin name, derived from Greek *pantheras*, literally meaning "panther," is unusual but not unknown.

The Yeshu of these sources is also known as "ben Stada," or "the son of one who has gone astray," presumably a reference to his mother's situation or to his own apostasy from Judaism. It is possible that this tradition is

early and the gospel account of the virgin birth is an attempt to supplant it. Ben-Stada is also mentioned in the Jerusalem Talmud. In Shabbat 12:4 III he is mentioned as having learned magic by cutting marks in his flesh. In Sanhedrin 7:12 he is recalled as an example of someone caught doing magic by hidden observers and subsequently stoned (cf. Mark 2:23). The references to magic are in keeping with Jesus's reputation as a healer and magician, and it is sometimes suggested that rabbinical opinion was divided in the first century about whether Jesus should be revered for his ability to perform miracles and enact healings, an issue already implied in Mark 3:20–24.

While confused over time, elements of the *Toldoth Yeshu* seem very ancient. In 178 CE the pagan writer Celsus, in his polemic against Christianity, claimed that he had heard from a Jew that Mary had been divorced by her husband after having an affair with a Roman soldier named Pantheras who was the real father of Jesus. The main import of this tradition is that it indicates a *tranche* of Jewish thought which understood Jesus as a garden-variety magician and apostate from Jewish teaching. The dating of individual elements of the tradition make its use as a historical source—for example, as Jewish corroboration of the life of Jesus—impossible.

Roman Resistance

It is common if not unproblematical to date the persecution of the Christians from the time of the great fire of Rome in July 64, during the reign of Nero. The source of this opinion is a single passage in the *Annals* of the historian Tacitus, written between 112 and 120 CE, some sixty years after the events he describes:

> Therefore, to put an end to the rumor Nero created a diversion and subjected to the most extra-ordinary tortures those hated for their abominations by the common people called Christians. The originator of this name (was) Christ [Chrestus], who, during the reign of Tiberius had been executed by sentence of the procurator Pontinus Pilate. Repressed for the time being, the deadly superstition broke out again not only in Judea, the original source of the evil, but also in the city (Rome), where all things horrible or shameful in the world collect and become popular. So an arrest was made of all who confessed; then on the basis of their information, an immense multitude was convicted, not so much of the crime of arson as for hatred of the human race.

While the precise meaning of Tacitus's phrase "hatred of the human race" and the source of his opprobrium for Christianity remain uncertain—many scholars have suggested Jewish reports and intrigue—the passage is broadly expressive of the growing suspicion of Christians by pagan intellectuals. It is not certain however that the hostility Tacitus records can be dated from as early as the middle decades of the first century, before, indeed, the existence of any written gospel.

Political Resistance. Systematic resistance to Christianity in the form known as *persecutio* or *coercitio* does not arise before the early second century. Traditional scholarship names ten periods of persecution, dating from the time of Nero and including the reigns of Domitian, Trajan, Hadrian, Marcus Aurelius, Septimus Severus, Maximus the Thracian, Decius, Valerian, and Diocletian/Galerius. Of these, only the persecutions under Marcus Aurelius, Decius, and Diocletian seem to have been violent; it is clear that their effectiveness as a form of resistance was questionable from as early as the late second century, when the church father Tertullian boasts that Christians occupy positions of importance throughout the Roman world, and that without the support of the church "the emperor would find himself without an empire to rule." Trajan's policies are the earliest well-documented ones, being known from a letter written to him by the governor of Pontus, Pliny the Younger around 111, and answered by the emperor himself. In this correspondence, Pliny seems uncertain what to make of the new cult—one he does not recognize from the register of "licensed" practices—and is instructed by the emperor to be lenient with its adherents unless they persist in their mischief, whereupon the governor is given permission to punish the accused parties. Trajan's policy is remarkable in its leniency: Christians are not to be hunted down; their recantations are to be taken at face value; and anonymous pamphlets and accusations are to be disregarded in any case involving the new sect. With the passage of time and growing concern that the sect had begun to acquire members among the imperial classes, persecutions worsened. By the time of Decius the repression of Christianity became programmatic, though much of the evidence for this persecution comes not from secular but church history. Early in 250 Decius issued the edict for the suppression of Christianity. Measures were first taken demanding that the bishops and officers of the church sacrifice to the emperor, a matter of an oath of allegiance that was taken by Christians as profoundly offensive. Just at this time there was a second outbreak of the Antonine Plague, which at its height between 251 and 266 was taking the lives of five thousand a day in Rome. This outbreak is referred to as the Plague of Cyprian, who was the bishop of Carthage, where both the plague and the persecution of Christians were especially severe. Christians were blamed for the spread of the disease in much the same way Jews were used as scapegoats during the spread of the Black Death in the Middle Ages. The effect in this case, however, was to create a new class of martyrs which would serve as inspiration for the spread of the movement. The Diocletian persecution, the last before the legitimation of Christianity in 312–13, was severe largely because it represented a "sweep" of the empire.

Lactantius informs us that Diocletian acted under pressure from his advisors on the advice of a council of dignitaries in which Galerius played the principal part. Persecutions began in 303, the nineteenth year of his reign. This general outbreak had been preceded for three years at least by a more or less disguised persecution in the army. The Christian writer Eusebius says that a certain Veturius, in the sixteenth year of Diocletian, forced a number of high-ranking officers to prove their loyalty by the usual test of sacrificing to the gods of the empire, on penalty of losing their honors and privileges; in the process many officers were identified as Christians and executed. On February 23, 303, the Church of Nicomedia was torn down by order of the emperors. The next day a first edict was published throughout the empire ordering the churches to be destroyed, the sacred scriptures to be burned, and "inflicting degradation on those in high rank and slavery on their households." Two other edicts soon followed, one ordering the imprisonment of all church officials, the other commanding them to sacrifice to the gods. These edicts were repealed in the first year of Constantine's reign (312), which also marked an end of the official persecutions of the Christian Church.

The Literary Attacks on Christians. During the period of public persecution, and taking inspiration from it, a succession of philosophical and literary attacks against the Christian religion appeared. The earliest of these have not survived, but their substance can be known from the writings of the Christian apologists such as Tertullian, Justin Martyr, and Tatian, writing in the second and third centuries. Early views of the Christians included the opinion that they were poor citizens (they refused military service, avoided public events, and refused the sacrifices), were dangerous to public order, and had invented their religious ceremonies by taking bits and pieces from established customs and perverted their meanings. In the course of time, as Christianity and its potential for harm to the established order became widely recognized, these charges became more specific. Romans were especially suspicious of Christian ceremonies, and from the second century began to see similarities between the language used in the Christian eucharist and the love-feasts of the Bacchae, the cult of Dionysus that Rome had tried repeatedly to bring under control. The Latin writer Marcus Cornelius Fronto reported that the Christians were accustomed to sacrificing infants and to incestuous practices of various sorts. Among the other charges brought by early polemicists against the church, Tertullian mentions treason, cannibalism, murder, and, above all, ATHEISM—the last stemming from Christians' unwillingness to recognize the state gods of the empire. While some of the charges are transparently slanderous—the reference to incest seems to stem from the Christian habit of addressing fellow believers as "brother" and "sister"—other charges concerning the excesses of the movement are borne out in what is today known of the habits of fringe and extremist Christian communes.

By the middle decades of the second century, named opponents of the movement begin to proliferate. The cynic philosopher Crescens sees the Christians as "impious" troublemakers who revel in their "mischievoius atheism," while the rheorician Lucian of Samosata satirizes the cult's teachers as philosophical bumblers and the laity as simpletons who are prepared to believe anything they are told by their teachers. Christian martyrdom, used persistently by Christians as proof of their unwavering faith, is seen by the philosopher Epictetus as "sheer obstinancy," and by Marcus Aurelius as "mere suicide without moral value." The medical theorist Galen also took notice of the new religion, commenting that the followers of Christ "are unable to follow any demonstrative arguiment . . . and hence need parables and miracles" in order to lead a moral life. No pagan intellectual of the second or third century came to the defense of the new religious movement.

The Authors of Persecution. The faith of the Christians remains the focus of pagan poelmic from Galen's time onward, and is especially central to the works of the so-called authors of persecution (the name given the three by their Christian opponents): Celsus, Porphyry, and the emperor Julian (the "apostate"). Writing at the end of the first century, Celsus produced fifteen books against the Christians titled *The True Doctrine*, a pun intended to show that the Christian teaching was inferior to the true philosophy and religion of the Greeks. Lost to history after the fifth century, his work is only available from quotations in the writings of the church father Origen. Celsus regards Christianity as a danger to the Roman order, and cites as proof Christians' unwillingness to practice their rituals in the open. An unoriginal faith, it borrows, then subverts, the teachings of the Jews and adds to them the worship of a man "of recent date," condemned as a criminal, but thought by them to be the son of God. Celsus seems to know bits of the Jewish polemical tradition (most of his critique is delivered from the lips of a fictional dissenting Jew): Jesus's death had been unexpected; Christian scripture is contradictory ("if the story of Herod's slaughter of the newborns was designed to prevent you from becoming a king, why did you not become one?"); his life was lived in seclusion, and he was not even able to convince his disciples of his divine status. Celsus finds the resurrection of Jesus risible because it was not witnessed by anyone of repute; moreover, the Christians seem unaware that "multitudes have invented similar tales to lead simpleminded hearers astray." Perhaps the most renowned part of Celsus's critique is his view that the Christian themselves are drawn from the least intelligent caste of Roman society—a clutch of "wives, children, and beggars" who accept on faith what they cannot defend in reasoned debate.

The philosopher Porphyry, writing in the third century, was arguably more influential than Celsus. His books against the Christians (*Kata Christianon*) suffered

the same fate as those of his predecessor, but are known from scattered quotations in patristic writings. Porphyry regards the Christians as a seditionist sect that hides behind acts of philanthropy to divert public attention from its true aim—political control of the empire. He shares with Celsus the belief that Christians come from the lowest and most gullible orders of Roman society, and is especially emphatic about the "absurd" nature of their stories. The gospels are full of preposterous tales, written in barbarous Greek, and not worth the attention of anyone seeking to know the truths of philosophy and religion. Much of his work was devoted to pointing out inconsistencies in the biblical accounts, contradictions in the writings of the evangelists concerning the birth and teachings of Jesus, and historical problems affecting their interpretation of prophecy. Porphyry is one of the first pagan observers to play close attention to the text of the New Testament, calling to attention discrepancies in the stories of the crucifixion and resurrection of Jesus. He seems to have been the first to suggest that the book of Daniel, a centerpiece in Christian apocalyptic thinking, had been written in the second century BCE, not in the sixth, and that Christian apocalypticism was disproved by the passage of time. Some of his most vicious language is reserved for the apostles Peter, a dullard, and Paul, a hypocrite by his own admission—vices Porphyry sees as especially typical of the cult's adherents. Toward the end of his work, he offers a scathing examination of the Christian belief in bodily resurrection, which he contrasts with the Greek understanding of immortality.

Following a period of Christian governance between 313 and 361, the pagan emperor Julian attempted a restoration of Roman religion before his death in 363. Julian's would be the last sustained attempt to rescue the Roman state from the advances of the Christian Church, a venture ultimately unsuccessful due to his premature death in the Persian campaign. Julian's energetic anti-Christian program is known to us through his correspondence, the work of his biographers, and a few remnants of his long treatise *Against the Galileans*, which was burned by imperial decree in the fifth century. Unlike his predecessors, Julian's tirade against the church comes from one who was probably raised a Christian, but was influenced by Greek teachers to embrace the old religion, the classical writers, and philosophical schools. Only after he became emperor did Julian reveal his agenda, which did not involve persecution but restraint of Christian teachers and infusions of money and energy into his program for reviving the temples and pagan priesthoods. Julian issued rescripts (bans) against Christian schoolmasters, personally intervened in theological disputes throughout the empire, encouraged the growth of Greek philosophy (an amateur philosopher himself), and offered, as a gesture of conciliation, to rebuild the Jewish temple in Jerusalem—an affront to the Christians who had seen its destruction as an irreversible prophetic sign. Julian's books against the Christians are less poignant and far more pedantic than those of Celsus and Porphyry, and he repeats many of their arguments. His purpose in *Against the Galileans* is to document the inferiority of Christian belief to ancient philosophy, while at the same time refuting the Christian claim that the church is the fulfillment of Hebrew prophecy. He is one of the first thinkers to insist that the real vice of Christianity is the intolerance of its believers, which he contrasts with the religious generosity of the Greeks. A consistent theme of the treatise is that Christianity is a "disease" which, left uncontrolled, would destroy the intellectual and spiritual life of the empire. On his death in 363, Julian was succeeded by the Christian emperor Jovian, who in concert with the rigorist orthodox bishop Athanasius initiated the process of restoring the prerogatives of the Christian Church throughout the empire. In an ironic twist that would not have escaped Julian, Jovian died a year later in February 364, asphyxiated by fumes from the fresh paint and plaster in the room prepared for him at Dadastana on his journey from Antioch and the East to Constantinople.

CHRISTIANITY, UNBELIEF WITHIN. Unbelief—that is, the existence of doubt, of withholding belief or SKEPTICISM regarding certain religious practices and beliefs—has been present in the Christian religion since its beginnings. The early Christians were in doubt about numerous crucial issues in their religion: discipline, worship, authority, even contesting creedal statements. Moreover, the church established authoritative (canonical) scriptures that included many accounts of prophets and sages doubting and challenging long-held beliefs and practices. In the *locus classicus*, the book of Job, the hero steadfastly refuses to believe two ancient Hebraic theodicies: the Deuteronomic writers' insistence that suffering is the recompense for sin, and the claim that Job's excruciating suffering is God's test of his faith. For Job, God's purposes remain beyond understanding, transcendent and hidden "things too wonderful for me to know" (Job 42:3).

By the second century CE, Christianity was prompted to adapt its practices and the formulation of its beliefs to its new Greco-Roman Hellenistic environment (see CHRISTIANITY, RESISTANCE TO IN THE ANCIENT WORLD). Of particular importance was its engagement with Greek and Roman philosophy, in an effort both to adopt Stoic and neo-Platonic language and categories to better articulate its beliefs and emerging creedal statements (see STOICISM; PLATO), but also to challenge Hellenistic doctrines such as, for example, Manichean and Gnostic dualism and Greek and Roman academic skepticism (PYRRHONISM and the thought of CICERO) that appeared to challenge fundamental Christian beliefs. Thus began a philosophical dialogue that, with some lapses, remained vital to both parties to the present day. In this engagement we see that the question of unbelief and epistemological skepticism, and of religious belief or faith, were close to the center of both the philosophical and the theological enterprises.

While Pyrrhonism died out as a movement by 300 CE, its influence was briefly revived by Saint Augustine in his exploration of the skepticism of the Academy in his *Contra Academicos.* Augustine recognized that Pyrrhonism had to be engaged to overcome his own "despair of finding truth." Also, it could be used to undermine the dogmatic materialism (see MATERIALISM, PHILOSOPHICAL) of the Stoics and Epicurians (see EPICURUS). In his dialogue Augustine charges that while the Skeptics declare that wisdom entails the continuing withholding of assent, they also give unqualified assent to their fundamental thesis—that wisdom entails the continuing withholding of assent—thus demonstrating that even the Skeptics are certain of some truths, as, for instance, that of two disjunctive propositions one is true and the other false. He then argues that because we human beings can doubt, we can be sure we exist, "for if you did not exist, you could not be deceived in anything." Here Augustine anticipates René DESCARTES. The bodily senses may deceive us, but we cannot deny the certain knowledge that the mind has of its own existence. But for Augustine, human understanding is not solely a matter of *intellect.* With Plotinus, he perceived the crucial relation between human knowledge and the moral life, thus the importance of the role of human sentiment and the will, or the faith factor, in all knowledge. Augustine declares that faith precedes REASON because "*nisi crediteritus, non intelligetis*: unless you believe, you will not understand." For Augustine, faith is understood as an act of intellectual assent, not simply trust.

The Augustinian view of the relation of reason and faith is crucial, for it largely dominated the debates on the subject throughout the Middle Ages. Augustine's Christian Platonism, with its confidence in reason, did prove to be a double-edged sword, since his doctrine of illumination gave such a dominant role to divine intervention. In later medieval nominalism—Duns Scotus and Occam and their followers—this resulted in skepticism regarding knowledge of God. To protect the *potentia Dei Absoluta*, the Occamists claimed that God could deceive—that is, that natural laws could be changed through divine intervention—hence the whole structure of natural knowledge was potentially shaken by this skepticism.

Early modern religious skepticism was also influenced by vestiges of Augustianism, as well as by nominalism, but also by events that were to transform Western conceptions of the world. One event was the Renaissance recovery of the intellectual heritage of Greek and Roman literature and philosophy, including important Pyrrhonist texts; also, questions were raised regarding the Christian worldview, the result of the new discoveries of Asia and the Americas; and, finally, the skepticism engendered by the emerging scientific revolution profoundly threatened Ptolomaic cosmology and its theological worldview.

Especially significant for our subject was the rediscovery, by Christian humanists, of the texts of Sextus EMPIRICUS and Cicero which helped to cast doubts about the doctrines of medieval Catholic scholasticism. In similar fashion, the Christian humanists' investigations of textual variants in the Bible, provoked by new manuscript discoveries, ignited a theological revolution. Desiderius ERASMUS, a Catholic priest, was a central figure in this intra-Christian theological dispute. Erasmus's mind was a rather complex union of the pure classicism of Cicero and Plutarch and the moral spirit of

biblical Christianity. He detested the logical hairsplitting and doctrinal disputes of the Scholastic theologians and, in *The Praise of Folly* (1509), his supreme humor, irony, and skepticism are directed at the sophistry and deceit of his Catholic Church. Ironically, while Martin Luther's reformation is considered a foundation of modern religious freedom, Erasmus abhorred Luther's own penchant for doctrinal doubt and contention as unnecessary, divisive, and destructive of the unity of the faith.

Erasmus's response to Luther, in *Diatribe concerning Free Choice* (1524), is essentially a skeptical indifference toward such theological enigmas as freedom and DETERMINISM. As he wrote, "So far am I from delighting in 'assertions' that I would readily take refuge in the opinion of the Skeptics. . . . We need only contemplate [God] himself in mystic silence." Luther, in turn, rejected Erasmus's simple moral piety, insisting that the Christian mind does, necessarily, make assertions. Yet Luther's own theological belief is, in fact, less one of intellectual assent (*assensus*) than it is *fiducia*, or the inclination of the heart and will in trust and confidence. Doctrine, for Luther, is but the attempt to express faith; it is not itself the object of faith.

The controversy between Erasmus and Luther over belief and skepticism epitomizes the broader struggle between the Protestant reformers more generally and the Catholic theologians. The issue between them was what are the proper criteria for determining the truth of theological assertions. A critical background to this dispute was the Christian humanists' rediscovery of the ancient texts of the Pyrrhonists. The Catholic apologists of the Counter-Reformation used these skeptical arguments against the Protestants, particularly against the Calvinists in France. The Protestant Reformers had insisted that the criterion of authority is the Bible alone. But, in turn, Catholic scholars pointed to the uncertainties regarding the reliability of the received text of the Bible when compared with earlier Hebrew and Greek manuscripts. Furthermore, the Protestants could not themselves agree on the interpretation of crucial biblical passages. Why should Luther's, or Calvin's, or Thomas Müntzer's interpretation be preferred to that of the wisdom of the universal church itself?

It was from these sixteenth-century *theological* disputes over belief and unbelief that the later controversies on this subject in the eighteenth-century Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE) can be traced. This is perhaps best observed in the context of the writing of three key thinkers: Michel de Montaigne, Blaise Pascal (see PASCAL'S WAGER), and Pierre BAYLE. Montaigne ushered in *la crise Pyrrhonienne* of the seventeenth century and its aftermath. His *Apology for Raimond Sebond* (1580) became a famous Pyrrhonist text, and a key source not only of philosophical discussion but also in the Christian theological debates over skepticism and belief. Nominally the *Apology* is a defense of Raymond Sebond, a fifteenth-century Spanish defender of Aristotelian natural theology (see ARISTOTLE), insisting that Sebond's theological arguments are as good as those of most other men. The essay is, in fact, the expression of Montaigne's own Pyrrhonian crisis of religious belief. The conclusions he draws from his profuse reiteration of skeptical arguments for a suspension of judgment are, surprisingly, the arguments of many of his contemporary religious apologists. Montaigne's conclusion is a conservative and conformist response of skepticism in the service of traditional religion. "Since I am not capable of choosing," he wrote, "I take the choice of other men and keep myself in the station in which God has placed me." This often is referred to as Catholic Pyrrhonism.

Some critics contend that Montaigne's religious conformism is a pretense that conceals his true, radically irreligious skepticism. Others argue, rather, that Montaigne's words are spoken in good faith, though they see his conformist religion as "thin soup." Pascal was one who saw Montaigne's skepticism as undermining faith, and offered his own apology for religious certitude.

Pascal, the great mathematician, scientist, and Christian apologist, grew up in a family circle of philosophers that included Marin Mersenne, Thomas HOBBES, and Descartes. He was introduced to Pyrrhonean skepticism through his deep reading of Montaigne. After a dramatic conversion experience, Pascal repudiated both the God of the philosophers—epitomized in Descartes's philosophy—and Montaigne's skepticism. But he used this Pyrrhonistic skepticism in what proved to be an influential critique of the limits of scientific and philosophic knowledge. He sought to demonstrate that scientific and philosophic truth claims are dependent on axioms which cannot, themselves, be demonstrated. Science can falsify hypotheses but not establish them.

In his uncompleted Christian apologetic—published after his death as *Pensées* (Thoughts)—Pascal offers a highly complex argument that explores the relation of skepticism, probabilism, faith, and certitude. His conclusion is often referred to as an exemplification of *fideism*, the view that religion is based on faith alone. Although passages in the *Pensées* can support this view, Pascal's understanding of the relation of faith and reason is rather more subtle. He first seeks to refute both the dogmatism of a Descartes and the skepticism of a Montaigne, and then seeks an alternative way that defends Christian faith without appeals to philosophy (*intellectus*) *alone*. He does this by showing how experience and knowledge can assist in facilitating belief.

First Pascal begins with lengthy demonstrations of the Pyrrhonist proof regarding the uncertainty of our reasoning and the fact that truth is unattainable. What then? Pascal proceeds to show that a full Pyrrhonism has never existed and can never exist. Sounding like the later David HUME, he suggests that "Nature backs up helpless reason and stops it going so wildly astray." Furthermore, to remain in a state of radical doubt, the Pyrrhonist's quietude risks a moral enervation. Since man is a self-tran-

scendent creature, he is both an "imbecile worm . . . a sink of uncertainty and error," and a "prodigy," a "depository of all truth." This dual nature of human life—a strong Augustinian theme—is crucial to Pascal's argument. For the human heart, he insists, does not remain in a state of peaceful suspension of judgment. In man's search, he "strains to know what the true good is in order to pursue it."

This striving—natural to the human person—brings Pascal to his wager argument, an issue of considerable dispute. Reason's incapacity to either prove or to disprove the existence of God places a person in a position similar to one in a game of chance or the toss of a coin. Pascal argues that it is not irrational to bet on God's existence, since the odds are even, and "your reason is no more affronted by choosing one rather than the other." In Pascal's view, if one wagers that God does not exist, one gains little at best if one wins, but if one loses, one loses everything. These assumptions would not appear to be as self-evident to a modern unbeliever or agnostic facing the question of an afterlife.

But Pascal insists that, in such a circumstance wanting in proof, the wise and prudent man wagers that God exists, the reason being that the afterlife is, arguably, *not* the crux for Pascal: "Now what harm will come to you from choosing this course. . . . I tell you that you will gain even in this life, and that every step you take along this road . . . that in the end you will realize that you have wagered on something certain." Custom, sentiment (feelings), and reason are related here. "Our minds [*esprit*] and feelings [*sentiments*] are trained by the company we keep." For Pascal, all our reasoning comes down to surrendering to feeling (*sentiment*) by which he means the personal perception of first principles. How, then, does one distinguish sentiment from personal fancy? "Reason is available," he replies, "but can be bent in any direction. And so there is no [incorrigible] rule." Hence, "the will is *one* of the chief organs of belief, not because it *creates* belief, but because things are true or false according to the aspect by which we judge them." Faith, in this sense, is, for Pascal, not irrational, for it has justifying conditions. This is not proof, of course, for a demonstrable or justified knowledge is, itself, founded on a set of beliefs. As we will see, Pascal's views have some resonance with modern antifoundationalism.

In his *Historical and Critical Dictionary* (1697–1702), the Frenchman Pierre Bayle brought Pyrrhonian skepticism to its modern apex with his critique of all claims to knowledge in metaphysics, theology, and science. It is contested whether Bayle's skepticism ends in a radical fideism. But he clearly holds the belief that Christian claims cannot be known to be true by intellectual demonstration, but must be accepted by faith. Yet Bayle was not *simply* a skeptic; he was also a Christian philosopher deeply influenced by the reformer John Calvin and by his own travails as a minority Protestant Huguenot refugee who fled from persecution in his own Catholic France. Later in life he rejected dogmatism of every stripe—but remained a heterodox Christian, endowed with a radical sense of God's absolute transcendence. This religious radicalism is the source of his attack on all idolatry, whether theological, clerical, or political—and is the root of his influential defense of toleration. In his own searchings, Bayle rarely found that the whole truth is on one side. Naturally, he was attacked by Christian rationalists on the Left and Christian dogmatists on the Right. But his ruling passion was that of a theologian, as can be seen in his radical monotheistic skepticism about finite claims; in his belief that the rule of judgment lies in the conscience, not the intellect; and in his final recourse to divine revelation.

Bayle's thoroughgoing skepticism had two significant legacies. The eighteenth-century philosophes, especially VOLTAIRE, drew upon Bayle's striking criticisms of the church, the Bible, and theodicy (see EVIL, PROBLEM OF) to discredit Christianity itself, which was not Bayle's aim. In the nineteenth and twentieth centuries, further emboldened by Immanuel KANT's *Critique of Pure Reason* (1781) some Germanic philosophers and theologians were to follow Bayle in his radical metaphysical skepticism and in his emphasis on conscience and the rule of moral judgment.

The influence of Kant's philosophy on Christian (particularly Protestant) theology in the modern era has been profound. Put succinctly, in the preface to his *Critique of Pure Reason*, Kant "found it necessary to deny [empirical] knowledge in order to make room for [moral] faith." Kant, importantly, contrasted faith with empirical knowledge, not faith with reason. However, the first *Critique* had a decisive influence on the origins of modern religious AGNOSTICISM, subjectivism, and PRAGMATISM. Also, taking their lead from Kant's *Critique of Practical Reason* (1788) in the nineteenth century, a number of neo-Kantian Protestant theologians opposed metaphysics and sought to free Christianity from both scientific and metaphysical knowledge and justification, as well as from confessional orthodoxy, and to ground Christianity in a faith-based moral freedom. In this it was a harbinger of twentieth-century Christian EXISTENTIALISM.

Between the 1780s and 1850s there also emerged a protest against the Enlightenment's trust in autonomous reason and its optimistic anthropology. This Counter-Enlightenment included thinkers such as J. G. Hamann and Søren Kierkegaard. Hamann, a friend and critic of Kant, had a considerable influence on Kierkegaard. Many of the latter's themes are found in Hamann in an embryonic form. Hamann perceived Christianity as profoundly opposed to Enlightenment RATIONALISM, and he called upon the skepticism of Socrates to oppose the philosophes' optimistic certainties—what he called their "philosophical idolatry." Hume played a large role in Hamann's appeal to "natural belief." In his *Socratic Memorabilia* (1759) he wrote: "Our own being and the existence of all things outside us must be believed and

cannot be established in any other way." This opens the way to an active faith.

Faith, for Hamann, does not appear to be a "blind" faith, since experience and faith are dialectically related. One needs the other, since God cannot be known by discursive reason alone. For Hamann, God is perceived through our senses: in nature, in history, and in scripture. These senuous signs and images are particulars that deeply resonate in our experience. Hamann does, however, embrace a form of fideism, for while truth "must be dug out of the ground," only those illuminated by grace appear to have "the eyes to see and ears to hear." Hamann's eagerness to confound the rationalists with his skepticism may well have only darkened God's revelatory signs for others.

During the nineteenth century the encounter between Christianity and unbelief takes on a special significance, since much radical unbelief came from within Christianity itself in efforts to "demystify" the faith. David Friedrich STRAUSS, Ludwig FEUERBACH, and Friedrich NIETZSCHE—to note only a few—were either the sons of Lutheran pastors or began their careers as theological students. While their "hermeneutics of suspicion" was, for many, compelling, a number of modern Christian thinkers also recognized in their bold critiques a necessary corrective, a cleansing of a sterile orthodoxy or denunciation of the accommodation of Christianity to a bourgeois culture.

The Danish philosopher Søren Kierkegaard sought to disengage Christianity from its dependence on modern rationalism—in the forms of a Kantian and Hegelian attempt both cancel out and yet preserve Christian faith at a higher level. What Kierkegaard called his "project of thought" regarding reason and faith is undertaken in two of his pseudonymous philosophical works, the *Philosophical Fragments* (1844) and the *Concluding Unscientific Postscript* (1846).

The earlier work concludes that eternal happiness cannot be based on historical knowledge alone, for history is the realm of the relative and the probable. Hence, from the historical point of view, the Christian claim that the Eternal entered time is absurd. This "Christian paradox" can only be appropriated by faith, for religious truth is not acquired in the same way one obtains information; rather, only in "that infinite, personal, impassioned interestedness which is the condition of faith"—the central theme of the *Postscript*. Kierkegaard insists that Christian faith entails a double or absolute paradox, in that the learner is not only *given* the truth by the teacher but also the *capacity* to apprehend it.

Critics contend that Kierkegaard's "leap of faith" to the religious stage involves a renunciation of any intelligible choice; other scholars deny that he is an irrationalist. They contend that for Kierkegaard—as later for the Catholic theologian John Henry Newman—coming to faith or belief is analogous to a radical reenvisionment of the world, or to a moral transformation. These involve a convergence of factors which, together, reach a "critical threshold," one that results in a qualitative change in perspective. Such a process is experienced as both compelled and yet a free act.

In nineteenth-century Britain theological skepticism and unbelief proceeded from the rather tardy discovery of Kant's critical philosophy. A crucial source was the Scottish philosopher William Hamilton's *On the Philosophy of the Unconditioned* (1852). According to Hamilton's reading of Kant, the mind can only know the "conditionally limited," not the Infinite or Absolute, which "can be conceived by thinking away from, or an abstraction of, those very conditions under which thought is realized." "A God understood," he declared, "would be no God at all; to think that God is, as we can think him to be, is blasphemy." The idea of the Unconditioned or Infinite is, then, only negative. Hamilton's "learned ignorance" reintroduced into theology the idea of the *via negativa*, and what became popularly known in Britain as the Agnostic Controversy.

H. L. Mansel, professor of philosophy at Oxford and afterward dean of Saint Paul's in London, applied Hamilton's doctrine to the problems of a Christian knowledge of God in his *The Limits of Religious Thought* (1859). For Mansel, such a Christian philosophy "checks the pride of reason," reminding us "that there are truths which we cannot see." Mansel argued that our conceptions of God, for example, in the Bible, may be *speculatively* false and yet *regulatively* true, and that "regulative truth is our human guide to practice." Herbert SPENCER's *First Principles* (1862) carried further Hamilton's and Mansel's doctrine with his own concept of the Unknowable. Spencer's massive twelve-volume *Principles* became the "Bible of Agnosticism," and his incredible popularity attracted a group of clergy who adopted the name "Christian Agnostics." They praised Spencer for purifying the concept of God by removing all kinds of anthropomorphic encumbrances.

It was not only the liberal and heterodox Christian clerics and laity who spoke of the value of this agnostic temper of mind. The Jesuit theologian George Tyrrell was severe in his critique of theology's rash overconfidence. He urged that theology "be judged by a moral rather than an intellectual criterion." And the influential Roman Catholic writer Friedrich von Hügel confessed that we are all "such Agnostics in our better moments," since this quality of mind is "but a sense of mystery, the consciousness of how much greater is the world of reality . . . than is, can be, our clear, definable analysis and theory of it." What now was urged by noted philosophers, such as James Ward, Henry Sidgwick, and William James, was the moral right to "stake belief" on a live hypothesis and to test that belief in experience.

In the twentieth century a variety of philosophical critiques of religious belief prompted responses from Christian thinkers. In the first half of the century Existentialism attacked the then-influential scientific and

philosophical POSITIVISM, associated, for example, with the Vienna Circle (see SCHLICK, MORITZ, AND THE VIENNA CIRCLE). Christian existentialist themes are prominent in the writings of the young Karl Barth, Paul Tillich, and Nikolai Berdyaev. Critical to these and other Christian writers of the time were Pascal, Kierkegaard, Nietzsche, and Dostoyevsky, all of whom were concerned with the depersonalization of the individual, human alienation, and inauthenticity. These writers emphasized human finitude and doubt and insisted that this element of human uncertainty cannot be removed, yet it demands the risk of courageous action. Tillich famously asserted that such an existential act of faith is the religious state of being "ultimately concerned," and that "doubt is a necessary element in it."

By 1950 the British school of linguistic analysis was philosophically dominant, and posed both new challenges to Christian faith and called forth new defenses of religious belief. There were numerous efforts to "demythologize" the antique language and worldview of the Bible. One response of Christian philosophers was to reject the older theological realism as not essential to Christianity's basic message, which is the moral resolution to live an "agapistic" way of life. This did not require foregoing certain traditional Christian spiritual practices, since they enhance this form of life. Other Christian thinkers, influenced by the later writings of the philosopher Ludwig WITTGENSTEIN, argue that the realist, or older supernatural, account of Christian faith is not the authentic account of that faith. An example is D. Z. Phillips, who cites certain New Testament texts describing belief in eternal life: "The immorality of the soul . . . refers to a person's relation to the self-effacement and love of others in dying to the self." This dying and life in Christ is itself the overcoming of the threat of death.

The challenge of analytical philosophy was also met by theological realists. One example is the work of the American philosopher Alvin Plantinga, whose aim is a critique of the assumptions of foundationalism. That is the doctrine that contends that for a belief to be rational, it must either be basic or be justified by other basic beliefs, such as self-evident propositions and incorrigible propositions that are recognized to be true by merely understanding them. While these may claim to be self-evident, Plantinga argues that such commitments are not capable of being proven incorrigible. Nor is the foundationalist justified in holding that other beliefs are not properly basic. Plantinga proceeds to argue that belief in God, that is to say biblical monotheism, is a proper basic belief: that is, it can offer reasonable warrants without basing the belief on other self-evident beliefs.

What is instructive about these recent and centuries-old dialogues over belief and unbelief is that they have not been simply intramural but, rather, have engaged secular thought from Greek skepticism to present currents in philosophy. And this, in large measure, is due to the fact that Christianity is itself a developing and multifarious historical phenomenon that resists efforts to define too simply what constitutes its essential features.

JAMES C. LIVINGSTON

CHUBB, THOMAS (1679–1747), influential English deist and rationalist. Thomas Chubb was born on September 29, 1679, in East Harnham, Wiltshire, England, the son of a humble tradesman. He worked as a glover until his eyesight became too poor, when he became a candle maker. Like many tradesmen who worked with their hands, Chubb's mind was free to ponder the questions of the day, and he devoted his life to the question of religion.

Chubb was not an original thinker, but his incisive mind and clear writing helped make deist thinking (see DEISM) accessible to others like him. He represented the rationalist wing of English Enlightenment thought (see RATIONALISM). Chubb believed that knowledge of God and Creation was open to all open-minded scholars, and that the consistent study of origins would help reveal deep truths. His first book, *The Supremacy of the Father Asserted* (1715), was a criticism of the Trinity. This endeared Chubb to the Unitarians (see UNITARIANISM TO 1961), and for several years he lived in London and associated with them. He eventually returned to Wiltshire, where he resumed work as a candle maker. He also wrote *The Previous Question with Regard to Religion* (1725), which won praise from VOLTAIRE, and *A Discourse concerning Reason* (1733), which argued that REASON is the only guide one should need in religious matters. Any religious urging not based in reason, Chubb argued, is bound to lead to superstition or fanaticism. In *The True Gospel of Jesus Christ Asserted* and *A Short Dissertation on Providence* (both 1738), Chubb reiterated the deist arguments against a personal, interventionist God. The testimony of revelation, upon which claims of intervention rely, cannot reasonably be expected to convince people not already part of that faith tradition, Chubb argued. And in *A Discourse on Miracles* (1741) Chubb

anticipated the better-known arguments of Conyers MIDDLETON and David HUME. And Chubb also argued strongly that people are perfectly able to lead moral, responsible lives without the support of supposedly divine revelation.

Chubb escaped the persecution suffered by some of his contemporaries, Thomas WOOLSTON in particular. Instead, his orthodox opponents resorted mainly to ridicule to diminish his reputation. Because he was entirely self-taught, his works had some relatively minor weaknesses, which his enemies latched on to. But among the large number of skilled artisans among whom Chubb lived his life, his works were influential. Thomas Chubb died on February 8, 1747, in Salisbury, Wiltshire.

BILL COOKE

CHURCH, STATE, AND RELIGIOUS FREEDOM. Many religious believers and nonbelievers alike agree that separation of church and state—the idea that the government should not fund, promote, or advocate religion—is the only mechanism through which governments can maintain complete religious and philosophical freedom for diverse groups of citizens.

The separation of church and state in the United States came about thanks to the pioneering vision of a small band of Enlightenment thinkers, religious skeptics, and dissenting clergy. It was a radical idea when it was first proposed in colonial America and is not universally appreciated even today.

For centuries, the prevailing belief in the Western world was that neither church nor state could survive without mutual support. This idea was reinforced after pagan Rome became an officially Christian empire. It survived through the Byzantine era and into the Middle Ages, a period of state-established churches and often widespread religious persecution.

Even in the Middle Ages, when the all-consuming power of the Roman Catholic Church dominated religious life, some critics challenged conventional wisdom and asserted that government had no right to control religious affairs or vice versa. It wasn't until after the Protestant Reformation that the idea began to take hold—and even then, many advocates simply wanted Catholicism disestablished in favor of some other sect.

The experience of the American colonies led some forward thinkers to reassess the wisdom of merging religion and government. In Massachusetts, Puritans established a harsh theocracy that brooked no dissent over religious matters. Roger WILLIAMS, a Puritan preacher, challenged that view. Williams's views were deemed heretical, and he was forced to flee the region. He purchased land from the natives and founded his own settlement, Providence.

Williams was especially troubled by the persecution spawned by unions of church and state. Forced religious worship, he once wrote, "stinks in God's nostrils." In his book *The Bloudy Tenet of Persecution for Cause of Conscience*, Williams railed against state-sponsored religious persecution. Wrote Williams, "I must profess, while Heaven and Earth lasts, that no one Tenet that either London, England, or the World doth harbor, is so heretical, blasphemous, seditious, and dangerous to the corporal, to the spiritual, to the present, to the Eternal Good of Man, as the bloudy Tenet . . . of persecution for the cause of Conscience."

In *The Bloudy Tenet*, Williams spoke of the dangers of opening a "gap in the hedge, or wall of separation, between the garden of the church and the wilderness of the world." The use of the phrase is interesting, as it is very close to Thomas Jefferson's metaphor of a "wall of separation between church and state." However, there is no evidence that Jefferson knew of Williams's writings.

Williams's Rhode Island colony respected complete religious freedom. Even members of sects that Williams personally disliked, such as Quakers, found a haven there. But as other colonies were settled, different types of church-state arrangements emerged.

Generally speaking, northeastern colonies were the most repressive. The Puritan Church was established by law, and everyone had to pay taxes to support it—whether they were members of the church or not.

Middle colonies such as Pennsylvania and Maryland were a little more tolerant on religious liberty matters. William Penn allowed anyone who believed in one God to settle in Pennsylvania, although Sunday religious observances were mandated by law. Maryland was founded as a haven for Catholics. The colony's Toleration Act of 1649 extended religious freedom to all Christians. The concept of toleration at this time was not generally understood to include non-Christians or nonbelievers.

Southern colonies tended to be more repressive. Many of them officially established Anglicanism as the state faith and imposed church taxes on all citizens.

Virginia maintained strict laws concerning religious beliefs and worship. Failure to attend church was a crime. Parents who did not baptize their children could be imprisoned, and denying the existence of the Trinity was punishable by a three-year prison term.

Despite these harsh laws, it was the issue of church taxes that outraged many Virginians. Their protest over mandatory financial support for religion was to have national implications and help shape the separation of church and state and bring true religious freedom to the new nation.

The Virginia Protest. By the mid-1700s, Anglicanism was a minority faith in Virginia—yet all residents had to pay for its upkeep. Farmers were required to make in-kind contributions, in some cases being forced to donate crops and farm animals to the local Anglican minister.

In the 1760s, authorities cracked down on efforts by dissenting clergy to spread their views, going so far as to imprison some Baptists. In 1774 James MADISON noted that several Baptist clergy had been placed in jail for preaching on the streets. He was incensed, and, with great passion, wrote to a friend in Philadelphia about the incident. "That diabolical, hell-conceived principle of persecution rages among some and to their eternal infamy, the clergy can furnish their quota of imps for such business," wrote Madison. "This vexes me the worst of anything whatever."

During the Revolution, Madison worked to help shape Virginia's new government. Appointed to a Committee on Religion, he joined forces with Thomas JEFFERSON on a proposal to disestablish the Anglican Church in Virginia. The move turned out to be premature and garnered little support, but Madison and Jefferson had laid the groundwork for a battle they would eventually win.

After the Revolution, in 1784, Madison, then a member of the House of Delegates, led the opposition to a bill by Patrick Henry that would have imposed a tax on all Virginians to pay for "teachers of the Christian religion."

Henry's bill would have required all state residents to pay "a moderate tax or contribution annually for the support of the Christian religion, or of some Christian church, denomination or communion of Christians, or for some form of Christian worship."

In some respects, Henry's measure was less offensive than forced taxation for a state-established church. Under the Henry model, Virginia residents would have at least had the right to choose among competing Christian denominations.

But that made little difference to Madison. He was able to see that state-supported religion was wrong whether one church was favored or fifteen were. Madison called the Henry proposal "obnoxious" and began working with Baptist and other religious leaders to seal its fate.

To defeat the Henry bill, Madison penned one of the greatest statements of religious liberty ever crafted. The "Memorial and Remonstrance against Religious Assessments" is a list of fifteen reasons why no one should be forced to pay taxes to support religion. In language that still vibrates with relevance today, Madison demolished the assumption that religion needs the prop of the state to survive.

Copies of the "Memorial and Remonstrance" circulated throughout Virginia. When the general assembly reconvened in the fall of 1785, lawmakers were confronted with stacks of petitions against the Henry measure signed by Virginians throughout the state. Henry himself had been elected governor, making it impossible for him to speak on behalf of the measure from the floor. The proposal was soundly defeated.

But Madison did not stop there. Seizing on the momentum generated by the defeat of the Henry bill, he pushed for passage of Jefferson's 1779 Bill for Establishing Religious Freedom. The measure stated bluntly, "[N]o man shall be compelled to frequent or support any religious worship, place or ministry whatsoever."

The bill also took a strong stand against church taxes, calling it "sinful and tyrannical to compel a man to furnish contributions for the propagation of opinions which he disbelieves and abhors."

Thanks in a large part to Madison's lobbying, the Virginia Assembly passed the bill by a vote of 60–27 in January 1786. Jefferson, who was in Paris at the time, rejoiced. He was especially pleased that efforts to confine the bill's scope to Christians only were defeated. This was proper, Jefferson later wrote, as he intended the bill to protect "the Jew and the Gentile, the Christian and Mahometan, the Hindoo, the infidel of every denomination."

Development of the First Amendment. The Virginia experience had a profound impact on the development of the First Amendment in 1789. Madison, chief author of the Constitution, played a key role in the development of the Bill of Rights.

The Constitution as originally written is mostly silent on religion—with one notable exception: Article VI bans "religious tests" for public office. This is significant because it says a lot about the mind-set of the framers. In colonial America, religious qualifications for public office were common. Those aspiring to hold public office, for example, usually had to be Trinitarian Protestants or state that they believed in a future state of rewards and punishments (i.e., heaven and hell). Thus, high office was limited not only to Christians but to certain types of Christians. That the US Constitution banned such religious qualifications for federal office marked an important step forward.

The Constitution is also notable for what it does *not* say about religion. Except for the pro forma usage of "in the year of our Lord" in the date, there is no mention of God, Jesus Christ, or Christianity in the body of the document. This omission was deliberate, and it did not sit well with some. During the Constitutional Convention, a minority faction argued in favor of recognizing Christianity in the document. Their views failed to carry the day.

After much debate, discussion, and revision, the First Amendment emerged in a form that encapsulates the separation of church and state in two ways: The religion clauses read, "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof."

The first part of the provision is often called the Establishment Clause because it bars government from "establishing" a religion. By *establishment* the framers meant

more than merely setting up an official church. Drafts of the First Amendment that would have done only that were considered and rejected as too weak. To the framers, laws funding, promoting, or furthering religion were "establishing" it.

The second half, which bars laws prohibiting the free exercise of religion, is often called the Free Exercise Clause. The wording here is broad, and the phrase has been interpreted to mean that government may not unduly interfere with the religious freedom rights of the people.

The religion clauses are only sixteen words long. Given their brevity, a certain amount of interpretation would be necessary over the years. In recent times, this has been the job of the Supreme Court.

What about the phrase "separation of church and state"? Where does it come from? What does it mean?

Jefferson's Famous Letter. Both Jefferson and Madison used the term "separation" to describe the proper relationship between church and state. Madison spoke of how the "total separation of the church from the state" had increased interest in religion in Virginia. He also observed that separation between religion and government is "strongly guarded" in the Bill of Rights.

But it was Jefferson's famous January 1, 1802, letter to the Danbury, Connecticut, Baptists that gave the metaphor of a wall of separation between church and state great currency.

Jefferson was not an orthodox Christian, but his advocacy of complete religious freedom was well known and admired by many Americans—especially those who had to live under state-sponsored religions. At the time the Bill of Rights was adopted, its provisions applied only to Congress. States were thus free to maintain established churches, and many did so.

Connecticut had established the old Puritan Church, Congregationalism. Although laws in Connecticut supposedly made it possible for dissenters to opt out of the church tax scheme, in reality this provision was ignored or interpreted in such a way that opt-outs were rarely granted. In other cases, the mechanism to get an opt-out—one had to appear before a government official and publicly declare his religion—was deemed offensive by dissenters.

Baptist leaders in Danbury wrote to Jefferson to express their dissatisfaction with this system. Though religiously conservative, the Baptists knew of Jefferson's support for religious liberty and hoped that his election as president in 1800 would free them from the oppressive Connecticut system.

The Baptists wrote to express their hope that Jefferson's view on religious freedom "like the radiant beams of the Sun, will shine and prevail through all these States and all the world till Hierarchy and Tyranny be destroyed from the Earth."

In his reply, Jefferson thanked the Baptists for their warm thoughts and went on to assert, "Believing with you that religion is a matter which lies solely between man and God, that he owes account to none other for his faith or his worship, that the legitimate powers of government reach actions only, and not opinions, I contemplate with sovereign reverence that act of the whole American people which declared that their legislature should 'make no law respecting an establishment of religion, or prohibiting the free exercise thereof,' thus building a wall of separation between Church & State."

As president Jefferson put his separationist philosophy into action. He even refused to issue proclamations calling for days of fasting and prayer. Madison, who followed Jefferson into the White House, was even firmer on maintaining the church-state wall. He vetoed bills giving surplus federal land to a church and granting a congressional incorporation to a church in Washington, DC, that would have charged it with the task of caring of the indigent.

Madison proclaimed days of prayer and fasting under pressure from Congress during the War of 1812, but later in his life wrote that he regretted having done so and even concluded that his actions had violated the First Amendment. Madison also opposed taxpayer-funded chaplains in Congress and in the military, and once blocked a proposed census that planned to classify Americans by occupation, asserting that questioning clergy would violate the First Amendment.

Because the Bill of Rights was originally limited to Congress, church-state cases were rare in the federal courts for many years. That changed after the Civil War, when Congress passed the Fourteenth Amendment. Among other things, this amendment was designed to impose portions of the Bill of Rights on the states, a process called incorporation.

Although the language of the Fourteenth Amendment is clear, extremely conservative Supreme Courts in the late nineteenth century refused to interpret the amendment in a manner that recognized incorporation. By 1920 the high court finally began adopting the incorporation doctrine with regard to free speech and press. In 1940 the Court more fully embraced incorporation in the landmark church-state case *Cantwell v. Connecticut*.

The Supreme Court's acceptance of incorporation led to a flood of cases in the federal courts. Many of these reached the Supreme Court, leading to a line of church-state cases that have shaped the law we know today.

Key Church-State Cases. Cases dealing with the Establishment Clause fall into several broad areas: religion in public education, taxpayer funding of religion, and government endorsement of religion. Leading church-state cases in Establishment Clause jurisprudence include:

- *Cochran v. Louisiana State Board of Education* (1930): Upheld a state textbook loan program that included religious schools.
- *Everson v. Board of Education* (1947): Upheld state law providing free bus transportation to private religious school students.

- *McCollum v. Board of Education* (1948): Banned voluntary religious instruction run by outside groups on public school grounds (see McCollum, Vashti).
- *Zorach v. Clauson* (1952): Approved voluntary religious instruction off site during the public school day, a plan called "released time."
- *McGowan v. Maryland* (1961): Ruled constitutional state laws curbing commercial activity on Sundays, also known as blue laws.
- *Engel v. Vitale* (1962): Struck down mandatory school-sponsored prayer in public schools.
- *Abington Township School District v. Schempp* (1963): Banned mandatory school-sponsored Bible reading in public schools.
- *Epperson v. Arkansas* (1968): Struck down an Arkansas state law that banned the teaching of evolution in public schools.
- *Lemon v. Kurtzman* (1971): Struck down state laws that offered tax funding to pay for salaries at religious schools.
- *Torcaso v. Watkins* (1971): Struck down state provisions barring nonbelievers from holding public office.
- *Walz v. Tax Commission of the City of New York* (1971): Declared that laws giving tax exemption to religious groups are not a violation of church-state separation and that such exemptions are a right granted by statute, not the Constitution.
- *Mueller v. Allen* (1983): Upheld a Minnesota law giving tuition tax deductions for parochial- and private-school parents.
- *Marsh v. Chambers* (1983): Upheld use of taxpayer-funded legislative chaplains.
- *Lynch v. Donnelly* (1984): Upheld inclusion of religious symbols in a government display that also included secular symbols.
- *Wallace v. Jaffree* (1984): Declared state laws mandating "moments of silence" for prayer in public schools unconstitutional.
- *Edwards v. Aguillard* (1987): Struck down state laws requiring balanced treatment between evolution and creationism.
- *County of Allegheny v. ACLU* (1988): Struck down government display of religious symbols standing alone.
- *Board of Education of Westside Community Schools v. Mergens* (1990): Upheld voluntary "equal access" religious clubs run by students at public high schools.
- *Lee v. Weisman* (1992): Struck down public school-sponsored graduation prayer.
- *Santa Fe Independent School District v. Doe* (2000): Struck down school-sponsored prayers before public school sporting events.
- *Zelman v. Simmons-Harris* (2002): Upheld an Ohio law giving vouchers to private religious school students.
- *Locke v. Davey* (2004): Upheld a state constitutional provision barring tuition assistance to students studying to become pastors.

Leading Free Exercise Clause cases include:

- *Watson v. Jones* (1872): Held that secular courts have no right to meddle in internal church affairs to resolve conflicts.
- *Reynolds v. United States* (1879): Permitted states to ban polygamy, holding that its practice has always been illegal in Western societies.
- *Cantwell v. Connecticut* (1940): Struck down a state law requiring religious groups to gain permission from local authorities before proselytizing in public.
- *West Virginia State Board of Education v. Barnette* (1943): Struck down a state law allowing public schools to expel children for refusing to recite the Pledge of Allegiance.
- *United States v. Ballard* (1944): Stated that in cases of fraud allegations against religious groups, the only standard that may be applied is whether actual illegal forms of fraud occurred, not the content of the religious beliefs in question.
- *Prince v. Massachusetts* (1944): Held that state laws curbing child labor could be applied to religious groups that required children to distribute literature door to door.
- *Wisconsin v. Yoder* (1972): Upheld a state law permitting members of the Amish to withdraw their children from schools after the eighth grade.
- *Employment Division v. Smith* (1990): Held that the state is not required to show "compelling state interest" when passing laws that might infringe on religious liberty, only that such laws must be neutral and generally applicable and not intended to single out religion.
- *Church of the Lukumi Babalu Aye v. City of Hialeah* (1993): Struck down a Florida community's ordinance banning animal sacrifice, holding it was aimed at religion.

Current Threats to US Church-State Separation. Today church-state separation in the United States stands at a crossroads. In the 1980s President Ronald W. Reagan made a number of appointments to the US Supreme Court and lower federal courts who held views less favorable or even hostile to church-state separation. These appointments led to a reversal at the high court on the question of taxpayer funding of religion. The Court is moving close to adopting the view that government aid to religion is acceptable as long as it is offered in an evenhanded manner.

The 1980s also saw the rise of the Religious Right as a political force. Led by fundamentalist ministers like Jerry Falwell, Pat Robertson, and D. James Kennedy, the Religious Right is openly hostile to church-state separa-

tion. Its leaders often proclaim that separation of church and state is not in the US Constitution and insist that the country was founded to be a "Christian nation."

The Religious Right holds great power within the Republican Party in the United States. Some of its goals include banning all abortions, rolling back gay rights, restoring mandatory Christian worship to public schools, watering down or banning the teaching of evolution in public schools, censoring material in public libraries, curbing erotically tinged forms of entertainment, and erecting religious displays such as Ten Commandments markers and crosses in courthouses and other government buildings. As much as possible, the Religious Right would like the US government to embrace its theocratic vision and lower the church-state wall to the point where the First Amendment's religion clauses would be interpreted as banning only the creation of an official, state-run church.

Shortly after taking office in 2001, President George W. Bush unveiled a faith-based initiative that would funnel money to houses of worship to pay for various social service programs such as drug and alcohol addiction treatment, job training, soup kitchens, and homeless shelters.

Bush and his advisers have insisted that religious groups should be able to accept taxpayer funding and still include religious content in their programs and restrict hiring on religious grounds—even if those positions are paid for with public funds.

Many advocates of church-state separation believe the faith-based initiative is a form of church tax and note with irony that more than two hundred years after Madison wrote the "Memorial and Remonstrance against Religious Assessments," the nation seems prepared to debate the issue anew.

CICERO, MARCUS TULLIUS (106–43 BCE), Roman philosopher. Cicero was one of the great humanists of history (see HUMANISM). VOLTAIRE said that Cicero "taught us to think." Pliny wrote that Julius Caesar, Cicero's adversary for much of his life, said that it was better to have pushed back the frontiers of the mind as Cicero did than to have pushed back the frontiers of the empire as he, Caesar, did. Cicero ranks as one of the great orators of history, and his correspondence and writings are keys to understanding the political, social, literary, and economic life of late Republican Rome.

Well educated in Rome and in Greece, Cicero was a dominant figure in Roman courts and politics. He was deeply involved in the conspiracies and struggles of the late Roman Republic; for a time he was exiled from Rome. During the civil war that led to the collapse of the Roman Republic, he was involved both for and against Julius Ceasar, Gnaeus Pompey, Marcus Crassus, Mark Antony, and Octavian (later known as Augustus) in his efforts to save the republic, an effort in which he was unsuccessful. He was executed by Octavian in Rome in December 43 BCE.

Cicero was a prolific writer, though much of his writing has been lost. Approximately nine hundred of his letters survive, fifty-eight of his *Orationes* (some incomplete), several of his rhetorical works, some of his poetry, and several of his dialogues on philosophy. He molded the Latin language and deeply influenced the Papal Chancery, for which Latin would remain a living language to the present day. So great was Cicero's influence on Latin that in the first part of the sixteenth century, ERASMUS felt a need to challenge some of his terms and substitute more up-to-date terms rather than to continue the use of pagan constructions.

In his younger days, Cicero studied under a variey of teachers, mainly in Greece: the Epicurean Phaedrus (see EPICURUS), the Stoic Diodatus (see STOICISM), and the Academic (follower of PLATO) Philo of Larissa, who held that certainity was unobtainable and that probability was the only guide. Cicero rejected the Epicurean viewpoint but was greatly influenced by the other two. He did not study with the Peripatetics (followers of ARISTOTLE), but he was influenced by them. He called himself an Academic since he preferred to be guided by probability rather than to allege certainty. In ethics, however, he was somewhat of a dogmatist because he tended to accept some presumptuous statements without a sufficient rational background, although even here he operated on Stoic principles where virtue alone is the only good. Still he tempered this with a Socratic ideal that the key was knowledge. In religion he was an agnostic through most of his life, although he apparently underwent a religious experience in connection with the death of his daughter. He wrote on such things as pleasure, virtue, death, evil, and similar topics, and much research has been devoted to finding his sources. He relied on the four schools of philosophy for his guide. He used the dialogue form but his model was more Aristotelian than Socratic. He usually started by stating an Epicurean view of a topic followed by a Stoic view, both of which were expounded and criticized.

He then concluded with views held in common by the Academics (Platonists) and the Peripatetics (Aristotelians).

Cicero is extremely important in the history of philosophy for his transmission of Greek ideas and thinking. In a sense he can be labeled a humanist no matter how one defines humanism. He is still worth reading for his own thinking which has had tremendous influence on Western thought.

VERN L. BULLOUGH

CIORAN, EMIL M. (1911–1995), Romanian-born nihilist philosopher, essayist, and aphorist. Emil M. Cioran is undoubtedly the most consistent, comprehensive, and provocative philosophical nihilist of the twentieth century (see NIHILISM). For him, the world and human existence are without meaning, purpose, or value. In eight books, he maintains a sustained, withering negativity that is absolute and all-encompassing, condemning all belief systems, civilizations, religions, philosophies, art, reason, language, and himself.

Early Life. Cioran's father, Emilian, was a Greek Orthodox priest, and it is perhaps the potent influence of religion in his youth that led to his vehement condemnation of it later. Cioran studied philosophy at the University of Bucharest, graduating in 1928 with a thesis on Henri BERGSON. By the time he published *On the Heights of Despair* (1934), it is clear that he had rejected his father's religion and traditional philosophy, too. The strength of this first book allowed Cioran to study in Berlin from 1933 to 1935, and a French Institute fellowship in 1937 sent him to Paris, where he spent the rest of his life. After 1944 Cioran wrote exclusively in French.

Nihilist. Because of Cioran's nihilism, his aphoristic style, and his sometimes shrill tone, he is often inappropriately compared to the Friedrich NIETZSCHE of *The Will to Power*. However, whereas Nietzsche tried fiercely to overcome nihilism, Cioran's lifelong drive was focused on nurturing and declaiming nihilism. He offered no cure, no program, no hope; rather, he was adamantly committed to exposing all illusions that constitute the thin veneer of meaning to which the deluded cling. And he had a voracious appetite for hopelessness, endeavoring to leave readers fully disillusioned while confirming their worst existential fears. Accordingly, Cioran cannot be compared to the existentialists (see EXISTENTIALISM), whose ideas and methodologies represent a desperate effort to bring meaning to a world rendered meaningless by the corrosive effects of nihilism.

Cioran's first book in French, *A Short History of Decay* (1949), while critically celebrated, did not sell well. The book is useful for understanding Cioran's oeuvre because it not only reflects the existential issues expressed in earlier works but also sets the agenda for the five books that follow. Like all of his writings, this book is something between literature and philosophy. And like Cioran's other works, the prose is dense and sometimes paradoxical, zigzagging from one tersely phrased statement of opinion to another in an original and elegant style.

In *A Short History of Decay*, Cioran examines the history of nihilism's unfolding in Western civilization from its beginnings to the present, concludes that civilization is nearing its end, and expresses his relief. Cioran's essays also highlight his grimly pessimistic views on human existence. Any analysis of history, he writes, must begin with the equation that "existence equals suffering." The disaster of man begins at birth: "What sin have you committed to be born, what crime to exist?" History is a gloomy record of man's futile rage for order and the inexorable process of decay, a process that, he notes repeatedly, has been accelerated by the intolerance and absurdities of religion. At its core, human existence is endless suffering, grief, and depravation in a world where "everything conspires, elements and action alike, to harm you." Life, in short, is a "euphemism for Evil": "Of all that was attempted this side of nothingness, is anything more pathetic than this world, except for the idea which conceived it? Wherever something breathes there is one more infirmity: no palpitation which fails to confirm the disadvantage of being; the flesh horrifies me: these men, these women, offal that moans by the grace of certain spasms."

The catastrophe of existence, exacerbated by the nightmare of consciousness, requires human beings to hide from themselves, from others, and from reality. Regardless of the amassed evidence of history, then, most refuse to acknowledge that life is evil. And no wonder, declares Cioran; to admit to what *is*, is the equivalent of existential evisceration.

With this in mind, three options are available for coming to terms with our hideous existence: hope, resignation, or suicide. Cioran was obsessed with suicide most of his life, and he admired those who could kill themselves. For him, though, just the thought of suicide was a solace, he claimed, knowing that at any time he could escape to nothingness. Hope is a malicious lie, and those who wish for and expect fulfillment must be watched diligently because they are the source of fanaticism, insanity, and murderous violence. In his musings, Cioran seems to vacillate between resigning himself to nihilism in an epicurean debauch of "morphine, masturbation, or rum" or embracing a contemplative STOICISM: "Arm yourself in disdain, isolate yourself in a fortress of disgust." The danger of any form of resignation, however, is apathy because it produces ennui, which is the most unnerving experience of all.

Given Cioran's vituperative condemnation of nearly everything, his long life of eighty-three years seems contradictory, as does his aversion to absolutes of any form

except his own. (This, of course, is the paradox of nihilism.) And in spite of his lifelong effort to appear indifferent to existential absurdity, it clearly must have disturbed him. He fought an ongoing struggle with depression; and an undertone of world-weariness, sadism, and masochism permeates his writings. Cioran's last book, *Anathemas and Admirations* (1987), is a revealing blend of "anathemas" that continues his bout with human folly and the horrors of the world juxtaposed with something new and positive, and "admirations," his warm recollections of Samuel Beckett, Jorge Luis Borges, F. Scott Fitzgerald, and others. Perhaps understanding even the futility of this, Cioran stopped writing completely after this book. During the 1990s he suffered from Alzheimer's disease, and he died in Paris in 1995.

Limited critical attention, both praise and blame, and the less-than-enthusiastic reception of his work by the reading public should not undermine Cioran's position as an important literary figure and thinker. Instead, these facts serve to underscore the caustic power of his penetrating but painful insights. And although the uninitiated and the life loving might be unsympathetic to Cioran's grim cynicism, fellow travelers and those with a well-developed sense of humor will find his ideas compelling in their sheer unmitigated negativity.

CIRCUMCISION (AND ITS OPPOSITION) AS CAUSES. Circumcision and noncircumcision causes manifest themselves in widely varied forms, ranging from religious promotion, renunciation, and persecution to medicalization, spousal revenge, prohibition, and opposition to forced genital cutting in general. The continuum of pro- and anticircumcision activism can be viewed as a struggle between *evangelism* and *preservationism.* Evangelists for circumcision are very few in number, mostly clergy and physicians; these are unwittingly assisted by millions of followers who have chosen to accept evangelists' claims that circumcision is beneficial while ignoring the lack of supportive evidence to substantiate those claims. Preservationism, which aims to preserve the genitalia intact against surgical alteration, is a grassroots movement that believes all humans have a right to self-determination that includes a right to bodily integrity. Though circumcision is sometimes rationalized on religious grounds, FREETHOUGHT and humanist activists have not been conspicuous among its opponents, at least where male circumcision is concerned.

Ritual and cultural male infant circumcision has gone largely unchallenged by freethinkers, atheists (see ATHEISM), and humanists (see HUMANISM)—and also by most lawyers, physicians, and ethicists—despite evidence that circumcision is painful, traumatic, disadvantageous, and has serious lifelong consequences. This has remained the case even during an era when children's rights are increasingly advocated, at least until the rise of preservationism. In contrast, forced genital cutting of females has found few advocates and numerous opponents. It has not only been widely labeled a human rights violation, but is prohibited in many countries. In light of this, the freethought community's general failure to oppose forced male genital cutting seems peculiarly sexist if not misandrist.

Promotion. Promotion of genital cutting by evangelists for the practice is based on the belief that cutting, removing, or altering a child's genitalia will bestow upon the child certain negative or positive characteristics, including acceptance into a social group, conformity to a social norm, compliance with sexual norms, protection from disease, assurance of marriageability, control of sexuality through loss of function and decreased sexual pleasure, physical disfigurement, and more. What all of these diverse methodologies or rationales have in common is the primary goal: sexually altering the child.

Male circumcision is mistakenly regarded as a Jewish innovation, but the Jewish circumcision requirement was not original to the Bible. It had been previously used in Egypt and Africa to mark and sexually neutralize slaves. Jewish priests in Old Testament times seized upon the mutilation to cement their control over men through a required blood sacrifice, which could only be performed under the priests' auspices. Maimonides, a fifteenth-century Jewish scholar, reaffirmed religious circumcision as a physical reminder to men that by desensitizing their penis, they would focus on spiritual duties, adding that the procedure's pain was advantageous to accomplishing that task. In medieval times, Jews captured and circumcised non-Jewish boys as well as their non-Jewish servants, showing a markedly different understanding of the procedure.

The Christian Bible contradicts itself regarding circumcision, the Old and New Testaments taking opposite stands. Early Christianity took a strong stand against circumcision in the first century, forbidding the practice even though the first Christians were Jews. Infant circumcision has never been a religious requirement for Christians, yet many circumcise their boys, but not their girls. Although some Catholics circumcise their boys, the Catholic

Church rejected ritual circumcision as early as at the Council at Jerusalem (51 CE), a position reaffirmed at the Council of Vienna (1311) and in the papal bull of 1442.

As recently as 2003, the Malaysian government proposed using mass circumcision ceremonies to promote racial harmony. Meanwhile Egyptian fundamentalists consistently ignore their country's ban on female circumcision.

Forced religious conversion by circumcision occurs in many parts of the world, including in Indonesia, Sudan, and Pakistan (performed by Muslims); the United States (performed by Jews and Muslims); and in Kenya and South Africa (performed by traditional circumcisers). Such circumcision is most often performed on nonconsenting or coerced minors.

Medicalization. Many circumcision evangelists are physicians who gain financially from the practice. Members of this group have advocated circumcision as a cure-all since 1870. Throughout this period, evangelist physicians have invented new claims that circumcision is beneficial as quickly as previous false cures have been exposed. A cure looking for a disease, the latest in this long list of falsehoods is the claim that male circumcision is prophylactic against HIV/AIDS.

Renunciation. Jewish literature and tradition include several instances in which circumcision was renounced. Moses is believed to have abandoned the practice during the Jews' forty-year journey in the wilderness. Joshua is said to have reinstated circumcision at Gilgal after the death of Moses. Hellenistic Jews voluntarily restored their amputated foreskins in order to participate in Greek sporting events, which were usually performed in the nude. Jewish athletes would stretch their penile skin to cover their glans penis in order not to appear mutilated to the body-conscious Greeks. More recently German and American Jews participating in a Jewish reform movement (1843) proposed abolishing ritual circumcision, declaring that it was a cruel practice and not necessary for Jews.

Present-day nonobservant Jews increasingly reject ritual circumcision, *brit milah*, performed on the eighth day of life by a *mohel*, replacing it with a secular circumcision performed by a hospital physician shortly after birth. Some Jewish parents have replaced genital cutting with *brit shalom*, a noncutting birth ritual similar to the naming ceremony performed upon newborn Jewish girls. Other Jews simply forgo the practice altogether (see JUDAISM, UNBELIEF WITHIN). Christianity can be viewed as a former Jewish sect that renounced ritual circumcision of its males, eventually leading to a complete separation and the subsequent founding of a new religion in the beginning of the second century CE.

Revenge by Proxy. Divorced or separated parents may insist on cutting their sons' or daughters' genitals—using culture, religion, or hygiene as an excuse—to enrage their estranged spouse. The child may be secreted away to a circumciser in another state or country. This particular assault, even though illegal in some jurisdictions, is commonplace.

Persecution and Prohibition. Circumcision has been prohibited and its practitioners persecuted at various times in history. Classical Greeks and Romans placed a high value on the foreskin and the possession of a whole and unscarred body; they passed several laws to protect the prepuce (foreskin) by prohibiting circumcision. Circumcision was again prohibited during the French Revolution. The former Soviet Union abolished Jewish ritual circumcision in 1918. A counterexample is furnished by the Third Reich, which intentionally did not outlaw circumcision because the presence of a circumcision scar aided in identifying Jews. During the partitioning of India in 1947, a man's life—and his family's—depended on whether or not he was circumcised. If not, Muslims killed him; if so, Hindus and Sikhs killed him. Today traditional circumcisers in Kenya may be arrested if found forcibly circumcising males, yet they insist they will continue targeting uncircumcised boys since their tradition demands that all men be circumcised.

Sweden banned traditional circumcision in 2001, requiring circumcision of boys by physicians only. The child must receive pain relief administered by a physician or qualified nurse. The law has provoked strong opposition from the world's Jewish communities, which have accused the Swedish parliament of instituting the first law against Jewish religious practice since World War II. Meanwhile Denmark proposed a circumcision ban in 2004 on human rights grounds. Opponents painted this as a hostile initiative toward the country's Muslim minority.

Efforts to ban male genital cutting are sometimes labeled as anti-Semitic, even though religious circumcisions comprise a small fraction of the circumcisions performed. For example, in the present-day United States, less than one-tenth of 1 percent of all circumcisions are performed during a religious rite.

Defunding Circumcision Coverage. Since the middle of the twentieth century various countries, mostly Western, have experimented with removal of public funding for circumcision procedures. The United Kingdom was the first country to end national health plan coverage for infant circumcision in 1948. Canada has defunded coverage for circumcision in all of its provinces. In 2005 Denmark and Finland were discussing a ban of male circumcision or the elimination of coverage by national health plans. The Netherlands dropped coverage of infant circumcision from its national health plan in 2005. Sixteen American states have defunded routine male infant circumcision in their Medicaid programs as of 2005; more states are now considering the same step, all without sparking religious controversy. Opponents painted New Zealand's 2005 exclusion of circumcision from coverage under its national health plan as evidence that the New Zealand government is discriminatory and anti-Semitic. In this context, it is worth noting that since its founding in 1948, Israel has never covered infant circumcision in its national health plan.

Genital Integrity Movement. Physicians have published warnings about the harm of circumcision since 1890, and no medical society in the world recommends the procedure. At no time in its seventy-five years has the American Academy of Pediatrics ever recommended infant circumcision, and the American Medical Association goes even further, calling it "nontherapeutic." Yet even this criticism fell short of achieving real cultural momentum. A noteworthy contemporary development is anticircumcision activism based on emerging concepts of human rights. This opposition is not unconditional, as rare occasions are recognized when foreskin amputation is medically required—for example, to excise necrotic tissue following an accident, untreatable disease, or frostbite. This grassroots movement is opposed to cultural and ritual genital cutting, but not to life-saving medical treatment, hence, it is most accurately called the genital integrity movement. It opposes cultural and ritual genital modification from a stance based on humane bodily preservation and fundamental human rights.

The genital integrity movement began in earnest in 1985 with the formation of the educationally oriented National Organization of Circumcision Information Resource Centers (NOCIRC), an advocacy organization that now operates more than one hundred centers worldwide. Since then, other organizations have been founded around the world to oppose the practice.

Organizations that specifically oppose religious circumcision have been created in the past few years. Jews against Circumcision opposes Old Testament circumcision practice from a bodily integrity and children's rights perspective. Catholics against Circumcision opposes circumcision based on New Testament scripture and church teachings. In what may be a modern-day episode of Jewish renunciation, Jews tend to be overrepresented in the genital integrity movement relative to their numbers in a given country's population.

Various streams of anticircumcision activism are coalescing in the contemporary movement, encompassing not only opposition to male and female genital cutting but also opposition to the involuntary alteration of intersexed infants and children. At the same time the focus of the genital integrity movement is shifting from the immediate protection of individuals to a commitment to preserve future generations from a human rights violation through societal change.

In one example of this expanding activism, a 1996 US ban on female genital mutilation has come under attack as being unconstitutional because it does not provide fair and equal treatment. Efforts are under way to make the law's language gender neutral, which would continue protection for girls, and make nontherapeutic infant circumcision of boys and gender-norming surgeries upon intersexed children illegal without prior informed consent of the patient.

The International Coalition for Genital Integrity has proposed a moratorium on circumcision until such time as critical questions concerning physical and psychological health, as well as bioethical concerns for autonomy and nonmaleficence are fully answered (see BIOETHICS AND UNBELIEF).

Regardless of the ignorance, good intentions, or superstitions of parents and circumcisers, genital cutting remains a generally unopposed and unprosecuted assault on defenseless, nonconsenting children.

DAN BOLLINGER

CLEAVER, ELDRIDGE (1935–1998), African American activist. Eldridge Cleaver was born Leroy Eldridge Cleaver in Wabbaseka, Arkansas, but raised in California. Incarcerated on a 1958 assault conviction, he spent much time reading and thinking about the oppression of blacks in the United States. He read FREETHOUGHT works by such luminaries as Robert Green INGERSOLL and embraced a secular Marxist/Leninist worldview.

Paroled in 1966, he joined the militant Black Panther Party, becoming its minister of information. In 1968 he wrote his best-known work, *Soul on Ice*. This collection of essays received great critical acclaim. Later that year, he ran for the US presidency on the Peace and Freedom Party ticket. In that same eventful year, he was involved in a shootout with police in Oakland, California, home of the Panthers' national headquarters. Cleaver and another Panther were injured. Cleaver was arrested and convicted. On November 24, 1968, three days before he was to be sentenced for his role in the shootout, he fled the country and eventually escaped to Algiers.

While in exile in Algeria, Cleaver continued to write and speak out, opposing male chauvinism among the Panthers and the bigoted cultural nationalism on the part of black activist Stokeley Carmichael, the Nation of Islam's (NOI) Elijah Muhammad, and others. He applauded Malcolm X for denouncing racism and breaking away from the NOI to form the secular Organization of Afro-American Unity.

In 1975 Cleaver returned to the United States; charges against him were dropped. He claimed to have had a religious awakening, and also reported abandoning many of

his former political beliefs. He became an extremely conservative Christian, at one time flirting with the Unification Church of Reverend Sun Myung Moon. He was baptized in 1982 and was briefly a priest of the Church of Latter Day Saints, though he was listed as a church member until he died.

In 1986 Cleaver made an unsuccessful bid to be nominated as a Republican candidate for the United States Senate in California. He embraced American capitalism and conservative Christianity, yet continued to argue for women's rights. He remained opposed to the black cultural nationalism of Minister Louis Farrakhan and the NOI.

Like the Harlem Renaissance poets Claude McKAY and Langston HUGHES, Cleaver became religious after his best years were behind him. However, his legacy as a leader of one of the most fascinating organizations in the history of black America is secure.

NORM R. ALLEN JR.

CLEMENS, SAMUEL LANGHORNE (MARK TWAIN; 1835–1910), American author. America's most renowned author, Mark Twain lived an extraordinarily varied, productive, and complex life. He was born and raised in Missouri and subsequently spent significant parts of his life on the Mississippi River and in Nevada; California; Hawaii; Buffalo and Elmira, New York; and Hartford, Connecticut. He resided overseas for long periods of time in England, Italy, and Austria, and he traveled widely in the United States, Europe, the Holy Land, Australia, and India. By 1869 he had been a printer, a Mississippi River steamboat pilot, a gold and silver miner in Nevada, a journalist for Nevada and California newspapers, a lecturer, a nationally acclaimed author, a personal secretary for a United States senator, a lobbyist in Washington, and a newspaper publisher. After 1871 he settled down to writing and spent most of the rest of his life composing the works that have since become famous, especially *Innocents Abroad* (1869), *Roughing It* (1872), *The Adventures of Tom Sawyer* (1876), *Life on the Mississippi* (1883), *The Adventures of Huckleberry Finn* (1884), *A Connecticut Yankee in King Arthur's Court* (1889), and "Letters from the Earth" (1909/1962). The importance to his thinking of his lifelong religious struggle is not commonly recognized, but the unorthodox religious ideas obvious in his late writings can be traced back in an unbroken line to his youth.

Religious Odyssey. The first exposure of Sam Clemens to religion lasted as an influence on him for his entire life. He attended a Presbyterian church in Hannibal, Missouri, that taught severe Calvinist doctrines. Chapter 5 of *Tom Sawyer* describes the sort of sermon that young Sam Clemens heard many times: a complicated argument about "limitless fire and brimstone" and a deity that predestined the great majority of humankind to damnation and elected only a minuscule number to salvation. As Sam grew older, he encountered Thomas PAINE's criticism of the Bible and conventional Christian theology and was intellectually converted to Paine's DEISM. Still later, after Clemens became Mark Twain and fell in love with Livy Langdon, whose family in Elmira were active adherents of liberal, evangelical Protestantism, he tried for some years to fit himself into that mold. The effort was unsuccessful; after imbibing Paine's deistic SKEPTICISM, he could no longer believe in the literal truth of the Bible or view all of its doctrines, and especially its deity, as benevolent. Despite this, the Calvinistic lessons of his youth retained a grip on him that he could never shake off. Twain mediated the conflict between his intellectual preferences and his emotional convictions with the use of irony. He attended a liberal Congregational church in Hartford, but often referred to himself in his writings and lectures as a Presbyterian and joked about Calvinist doctrines. In his later years, Twain continued his close friendship with his Congregational pastor Joseph Twichell, but was attracted to philosophical DETERMINISM and in 1906 published *What Is Man?* an extremely bleak argument that man is only a machine, programmed and totally controlled by such outside forces as heredity, training, and environment. Nevertheless, as "Letters from the Earth" shows, his mind was still profoundly preoccupied with religious issues concerning God and predestination.

Religious Convictions. Despite his public appearances and his intellectual preferences, Twain in effect remained a Calvinist his whole life, though a heretical one (see HERESY). His fundamental convictions can be inferred from an analysis of his literature, which early and late at its deepest levels reflects what in effect amounts to a "countertheology" to Calvinism. Indeed, the main works of his literature cannot be fully compre-

hended without appreciation of their theological foundations. Twain followed conventional Christianity in that he continued to believe in an omnipotent and omniscient God, but whereas Christianity maintains that God is benevolent, Twain's heresy was that he saw God as a malevolent trickster, whimsical and usually devious and cruel. In the published works of his early and middle periods, when he was still establishing his reputation and was apprehensive of alienating readers by his heretical beliefs, he concealed these positions very subtly, often under comic surfaces whose humor sugarcoated bitter cores. (Some posthumously published works from these periods display these core views more openly.) They could almost escape detection were they not the thematic elements that unify each of his important works and run through his oeuvre, constituting a common thematic signature. In his later period, after 1889, Twain was less concerned about disguising his beliefs. Accordingly, his heretical views are more easily seen—sometimes unavoidably—in works such as "The Man That Corrupted Hadleyburg" (1899), *What Is Man?* "Letters from the Earth," and the *Mysterious Stranger* fragments (1897–1908/1916).

Twain's central religious beliefs can be summarized as follows: (1) He believed in the existence of an inscrutably malevolent deity who is not a god of truth. Both testaments teach that he is infinitely loving and merciful but their records of his actions and commands expose him to be quite the opposite. (2) God immutably predestined all of creation. All events, and all details in individual lives—actions, words, thoughts, and feelings—are predestined. Nothing occurs by chance; there are no accidents. As a consequence, freedom and free will are illusions and impossibilities. (3) Human nature has been so (predestinedly) perverted by original sin that every individual deserves damnation. (4) Double damnation: so corrupt is human nature that even if humans had not already been predestined, the sins of even the most virtuous would infallibly damn them. (5) The overwhelming majority of the human race *is* reprobated to hell. Only a very small fraction of it has been elected for salvation, and not for any merit of its own but only because of God's mysterious and unearned grace.

All of these positions except the first are derived from Calvinism. Twain always hated them for being shockingly unfair and cruel, but he believed them because they accurately described the world he saw. Accordingly, tragedy in his works usually involves finite and fallible humans being cast as the unsuspecting playthings of a monstrous deity that deceives, tortures, and then defeats them.

LAWRENCE I. BERKOVE

CLIFFORD, WILLIAM KINGDON (1845–1879), British mathematician, ethicist, and freethinker. William Kingdon Clifford is best remembered for his 1876 essay "The Ethics of Belief," in which he made the memorable assertion: "It is wrong always, everywhere, and for anyone, to believe anything upon insufficient evidence."

Clifford's Life. Clifford was born in Exeter, England. His father was a bookseller who dealt largely in devotional material and served for a time as a justice of the peace. Clifford's mother, whose maiden name was Kingdon, died when he was only nine. A precocious child, Clifford was educated at a small local school until the age of fifteen, when he was sent to King's College, London. Here, he began to reveal abilities not only in his chosen profession of mathematics, but also in the fields of literature and classics. In 1863 he won a scholarship to Trinity College, Cambridge.

Although slight in build, Clifford prided himself on his physical strength. His proudest feat, taken on a dare, was to hang by his toes from the crossbars of a church tower's weathercock—one of the last times he was to find himself near a church of any sort. In 1871, at the young age of twenty-six, Clifford was appointed to the professorship in applied mathematics at University College, London, where he would spend the remainder of his short career. It was a congenial place for a freethinker (see FREETHOUGHT) like himself, since it was founded in 1827 to be a strictly secular institution, where professors would be free from having to swear allegiance to any religious oath. In 1874 Clifford was elected as a Fellow of the Royal Society, one of the highest scholarly honors in the United Kingdom. He had previously turned down

the offer, with the remark that he did not want to be respectable just yet.

In 1875 Clifford married Lucy Lane, by whom he had two daughters. Unfortunately, the marriage was to be a short one, as Clifford died at age thirty-three after a long battle with tuberculosis. His mathematical and philosophical papers were published posthumously by friends, including fellow freethinker Leslie STEPHENS (the father of Virginia Woolf). He is buried in London's Highgate Cemetery, with the following epitaph on his tombstone: "I was not, and was conceived; I loved, and did a little work; I am not, and grieve not."

Crisis of Faith. Clifford had been an Anglican in his early years, but came to lose his faith in the historical accuracy and present relevance of the teachings of Christianity. But unlike many others in his time—such as Matthew Arnold, who saw his own loss of faith as tragic—Clifford viewed this as a *positive* experience, not a cause of despair. He saw knowledge in terms of adaptability. As new information became available, humans could learn more about how the universe really works, as opposed to relying upon the patchwork beliefs which religious institutions offered as truth. Just as the Greek and Roman civilizations had overcome their reliance upon Zeus and Jupiter, so the modern world could overcome its reliance on Jehovah and Jesus.

Evolutionary Views. The impact of evolutionary theory (see EVOLUTION AND UNBELIEF), which had been hotly debated since the publication of Charles DARWIN's *On the Origin of Species* (1859), had a major impact on Clifford, as did his reading the moral writings of Herbert SPENCER. He came to believe that it was no longer necessary to explain scientific discoveries through the prism of existing religious dogmas. He came to view clerical institutions as the chief obstacles to scientific and moral advancement, and an impediment to human intellectual and social growth. He saw clearly that the chief opposition to Darwinian evolutionary theory was coming from the pulpits, and he allied himself with Thomas Henry HUXLEY, the biologist popularly known as "Darwin's Bulldog." His own writings on the possible biological basis of morality in many ways anticipated the field of evolutionary ethics (see ETHICS AND UNBELIEF).

Mathematical Contributions. Clifford was one of the first English mathematicians to become knowledgeable about the work being done on non-Euclidean geometry by Bernhard Riemann and Nikolay Lobachevski, going so far as to translate the former's work and publish it in the influential journal *Nature*. The introduction of non-Euclidean geometry was not only a challenge to mathematicians in particular—it was also a blow in general to those philosophers and theologians who held to the existence of necessary and universal truths. If even Euclid's axioms could be questioned, after thousands of years of being unquestioned, then what *else* might prove assailable? In addition, Clifford did work on the application of geometry to physics, and anticipated certain aspects of Albert Einstein's theory of gravitation.

Clifford's Materialism. One of the extracurricular activities Clifford became involved with was investigating psychical research. However, unlike many of his fellow professors, he was not taken in by so-called spirit mediums (see SPIRITUALISM AND UNBELIEF). In fact, he became a fierce advocate of the view that there was no such thing as disembodied consciousness (see SKEPTICISM), and he delighted in debunking paranormal claims. The field of psychology was just being formed, and it was still unclear what its limits would be. Clifford made it a special point to show how supposed psychics were guilty of using trickery of the basest sort to fool not only credulous believers but also learned professors. In addition, he argued that psychology's proper study was the physical brain and how it worked, *not* disembodied elements like ghosts. Not wishing to be considered a dualist, he devised a theory of "mind-stuff," which he held to be the basic unit of the universe. Although not all things possess mind or consciousness, they all possess some element of mind-stuff, and when such elements come together in a large enough unit, there is the beginning of sentience.

"The Ethics of Belief." In 1876 Clifford was elected to the famous debating group the Metaphysical Society, the youngest member so chosen. Members included his fellow freethinker T. H. Huxley, as well as such stalwarts as Catholic archbishop Henry Manning, Poet Laureate Alfred Lord Tennyson, and two British prime ministers, William Gladstone and Arthur Balfour. The society's discussions, which were primarily concerned with arguments for or against the rationality of religious belief, were of the highest caliber. For Clifford, the exercising of intellectual abilities in the company of fellow critical thinkers (whether they shared the same conclusions or not) was an opportunity not to be missed, and he attended as many sessions as he could. It was here that he delivered his most famous lecture, "The Ethics of Belief."

In this paper, Clifford argued that it was immoral to hold a belief for which one has no evidence. The method of science advocated treating all beliefs as provisional, and by advocating such a method society would free itself from the hold of false and pernicious beliefs. Not to test one's beliefs was not only a bad habit, it was a "sin" against general humanity. Many years later, the American philosopher William James, in his famed 1896 essay "The Will to Believe," was to chide Clifford for holding too stringent a view of belief formation and preservation. But Clifford had argued that it was permissible to act upon probabilities and inferences, provided one recognized them as such, rather than treating them as revealed truths or unassailable doctrines. Clifford's view has come to be called EVIDENTIALISM, and remains a controversial area in current epistemological debates.

Clifford as Freethought Activist. One of the last projects Clifford worked on was especially near and dear to his heart. After discussions with Huxley, he came to

the conclusion that a gathering of freethinkers from across the world should be held, the aim of which would be to liberate the peoples of all classes from degrading dogmas. Combining his republican sentiments with his scientific advocacy, Clifford was the driving force behind the Congress of Liberal Thinkers, which was held on June 13–14, 1878, at the South Place Chapel in England (see SOUTH PLACE ETHICAL SOCIETY), just a few days after the commemoration of the centenary of VOLTAIRE's death. More than four hundred delegates came from throughout the world. Unfortunately, his poor health prevented Clifford's attending. A fierce freethinker to the end, when made aware of a newspaper report which claimed that he was converting back to Christianity in his final days, he fired back a retort that, while his doctor had certified that he was ill, "'twas not mental derangement."

TIMOTHY J. MADIGAN

CLOUGH, ARTHUR HUGH (1819–1861), English poet and agnostic. Arthur Hugh Clough's AGNOSTICISM damaged his career and enhanced his poetry. The title of one of his poems, "The Questioning Spirit," sums up his life and work.

Clough was born in Liverpool in 1819, went with his family to the United States in 1822, and returned for an English education in 1829. He entered the renowned independent school Rugby, whose headmaster, Dr. Thomas Arnold, had a great influence on him. He was a prodigious youth, winning prizes and gaining prominence as head boy.

Clough entered Balliol College, Oxford, where he expected to continue his brilliant career. He saw it as a disaster when he gained a Second Class degree, not the expected First. He thus failed to gain a fellowship at Balliol, but gained a fellowship at the less prestigious Oriel College. Religious discussion was rife at Oxford. Clough was expected to be ordained if he continued in his Oriel fellowship, but he felt that he could not subscribe to the Thirty-nine Articles of Faith of the Church of England, and left.

In 1848 he briefly took a position at a Unitarian hall of University College (see UNITARIANISM TO 1961), where religious affiliation was not insisted upon. He endeavored but failed to gain a position in the United States, where he had contact with Ralph Waldo EMERSON. Though he had published some admired poetry he felt his promise failing him, and was persuaded by his fiancée to take a post as examiner in the Education Office in London. Blanche (née Smith), now his wife, was cousin to Florence Nightingale, and Clough helped her in her writing and lobbying.

Clough traveled in Europe: to Paris at the time of the 1848 Revolution, to Rome at a time of conflict in 1850, and to Florence, where he died in 1861. His long poems, such as "Amours de Voyage" and "Dipsychus," have such places as their background and figures who are doubters and republicans, and have sexual feelings (which some Victorians denied). Two poems of particularly sceptical tenor are "Epi-Strauss-ium" and "Easter Day." The former refers to David Friedrich STRAUSS, whose 1835 *Leben Jesu* (Life of Jesus) portrays a Jesus who was human, not divine. The latter reiterates "Christ is not risen" throughout a resurrection-denying ode. Two of Clough's best-known lines are from "The Latest Decalogue," a sly satire on the Christian Ten Commandments:

> Thou shalt not kill; but needst not strive
> Officiously to keep alive.

These words are often quoted by supporters of voluntary euthanasia.

It was Clough's misfortune that he doubted not only religion but more importantly himself, which led to an unfulfilled life.

COGNITIVE SCIENCE AND UNBELIEF. The cognitive sciences are those that investigate the processes and constituents of thought. The range of phenomena that are studied is broad, including the subsecond processes of

visual perception and the multigenerational processes of cultural change. The cognitive sciences include psychology, neuroscience, artificial intelligence, anthropology, philosophy, linguistics, and education. This interdisciplinary field often incorporates a view of cognition as a kind of information processing, leveraging insights from computer science and artificial intelligence in order to understand the structure of mental processes.

The recognition of supernatural entities, or the denial of the same, involves cognitive mechanisms. Thus, the cognitive sciences may shed light on the nature of belief and unbelief. In particular, studies of cognition have provided insights concerning (1) the nature of knowledge and beliefs, (2) how individuals draw inferences from their experiences, (3) why religious beliefs and practices are so common across cultures, and (4) what neural and cognitive mechanisms give rise to religious experiences (see RELIGIOUS AND MYSTICAL EXPERIENCES).

It is common to conceptualize a particular belief as a kind of proposition—a statement or sentence—that is marked with a "propositional attitude" that indicates that the statement is believed to be true. Under this view, the beliefs of an individual would simply be a collection of such propositions, represented in a way that allows them to generate consistent behavior. While beliefs are frequently communicated and contemplated in such a linguistic format, research in the cognitive sciences has increasingly found the knowledge that drives behavior to be much more fragmented, compartmentalized, graded, and situation specific. Rather than possessing a single pool of beliefs that are all consistently recalled and applied in any situation, it appears as if knowledge is largely fragmented across different cognitive skills and processes. Thus, knowledge regularly invoked and used in one situation may be completely ignored, or even contradicted, in another. It appears as if "beliefs" only describe the pattern of performance produced by various cognitive processes and skills, while different domain-specific cognitive processes within a single individual may reflect different contradicting "beliefs." This raises the question of whether it truly makes sense to ascribe "beliefs" to individuals, except as a kind of shorthand for coarse regularities in behavior. This domain-specific view of the organization of knowledge also helps to explain why inconsistent behaviors are so frequently overlooked by the true believer.

The domain specificity of knowledge and cognitive skills also provides some insight into why intellectually competent individuals can sometimes exhibit surprisingly poor reasoning in specific domains, such as religion. In general, people frequently exhibit essentially optimal reasoning performance in familiar domains that afford rich opportunities for practice, but fail miserably when those same reasoning skills are needed to deal with novel issues. Cognitive skills learned in one context often show dramatically little transfer to unfamiliar contexts. Since most people receive little practice reasoning about challenging issues of belief, it is not surprising that there are intellectual giants who reason like novices in this domain.

Even within a specific domain, the cognitive processes involved in drawing inferences from experience exhibit systematic patterns of error. It is tempting to imagine the process of learning about the world as one in which raw, uninterpreted experiences are analyzed in search of robust regularities that capture the causal structure of reality. This does not seem to be an accurate characterization of human learning processes. Cognitive learning mechanisms appear to be strongly "hypothesis driven," embodying "working hypotheses" about the nature of the world that can be incrementally modified by experience. Importantly, these "working hypotheses" color the very perception of our experiences, causing some aspects of our experiences to be attended and others ignored. Aspects of our experiences that are consistent with these "working hypotheses" are more easily retained in our memory, as well, with violations of expectations being lost unless they are particularly salient. This "hypothesis-driven" nature of learning also gives rise to a phenomenon known as "confirmation bias," in which evidence in favor of the current hypothesis is recognized and remembered much more reliably than evidence against that hypothesis. The result of these systematic biases is a kind of resistance to belief revision—a resistance that is particularly evident in domains in which complex experiences lend themselves to a multitude of interpretations, such as politics or religion.

In addition to uncovering general properties of knowledge and belief, some cognitive scientists have investigated questions that deal specifically with religion and religious experiences. One important question involves the cross-cultural prevalence of religious belief. Why is religion so common? Proposed answers to this question fall into two general categories: (1) religion is useful, and (2) religion is a side effect of other cognitive processes. Many researchers have identified positive contributions that religion makes to individuals and to communities, and they have argued that these positive effects have led to the cementing of religious propensities either in the human genome through natural selection or in various cultures through cultural evolution. Unfortunately, the cited positive contributions offer little in the way of explanation for the commonalities of religious belief across cultures. For example, some have argued that religion leads to community cohesion and cooperation, and has, therefore, led to cultural success. It is not clear, however, why frameworks for communal cohesion require the positing of the spirits and gods that are nearly universal constituents of religious belief. Other researchers argue that religion answers a deep individual need for answers concerning the nature of the universe, but this explanation seems to ignore the facts that (1) many people seem quite happy without such answers and (2) many religions offer little in the way of

explanation, relishing mystery over knowledge. It is common in the West to see religion as a means to calm one's fear of death, but this cannot explain the ubiquity of religion, since many religions lack an afterlife or offer only a kind of afterlife that is "worse than death." In short, while it is difficult to deny that religion has served a variety of constructive purposes, these contributions generally fail to explain why religion is so common. An alternative to the "religion is useful" response to this question is to posit that religious belief is a side effect of other cognitive processes. Just as our experience of optical illusions is a side effect of how our visual system has evolved to deal with natural scenes, religious belief may be a side effect of how our brains have evolved to solve practical daily problems. In particular, humans are social primates whose evolutionary history is steeped in daily strife over issues of cooperation and conflict. Cognitive scientists have produced a growing body of evidence that the social nature of both our evolutionary past and our upbringing has shaped the cognitive mechanisms of our brains. For example, there appears to be a region in the temporal lobe of the brain that is particularly well-suited to process views of faces. Infants appear to distinguish between animate and inanimate objects early in development, suggesting that the brain is primed to learn this distinction. In some cases, people exhibit much better reasoning performance on social problems than on logically identical nonsocial reasoning problems. It may be the case that our social cognition capabilities have become so central to our success that they are automatically engaged and employed whenever a problem is to be solved. Thus, when lightning strikes a friend, our social cognition mechanisms immediately interpret the event in a social way, asking questions like "Who will benefit and who will suffer from this event?" "Who wanted this event to happen?" "Was this retribution for a violated social pact?" and so on. The constant autonomous functioning of social cognition systems could thus readily fabricate interpretations of events—"working hypotheses" concerning what happened—that involve unseen agents and "divine laws." In short, this view holds that coming up with social explanations for observed events is so important in our daily lives that our brains now produce such explanations automatically, even in situations in which a social explanation is inappropriate. This account explains the ubiquity of religion in terms of the universal importance of human social interaction, with the widespread appearance of spirits, gods, and magical action-at-distance arising from the reflex of social cognition systems to ascribe agent-based interpretations to situations in which no agents are visibly present. This hypothesis concerning the widespread nature of religious belief is consistent with a broad array of findings in the cognitive sciences, but it is still somewhat controversial. Research efforts are ongoing in search of additional supporting evidence for this account.

Most people acquire religious beliefs slowly, integrating the explicit education provided by their culture with their own daily experiences. Some individuals, however, have punctate experiences that substantially alter their religious beliefs and behavior. These experiences tend to be very emotional, filled with joy or dread, but they include other consistent properties, as well, such as a sense of the presence of an invisible "other" or a loss of the sense of self (see RELIGIOUS AND MYSTICAL EXPERIENCES). Cognitive neuroscience has begun to investigate the neural mechanisms that give rise to such experiences, offering a physical explanation for these phenomena to replace the standard explanation of spiritual revelation. Prompted by studies of temporal lobe epileptics, who sometimes report life-changing religious experiences during seizures, researchers have hypothesized that anomalous electrical activity in this part of the brain may give rise to such revelations. The temporal lobe contains a large variety of neural circuits, but the healthy function of some of these circuits appear to be particularly relevant to religious experiences. The outer cortical layers of the temporal lobe contain high-level portions of the visual system, embodying knowledge about the appearance and meaning of visual objects, including faces. This cortical tissue is also involved in the processing of linguistic meaning, suggesting that inappropriate stimulation may result in "hearing voices" or "receiving messages." Deep inside the temporal lobe are brain areas associated with emotional processing and structures involved in autobiographical memory. Stimulation of emotion areas may imbue religious experiences with a deep sense of personal significance, while anomalous electrical activity in memory areas might decouple current mental experiences from the "sense of self" constructed by our own personal memories, either disrupting this sense of self or making thoughts appear to stem from some other agent. Thus, it is quite possible that religious experiences are the natural result of inappropriate stimulation of temporal lobe brain areas. Indeed, magnetic fields can be used to induce electrical activity in the temporal lobe, and doing so can sometimes produce powerful hallucinations similar to religious experiences in healthy people. These experiments offer strong evidence for a physical, rather than supernatural, cause for religious experiences.

Researchers have also investigated the neural basis of experiences reported during meditation and prayer. Using modern brain-imaging techniques, changes in the activity of different brain areas can be detected while a subject is meditating. These studies have discovered a variety of interesting results, including an increase in frontal lobe activity and a decrease in activity at a particular locus in the parietal lobe. Frontal activation is often associated with effortful deliberation and purposeful focus of attention, which is likely to be present during meditation. The parietal lobe is involved in the representation of space around the body and active movement in

that space, suggesting that the decrease in activity in this region may result in the "becoming one with the universe" feeling reported by some meditators. Once again, the cognitive sciences have offered hypotheses concerning the phenomenology of meditation and prayer that depend on the physical properties of the brain, rather than supernatural communication.

The cognitive sciences primarily focus on the fundamental processes of perception, thought, and action. This field has begun to paint a sufficiently elaborated portrait of human cognition, however, to begin the process of generating scientific hypotheses concerning the nature of belief and unbelief. As this line of inquiry continues, further efforts will be needed to test these hypotheses, providing additional supporting evidence for natural explanations of religious belief and religious experience.

DAVID C. NOELLE

COHEN, CHAPMAN (1868–1954), English atheist journalist and campaigner. Chapman Cohen was born on September 1, 1868, to a Jewish family living in Leicester. Largely self-educated, Cohen had read many of the classic works of philosophy by the time he was seventeen. The two greatest influences on his thought were Baruch SPINOZA and Herbert SPENCER. Cohen came to FREETHOUGHT in 1889 after hearing a Christian Evidence Society speaker bullying and deriding an aged secularist. He immediately took the old man's side in the dispute, inquired into his beliefs and, soon after, joined the NATIONAL SECULAR SOCIETY (NSS). Cohen became a prominent member of the organization, and was one of its most popular and effective speakers for half a century. He was elected vice president of the NSS in 1895, and was widely seen as the person who would succeed G. W. FOOTE, the society's president. When Foote died in 1915, Cohen did indeed become president of the NSS and editor of its journal, the *FREETHINKER*. He remained a staunch defender of Foote's reputation for the rest of his life.

During these years Cohen was active in representing the NSS's interests in a lengthy legal struggle over a large bequest to the society, which had been challenged by aggrieved relatives on the grounds that bequests to organizations critical of religion were illegal. Such was the discrimination against freethinkers at the time that this objection commanded some legal validity. However, the NSS won the case in April 1915, the family's appeal was lost in July the same year, and the legality of the Bowman bequest was finally ratified by the House of Lords on May 14, 1917. This was a considerable victory in the struggle for the right of freethinkers to receive bequests.

Cohen's other lasting contribution was his steady stream of journalism. His editorship of the *Freethinker* lasted from 1915 to 1951, which makes him one of the longest-serving editors of any publication in freethought history, ranking alongside Charles Albert WATTS with the *Literary Guide*, Horace SEAVER with the *BOSTON INVESTIGATOR*, and James O. HANLON with the *New Zealand Rationalist*.

Much of Cohen's journalism was reprinted in pamphlet or book form. He had a strong preference for short works accessible to the general reader. His themes were dominated by classical freethought: the errors of the Bible (see BIBLICAL ERRANCY), the pagan origins of Christianity, free will and DETERMINISM, evolution over creation (see DARWINISM; EVOLUTION AND UNBELIEF; RELIGION IN CONFLICT WITH SCIENCE), and religion as a bar to progress. One of his most important contributions, and what set him apart from many of his contemporaries,

was his fearless and consistent advocacy of ATHEISM rather than AGNOSTICISM. His were among the clearest expositions of popular atheism in the first half of the twentieth century. Cohen also put his excellent speaking skills to use in some memorable debates, most notably with Sir Arthur Eddington, a theistically inclined physicist, and Cyril Joad, a popular philosopher with leanings toward vitalism.

After World War II Cohen started to age rapidly. He eventually stepped down as president of the NSS in 1949, but retained, probably unwisely, the editorship of the *Freethinker* for two more years. He died on February 4, 1954. Cohen kept the details of his private life out of the public arena. We know little more than that he was happily married, and had a daughter, who died tragically at age twenty-nine, and a son, Raymond, who became a physician.

BILL COOKE

COLENSO, JOHN WILLIAM (1814–1883), English clergyman and African activist. John William Colenso was born in St. Austell, Cornwall, on January 24, 1814, and educated at St. John's College, Cambridge, thanks to the help of prosperous relatives. After several years teaching at Harrow, Colenso joined the Church of England. In 1853 he was appointed bishop of Natal. The conscientious churchman learned Zulu so that he could translate religious works into that language. When asked by a Zulu convert whether the story of the Flood was literally true, Colenso found himself at a loss to answer in the affirmative. This inspired him to write a book called *The Pentateuch and the Book of Joshua Critically Examined*, the first part of which appeared in 1862. Colenso denied that Moses was the true author of the Pentateuch (the first five books of the Old Testament) and pointed out many other historical absurdities in it. This was at the time a very controversial, even dangerous, claim to make. Only a century before Colenso, the English radical Peter ANNET had suffered imprisonment and two spells in the pillory for the same assertion. The first imprint of Colenso's book sold ten thousand copies, coming in the wake of the fractious debates over Charles DARWIN's *The Origin of Species* and *Essays and Reviews*, a collection of articles on BIBLICAL CRITICISM, which at the time was still more controversial. The Church of England was alarmed to face this new challenge, coming as it did from a bishop. Even normally tolerant religious liberals like Frederick Denison Maurice were moved to castigate what they saw as the historical and religious untruths of the work.

Colenso was subjected to a great deal of harassment as a result of his book. All but three English bishops signed a letter demanding that Colenso resign his office, which he refused to do. While he was defending himself in England, an Episcopal synod in South Africa condemned Colenso in his absence. In November 1863 Colenso was charged with denial of the doctrines of the divinity of Christ, the Atonement, endless punishment in hell, and the literal inspiration of scripture. Colenso appealed to the Privy Council, as the writers whose works appeared in *Essays and Reviews* had done shortly before. As it had with the earlier case, the Privy Council found in favor of Colenso and declared the South African decision null and void. However, the fanatical opposition, led by Bishop Gray of Cape Town, was not to be put off. Gray publicly excommunicated Colenso in 1864 and continued his campaign until 1869, when Colenso was finally stripped of his office.

Undaunted, Colenso remained in South Africa, where he extended his study of the Pentateuch to cover seven volumes, concluding in 1879. His work was influential among European biblical scholars, in particular the Dutchman Abraham Kuenen. The hostility of Gray and others toward Colenso was motivated as much by racism as by theological conservatism. After all, Colenso had taken seriously the question of his Zulu convert. He also had an honorable record championing the rights of Africans. During his time as bishop of Natal, Colenso had compiled a Zulu-English dictionary and, more controversially, permitted Zulu converts to retain their polygamous marriages. Colenso died in Durban on June 20, 1883.

BILL COOKE

COLLINS, ANTHONY (1676–1729), English freethinker. The "Goliath of freethinking," as Thomas Henry HUXLEY described him, Anthony Collins was educated at Eton and King's College, Cambridge, where his tutor was Francis Hare, author of the unorthodox *Difficulties and Discouragements* (1714), which Collins often quoted.

Scion of a wealthy legal family, Collins studied at the Middle Temple, one of the major legal societies in London, but was never called to the bar. His acquaintances included Lord SHAFTESBURY, Robert Molesworth, John TOLAND, Matthew TINDAL, Pierre Desmaizeaux,

John Trenchard, Thomas Gordon, Thomas CHUBB, and, most notably, John LOCKE, with whom he became intimate in 1703. Locke's letters to Collins, printed in 1720, express a high regard for his amiable character, love of truth, and grasp of Locke's philosophy. Collins, wrote Locke fondly, had "an estate in the country, a library in town, and friends everywhere."

Theoretical Writing. Collins's authorship falls into two periods of about a decade each. From 1707 to 1717 most of his writings are theoretical; from 1720 to 1729 they are mainly historical. All of his publications are anonymous. He was not, as was often claimed, the author of *Several of the London Cases* (1700), although he probably assisted Tindal in *The Rights of the Christian Church* (1706), with whose anticlerical opinions he was certainly in agreement. In 1707 he published *An Essay concerning the Use of Reason*, in which he champions RATIONALISM and cognitive language. His defense of minimal standards of reason against important theological qualifications (in this case mysteries supposedly above our understanding) is a prevailing feature of his works.

With *A Letter to Dodwell, Containing Some Remarks on a (Pretended) Demonstration of the Immateriality and Natural Immortality of the Soul*, also printed in 1707, Collins began a debate with Samuel Clarke, in which by 1708 each of the disputants had issued four pamphlets. Although Collins argues for the materiality of the soul and against its natural immortality, he says that he believes in its supernatural immortality, that is, an afterlife based not on philosophy or reason but on the gospel. Despite this appearance of orthodoxy, these pamphlets established Collins's reputation as a leading infidel; they also exerted a considerable influence later in the century on the French atheists, particularly Paul Henri HOLBACH and Jacques Andre Naigeon.

Less influential but hardly of less philosophical importance is the *Vindication of the Divine Attributes, in Some Remarks on Archbishop [King's] Sermon* (1710). Collins is generally taken to be a deist (see DEISM), and he does say that he believes in God. But there is no reasoned defense of natural theology in his writings, and his actual arguments are subversive of all religious belief. Thus in the *Vindication* he shows that literal knowledge of God is a necessary condition for theistic belief; and that Archbishop King's fideistic negative theology, which was designed to overcome apparent contradictions among the divine attributes by making those attributes literally inaccessible, cannot satisfy this necessary condition. Nor does Collins do anything to remove these contradictions, to which, as he says, Pierre BAYLE had called attention in his *Historical and Critical Dictionary* (1697–1702).

Moreover, in his last pamphlet against Clarke, *The Answer* (1708), Collins argues that as our thinking is material, it has an "intire and total Disagreement with Thinking, in that only Immaterial Being." From this it seems to follow that we can have no literal knowledge of God, and hence the necessary condition for theistic belief cannot be met. Again, in *The Answer*, Collins argues that in order to prove the existence of God it is necessary to have some idea of the creation of matter ex nihilo. But he suggests that there can be no such idea. Although he says that he wishes to defend theism, what he actually does here and elsewhere is to undermine it. Apart from such internal evidence for Collins's atheism, there is also important external evidence from George Berkeley, who claimed to have heard Collins say that he had found a proof for the nonexistence of God.

In 1713 Collins issued his best-known work, the *Discourse of Freethinking*, which continues his defense of reason by opposing restrictions on intellectual inquiry. The *Discourse* drew replies from Richard Steele, Jonathan Swift, William Whiston, Benjamin Hoadley, Berkeley, Francis Hare, and, most notably, Richard Bentley, who was said to have crushed Collins. There is some debate, however, about where the victory lies. In *Dynamics of Religion* John Mackinnon ROBERTSON vigorously champions Collins; more recently the older view has been endorsed by James O'Higgins in his informative study of Collins. However, Father O'Higgins—who dismisses the atheistic interpretation—tends to overrate Collins's opponents, particularly Bentley and Clarke. Soon after publication of the *Discourse*, Collins left England for his second visit to the Continent; rumor had it that he was forced to flee England by the threatening reception of his book.

Collins's next book, his classic defense of determinism, *Philosophical Inquiry concerning Human Liberty*, appeared in 1717. In this model of clarity and succinctness, Collins united the psychic determinism of Locke with the metaphysical determinism of Thomas HOBBES and Baruch SPINOZA. The *Philosophical Inquiry* was warmly praised by VOLTAIRE, Joseph Priestley (who reprinted it in 1790), Dugald Stewart, and the French atheists. This, *The Answer*, and *Vindication* are now the most readable and relevant of Collins's works.

Historical Work. After this, Collins's writing becomes more historical. Between 1720 and 1721 he collaborated with John Trenchard and Thomas Gordon on the periodical paper the *Independent Whig*, which Francis Squire described as "the most absurdly witty, profanely serious, fallaciously plausible, and rhetoricaly nonsensical [work] that was ever printed." Most of Collins's articles criticize some form of priestcraft.

The Grounds and Reasons of the Christian Religion (1724), directed against messianic prophecies, is Collins's most important historical work. As he noted in the sequel, *The Scheme of Literal Prophecy Considered* (1726), *The Grounds* elicited no less than thirty-five replying books and pamphlets. Here Collins opposed the prevailing view that theological doctrines could have the force of scientific statements without having to comply with the rigorous conditions of such statements.

Before Collins's critique, apologists tended to conflate

literal and symbolic fulfillment of the Old Testament prophecies. He argued that none of the prophecies concerning the Messiah could have been literally accomplished by Jesus, as described in the New Testament, since most of them could be shown to be about events that occurred many years before his birth. As there was no literal fulfillment of the messianic prophecies, and as the authenticity of the New Testament depends, Collins claims, on this literal fulfillment, the conclusion would seem to be that the New Testament is not authentic. However, this is not the conclusion Collins draws. He says that the New Testament is authentic because it contains symbolic fulfillment of the Old Testament prophecies. However, no commentator has taken him at his word. The works Collins published later—*Letter to the Author of the* Grounds (1726) and *Letter to Rogers* (1727)—are related to the prophecies debate.

Collins never articulated an original or well-rounded philosophy. His forte lay in developing, combining, and applying the radical doctrines of his predecessors, notably Locke, Spinoza, John Tillotson, Hobbes, and Bayle.

An obituary notice claimed that Collins said on his deathbed that he "was persuaded that he was going to that place which God had designed for those that love him." But it is hard to take such a statement seriously (see DEATHBED CLAIMS CONCERNING UNBELIEVERS). As we have seen, Collins did not believe (as deists are supposed to) that unaided reason could prove we were immortal. He said he believed in supernatural immortality; indeed, in the *Discourse of Freethinking* he asserts: "[T]he true Principles upon which immortality of the soul depends, are only to be fetched from the New Testament." But since it is generally agreed that he did not believe that the New Testament was divinely inspired, and that he had done much to undermine its authority in *The Grounds*, it does not appear that he had any basis for being "persuaded" of an afterlife.

While opinions differ concerning the extent of Collins's unbelief, there is universal agreement on his high moral character. Thus, the pious Lord Egmont, who "knew him and have eat with him," writes of Collins in an unpublished memoir: "In a word, his worst enemies could not charge him with immorality, nor his best friends acknowledge him a Christian." Egmont reports that Collins said, "I perceive myself the only man who believes nothing yet acts morally honest, while all my friends are by their scandalous lives a reproach to unbelief." Much of Collins's largely uneventful life was spent in rural Essex, either tending his ample estates (about twenty thousand acres) and his magnificent library (more than seven thousand volumes), or conscientiously discharging the duties of a county justice and treasurer.

Two essays by Collins appeared posthumously in the *Independent Whig* (1732): one on mystery, the other on religious authority. It is fairly certain that he was responsible, or largely responsible, for the 1741 annotated edition of CICERO's *Treatise on the Nature of the Gods*, which anticipates, in some measure, David HUME's argument against miracles. A work published in 1729, *Discourse concerning Ridicule and Irony*, has also been attributed to Collins.

DAVID BERMAN

COLLINS, WILLIAM WHITEHOUSE (1853–1923), English-Australasian lecturer and editor. A prominent freethinker in three countries (see FREETHOUGHT), William Collins was exceptionally efficient, courteous, and popular.

Son of a well-to-do manufacturer, Collins was born on September 4, 1853, at Harbourne, Staffordshire, England, and educated in science and philosophy at Mason College, Birmingham. Intended for the Baptist ministry, he gravitated to commerce, worked in his father's office, and moved to London. At Science and Art Department classes in the NATIONAL SECULAR SOCIETY's Hall of Science under Edward Bibbins AVELING, he lost all religious beliefs and embraced the radical political and social program of Charles BRADLAUGH and Annie BESANT. Joining the society, he became an accredited lecturer in 1884 and lifetime vice president in 1885.

In 1885 the Australasian Secular Association invited him to Australia. After a Melbourne induction with Joseph SYMES, William Willis—the association's Sydney president—formally invited Collins to relocate there as resident lecturer. In 1886 Collins began a weekly, *Freethinker and New South Wales Reformer*, which soon merged with Symes's *LIBERATOR*. He also married the daughter of a leading freethinker, Ebenezer Skinner. In 1887 Collins lost his main source of income when Sunday lectures in theaters in New South Wales were

banned, so he went on lecture tours round Queensland, New South Wales, Victoria, and Tasmania. For selling Besant's 1877 contraceptive booklet *The Law of Population* (see BIRTH CONTROL AND UNBELIEF) in 1888 he was fined five pounds, but was acquitted on appeal. In 1889 he launched a monthly, *Freedom: An Advocate of Social Political and Religious Liberty*, which ran a year. Then he left on a lecture tour of Tasmania and New Zealand.

His New Zealand tour began in Dunedin and ended in Christchurch, where the Canterbury Freethought Association (CFA) invited him to become secretary-lecturer. In 1893 he returned to Sydney to revive its ailing secularist movement, but soon returned to Christchurch to successfully contest a parliamentary election. He lost his seat in 1896, regained it in 1899, but lost again in 1902 and 1905. Throughout this period his debates on religion and morality and lectures on evolution (see EVOLUTION AND UNBELIEF) and astronomy continued uninterruptedly; and he published a monthly, *Tribune* (1894–95).

With his monthly *Examiner* (1907–17), conversion of the CFA into the New Zealand Rationalist Association (1909), and countrywide lecturing, he labored to establish a national movement. It slumped when he returned to Sydney in 1918, became president of the Rationalist Association of New South Wales, and died on April 12, 1923.

DAVID TRIBE

COLMAN, LUCY (1818–1906), American abolitionist and FREETHOUGHT activist. Lucy Colman was born at Sturbridge, Massachusetts. Opposed to slavery and skeptical of religion from her teens, she joined the Universalists (see UNIVERSALISM TO 1961). Twice married, through research she discovered that the legal rights of married women were scarcely broader than those of slaves and took as her cause the emancipation of slaves *and* women.

By 1852 she renounced Christianity, taking up Spiritualism (see SPIRITUALISM AND UNBELIEF). In that year her second husband died. Few jobs being open to women, she accepted employment as a teacher in a "colored school" in Rochester, New York. Repulsed by its segregation, she quietly lobbied parents to withdraw their children; the school closed within a year. A fellow teacher had been future suffrage leader Susan B. Anthony (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF), who arranged for Colman to address a state teacher's convention regarding her controversial opposition to corporal punishment. When a questioner objected that the Bible endorsed corporal punishment, Colman replied that nineteenth-century civilization had outgrown the Bible. The resulting controversy built Colman's reputation; she became a full-time abolitionist and a speaker with a special gift for silencing Christian hecklers. Challenged by a minister for speaking in public with her head uncovered, both forbidden to women by the Bible, she demanded to know why he appeared in public clean-shaven, quoting a scriptural passage admonishing men not to trim their beards.

In 1862 Colman's only daughter died at seventeen. Refusing a Universalist service, Colman opted for a more secular funeral conducted by Frederick DOUGLASS. She moved to Washington, DC, where she orchestrated and attended an unsatisfactory meeting between Abraham Lincoln and the black evangelist-reformer Sojourner Truth. (A later meeting between Colman, Truth, and Lincoln's successor as president, Andrew Johnson, was more successful.)

Having broken with Spiritualism, Colman embraced freethought. She addressed numerous conventions and contributed regularly to movement papers including the *BOSTON INVESTIGATOR* and *THE TRUTH SEEKER.* She moved to Syracuse, New York.

She participated in the 1878 freethinkers' convention in Watkins (now Watkins Glen), New York, at which *Truth Seeker* publisher D. M. BENNETT and activists Josephine Tilton and W. S. Bell were arrested for selling the free-love pamphlet *Cupid's Yokes* (see SEX RADICALISM AND UNBELIEF; HEYWOOD, EZRA; COMSTOCK, ANTHONY, AND UNBELIEF). Colman paid Tilton's bail and campaigned for the trio's acquittal (the case expired without trial) while continuing her women's rights work. Also in 1878, at a meeting of the National Woman Suffrage Association, she offered a resolution indicting religion as the primary agent of woman's subjugation. Frederick Douglass rose to contend that self-sacrifice was good for women; according to a contemporary account, Colman cited Douglass's own principles to argue him into silence. Her proposition was adopted.

In 1891 Colman published her autobiography, *Reminiscences.* She died at Syracuse on January 18, 1906, aged eighty-eight.

TOM FLYNN

COMSTOCK, ANTHONY, AND UNBELIEF (1844–1915), American Protestant antivice crusader. This famous Christian fundamentalist, counted among the "monsters of creation" by critics of his moral crusades, was described as follows by his victim Ida CRADDOCK in her 1902 suicide note: "The man is a sex pervert: he is what physicians term a sadist—namely a person in whom the impulses of cruelty arise concurrently with the stirring of sex emotion. The sadist finds keen delight in inflicting either physical cruelty or mental humiliation upon the source of that emotion."

Born on March 7, 1844, at New Canaan, Connecticut, the son of Polly Lockwood and Thomas Anthony Comstock was of Puritan (Congregational) stock. This farm boy of sturdy health had six siblings. From his mother he learned religion, the obsession he would later impose upon millions of people. Comstock's life is simply a long list of crusades against evil, ranging from gambling to the discussion of sex, to abortion, or any criticism of Christianity. At age eighteen he shot rabid dogs and destroyed a whiskey still near Winnipauk, Connecticut. As an enlisted man serving in the Union Army for the last eighteen months of the Civil War, he found Protestant ministers who would preach to his regiment and organized countless prayer meetings. In St. Augustine, Florida, he was made the lay head of an Episcopal church, and he became unpopular for refusing to allow fellow soldiers to use the church for "singing and pleasure." His 1864 diaries describe his campmates wrecking his bed and gear in response to his strident piety.

After the war Comstock worked as a clerk in the dry goods business and became involved with the Young Men's Christian Association (YMCA) in New York. After a few years he settled in Brooklyn. The great cause of the YMCA was then the recreational behavior of young men during nonworking hours, which included gambling, drinking at saloons with "pretty waiter girls," not attending prayer meetings, and reading what was considered to be obscene literature. Comstsock believed that these erotic publications were "feeders of brothels," and that obscenity and drunkenness were "twin devils." He married Margaret Hamilton in 1871.

Not yet able to make arrests himself, Comstock arranged them, initially targeting the retail merchants of offending materials. He would buy a questionable item and take it to a police magistrate as evidence for a complaint. When the YMCA began financing his efforts as its Committee for the Suppression of Vice (which later became an independent society), he escalated his campaign by targeting publishers and the express drivers who transported the stock and printing plates. It is at this point that Comstock began to display the blind cruelty with which he practiced his Christianity. He would announce as achievements the deaths of his prey, by suicide or odd accident, in his public addresses.

Comstock arranged for the arrest of the spiritualist and feminist Victoria Woodhull and her sister, Tennessee Claflin, in 1872 for exposing a love affair between Reverend Henry Ward Beecher and Elizabeth Tilton, the wife of another preacher. The sisters spent a month in jail; while free on bail, they began slamming Comstock in yet another issue of their newspaper. Woodhull was rearrested, in an early example of countless cases in which the great moral crusader attacked people simply because they criticized his moral crusades, though also to protect the image of pious society. As Woodhull pointed out at the time, items in her newspaper that Comstock described as obscene had appeared in dozens of other newspapers, but Comstock attacked only hers. Woodhull's Spiritualism was another reason for her peculiar victimization by Comstock (see SPIRITUALISM AND UNBELIEF). It was partly because he failed to convict Woodhull that his case for a federal obscenity law was strengthened when he later brought his crusade to Washington.

In 1872 Comstock and wealthy backers from the YMCA founded the New York Society for the Suppression of Vice. There was a similar society based in Boston, and virtually all of the members of both were millionaires, in the social register, professionals, or businessmen. But Comstock's antivice movement was noticeably weaker in those US cities where it was unable to establish in the public mind that obscenity threatened the well-being of children, Philadelphia being one example. However, even in Philadelphia or in remote rural towns, Comstock did harm to people who expressed alternative opinions on women's rights, sexuality, contraception, abortion, marriage, and other topics of public interest (see BIRTH CONTROL AND UNBELIEF; SEX RADICALISM AND UNBELIEF; SOCIALISM AND UNBELIEF).

Comstock's actual authority as an arbiter of public morals originated with the Act for the Suppression of Trade in, and the Circulation of Obscene Literature and Articles of Immoral Use, which became known as the Comstock Act, passed by the US Congress on March 1, 1873. The law authorized him as a special agent of the US Post Office and gave him police powers to seize obscene or otherwise immoral materials and arrest those who sent them through the mail. This was the first federal obscenity law passed by the Congress, preceded by heavy lobbying by Comstock and a public exhibition of "obscene materials" such as dime novels and contraceptives. This exhibition, along with an unfavorable display of Spiritualist literature, was authorized by US vice president Schuyler Colfax.

In the preceding years, there had been a widespread public campaign against abortion, a common practice before the Civil War. Simultaneous with the lobbying and passage of the Comstock Act there unfolded an infamous corruption scandal involving the railroad

financing company Credit Mobilier, which implicated many members of Congress as well as Vice President Colfax. In the wake of that scandal, Comstock took advantage of the outcry for morals in public life, but he redirected the finger of blame at ordinary citizens. There was an extremely serious economic depression at the time, and so the moment was perfect to create a law that improved the image of politicians. Also coinciding was the beginning of the modern era in Protestant revivalism, led by Dwight L. Moody and his singer, Ira D. Sankey. Moody bluntly indicated that his own message was God's message, and that all who "speak not according to this word, it is because there is no light in them." These extremely successful revivalists met in the very same YMCA that nurtured Anthony Comstock.

Two of Comstock's most famous arrests were made in November 1877. First was Ezra HEYWOOD, the free-love leader and anarchist (see ANARCHISM), for his birth control tract *Cupid's Yokes* and another piece called *Sexual Physiology*. Comstock physically seized Heywood during a convention, where he reported to have "looked over the audience of about 250 men and boys. I could see lust on every face." During the ensuing trial, the abject fraud of Comstockery, as his ideology was called, was brought to light. The court refused to allow the jury to see or hear any part of the offending texts. The defense was permitted neither to explain the publications nor to call any witnesses. The only admissible question was whether the texts had been mailed, while all of Comstock's assertions as to their obscenity were accepted without discussion. This routine would be repeated in countless cases throughout the vice hunter's long career. Heywood was sentenced to two years in prison and fined one hundred dollars. The Heywood family lost its home to foreclosure in the economic disaster of Ezra's conviction.

A week after Heywood's arrest, the editor of the leading freethought paper *THE TRUTH SEEKER*, D. M. Bennett, was arrested for sending two texts, including one by himself, "An Open Letter to Jesus Christ." A Comstock decoy letter had prompted the mailing. Bennett's case drew much attention and increased the circulation of his paper, which carried articles and letters attacking Comstock's tactics and motives. This first case ended in an acquittal, but Bennett was soon rearrested, fined three hundred dollars, and imprisoned for thirteen months for having distributed Heywood's book *Cupid's Yokes*. The ruling on this occasion by Judge Samuel Blatchford would serve as the standard in obscenity cases in the United States for fifty years. It relieved the court of any need to spell out on the record just what was obscene about the material in question.

Attacks upon Comstock and his crusade were numerous. In 1875 James Conroy, arrested for publishing obscene literature, drew a knife and slashed Comstock's face and head severely. On May 9, 1878, Comstock arrested a physician named Sarah Blakeslee Chase for a violation of the act. Chase was held for court, but after a grand jury found Comstock's case to be bogus, Chase had Comstock arrested at his office by sheriffs in New York on June 25, charging that he had arrested her "maliciously, and without proper cause." Her arrest had involved the ransacking of Chase's own and her tenants' apartments, and had caused her public disgrace as well as major financial losses. Comstock posted bail for twenty-five hundred dollars and was released.

In 1879 the pious Christian was charged with assault when he manhandled Fanny Hoffman in New York, demanding to know if she had written some intercepted letters and physically preventing her from summoning a policeman. Comstock and an assistant had cornered the woman in her home and refused to identify themselves, causing her to become alarmed. A magistrate named Pool humiliated Comstock in 1905, when the crusader arrested a dealer for allegedly obscene literature, but the magistrate was unable to find even the slightest suggestion of obscenity. When Comstock insisted that the issue was for him to decide, Pool shouted, "I don't want to hear it. Get out of this court."

Comstock received ridicule worldwide for his bizarre attacks against students and galleries of the fine arts. In one example, Comstock walked into the Art Students' League in New York and asked for a copy of *The American Student in Art*, then arrested the woman who had handed it to him and seized the entire stock of the journal. Art specialists everywhere were stunned, and students publicly jeered him. One student howled, "Why, if he were in Paris he would have been tossed in the Seine last night . . . that human moral mothball!" In other cases, only public amusement was the result, such as in 1888, when Comstock lectured at Princeton University and a statue on the campus called "The Gladiator" was provided with a red flannel garment, so as not to offend the famous prude's sensibilities. His raids on art dealerships in Philadelphia were dismal failures, with prosecutors flatly refusing to indict some of the defendants and all the cases resulting in acquittals.

It was a spectacle of corruption in public office that colored the banning of Lev TOLSTOY's newly translated novel *The Kreutzer Sonata* in July of 1890. The novel had been advance-ordered by the Philadelphia department store of John Wanamaker, but the publisher, anarchist Benjamin R. Tucker, replied that the store had missed the deadline for the early discount. It so happened that John Wanamaker was, at the time, US Postmaster General, and so he invoked the Comstock Act by declaring *The Kreutzer Sonata* unmailable on grounds of obscenity. In many American cities—though not in Philadelphia—Tucker humiliated Wanamaker in the daily papers. In Philadelphia, the postmaster general held far too much power over newspapers for his advertising revenue, for his standing as the leading lay Presbyterian, and quite a lot of raw political power as well. Editors of the *Boston Globe* (after pointing out that Tolstoy was perhaps the greatest living writer and a man of

eminently religious life) wrote, "Postmaster General Wanamaker has made a burro of himself. He ought to be called upon to resign an office which he makes both harmful and ridiculous." Before the affair was over, Philadelphia police prosecuted six street peddlers for selling the classic novel and jailed them.

Moses HARMAN was another important victim of the Comstock's ruthlessness. Comstock arrested Harman in 1886 for publishing a letter from W. G. Markland concerning the case of a woman who, while recovering from surgery relating to a childbirth, had been raped by her own husband, tearing open her sutures and bringing her near death. The arrest took place eight months after the letter appeared in the paper Harman edited, *Lucifer, The Light-Bearer.* His fellow editors E. C. Walker and George Harman were arrested as well, jointly facing 270 counts of obscenity. After court battles lasting four years, they were acquitted. In 1890 Harman published a letter by the New York physician Richard V. O'Neill discussing sexual abuse he had seen within marriages that had resulted in injury or death. The letter included discussion of oral sex and sex between humans and farm animals. The trial and sentencing make a complicated tale, but with the new charge for the O'Neill letter and a resurrected charge regarding the Markland letter, Moses Harman was sentenced to five years in prison. The saga was repeated in 1905, when Harman was seventy-five years old. Articles from *Lucifer* were chosen at random (including Dora Foster's "Sex Radicalism"). He was sentenced to one year at hard labor.

While Harman moved in and out of prison in 1891–92, an anarchist writer named Lois WAISBROOKER served as the editor of *Lucifer.* It came to her attention that the US Department of Agriculture had released a book titled *Special Report on Diseases of the Horse.* While nothing in the book would surprise, much less offend, any farmer, Waisbrooker knew that if the same terms and interest were used in describing human organs, the Comstock Act would be invoked. So in an editorial, she quoted the government pamphlet verbatim, explaining that a horse's penis should be suspended in a sling if it is kicked by a mare or has been bruised by striking at the mare's thighs and failing to enter her. A postal inspector promptly charged *Lucifer* and the sixty-six-year-old Waisbrooker. It was the first of her three arrests under the Comstock Act.

Elizabeth ("Elmina") Drake SLENKER, a sex radical of the remote mountain village of Snowville, Virginia, was arrested in 1887 under the Comstock Act. After a long career as a feminist and free-love writer, she was contributing articles and advice in *Lucifer.* Slenker's opinions were not at all extreme (advocating sexual abstinence except for procreation and being involved in the Social Purity Movement). Her arrest for the possession of "ring letters" (soliciting opinions on sexual questions from people of all classes and walks of life) and other literature resulted in a dramatic trial. Defending herself without a lawyer, she declared herself a materialist and refused to swear on the Bible, as she disbelieved in God and Christianity. By this time "Aunt Elmina" was a working grandmother who had a harelip, but she defended her work in sex education as a service to humanity and the so-called obscene literature as scientific material on medicine and surgery. She was acquitted.

A few campaigns were launched during Comstock's career to have him fired for taking bribes, but never with success. It is without doubt that by the beginning of the twentieth century this soldier of Christian decency had earned the reputation of a callous, brutal, and power-drunk religious extremist who was out of touch with the times. During the course of the trial of William Sanger for disseminating his wife Margaret SANGER's pamphlet *Family Limitation*, Comstock died September 21, 1915, of pneumonia. His cadaver was put into a hole at Brooklyn, New York.

ROBERT P. HELMS

COMTE, AUGUSTE (1798–1857), French philosopher. Auguste Comte is credited as the founder of sociology, and was a staunch proponent of POSITIVISM. In the fourth volume of his *Course of Positive Philosophy*, Comte proposed the word *sociology* (a hybrid term compounded of Latin and Greek parts) for his new positivist science. Comte believed that the reorganization of French society following the French Revolution would require intellectual reform. He hoped to replace religious dogma, especially Catholicism, with his positive philosophy, hence *positivism*. Comte's idea of positivism is based on the idea that everything in society is observable and subject to patterns or laws. Positivism was a way of explaining phenomena apart from supernatural (religious) or speculative causes.

Early Life. Isidore Auguste Marie Francois Xavier Comte was born January 19, 1798, in the southern French city of Montpellier during the most violent phase of the French Revolution. Long after his childhood and while living in Paris, Comte decided to call himself Auguste. His father, Louis-Auguste, was a humble employee of a tax office, and was well respected by his acquaintances. Louis-Auguste married Felicite Rosalie Boyer in 1797 in a secret Catholic ceremony. The revolutionary government had closed the churches of Montpellier, and consequently the Comtes had to hide their religious practices. Both Louis and Felicite were conservatives, which in that time and place meant Catholic and Royalist. The Comtes had three other children, Alix in 1800, Hernance (who died in infancy) in 1801, and Adolphe in 1802.

At age nine, Auguste entered lycée at Montpellier. Under Napoleon's rule, the lycées were boarding schools that served as training grounds for future soldiers and civil servants of the empire. Auguste excelled at academic pursuits and his photographic memory astounded his classmates and teachers alike. He could repeat hundreds of lines of verse after one hearing, and could recite backwards all the words on a page that he had read but once. A math teacher, a former Protestant pastor named Daniel Encontre, impressed Auguste the most. (His knowledge of mathematics would help him in his latter years when he attempted to establish the validity of the existence of "laws" in society.) At age sixteen, Auguste entered the École Polytechnique, a school for the advanced sciences in Paris. In 1816 he led a protest of students against the teaching methods of a geometry instructor. The new conservative government ordered Comte and his whole class removed for their rebelliousness. This expulsion would have a lasting negative effect on Comte's academic career, as he never earned a college-level degree.

Claude Henri Saint-Simon. Comte insisted that his positivism developed naturally, but he was deeply influenced by the work of French utopian socialist Claude-Henri Saint-Simon. In 1817 Comte became Saint-Simon's secretary and developed a protégé-mentor relationship. At this time Saint-Simon was busy publishing the third volume of his work *L'Industrie.* Comte served as secretary and collaborator. Part 1 of this publication demonstrated how the idea of God, the explanation of nature, and morality, as proposed by the church, had been disproven by the critical ideas of the Enlightenment. Part 2 articulated a system of "positive ideas," including a philosophy without God, the "true" science of nature, and a world morality guided by liberal politics. The positivistic ideas of Saint-Simon and Comte were to be coordinated in a new *Encyclopedia of Positive Ideas*, but the financial backers of this project found the content too radical and withdrew their support. For seven years Comte and Saint-Simon collaborated on a number of projects until Comte broke from the master over a quarrel involving publication rights and intellectual issues.

The Law of Three Stages. Comte's Law of Three Stages was influenced by Saint-Simon, who had argued that changes in social organization take place (and are necessary) because of the development of human intelligence. He believed that there was a direct relation between ideas and social organization—the former influenced the latter. Thus, scientific study should be directed at the moral ideas of a society in a given point in time. Saint-Simon claimed that there were three distinct periods in western European history that were influenced by moral ideals (with each system being replaced by the next). These systems were: (1) Supernatural-Polytheistic (the belief of supernatural powers and multiple gods), established by the ancient Greeks and Romans; (2) Christian Theism (Socratic science, belief in one God), existing during the Middle Ages; and (3) Positivism (belief in science and rational thought), beginning with industrialization. Comte's evolutionary theory on societal development was centered on his belief that progress was a matter of the growth of the human mind. He reasoned that the human mind evolved through stages and so too, he proposed, must society. Like Saint-Simon, Comte stated that there were three different stages: (1) theological (reliance on supernatural or religious explanations to explain what man otherwise could not), a stage that hampered intellectual development; (2) metaphysical (the belief that mysterious forces control behavior), a transitionary stage that witnessed the devel-

opment of abstract thinking; and (3) positive (the belief that laws of human behavior exist and can be discovered through observation and the use of reason), the final stage of development highlighted by a reliance on science, rational thought, empirical laws, and observation. Comte's Law of Three Stages reflects his belief of social progress (an idea that had become quite popular in the eighteenth century) and the premise of human perfectibility—a term that refers to an ongoing process, not to some utopian ideal for individuals or for society.

Positive Philosophy. Comte believed that the object of all true philosophy is to frame a system that would comprehend human life under every aspect, social as well as individual. The role of the philosopher, then, is to understand the various elements of man's existence so that it may be conceived of theoretically as an integral whole. The key to understanding human behavior is to separate the subjective (e.g., beliefs) from the objective (facts). Comte insisted that the only reliable way of acquiring objective truth was through the methods of science. Knowledge based on scientific method was superior to metaphysical conjecture or theological assertion. Social positivists seek to discover social laws that will enable them to predict social behavior. Through observation of behavior a number of social relationships and arrangements should become identifiable as "facts" that can be separated from beliefs.

Comte was among the forerunners of the championing of positivism. Comte did not mean that human behavior was always subjected to these "laws"; rather, he saw positivism as a way of explaining phenomena apart from supernatural or speculative causes. Comte did believe that positivism would create theories based on factual information, evidence, and historical comparisons to predict future events. The discovery of basic laws of human behavior would allow for deliberate courses of action on the part of both individuals and society. Decision making, guided by science, would be positive. Positivism, then, would be superior to supernatural, philosophical, or religious explanations of human behavior. Comte viewed positivism as both a philosophy and a polity that must go hand in hand, the former being the basis of change and the latter as the comprehensive system to coordinate it. Morality forms the connecting link between philosophy and politics and at the same time draws the line of demarcation between them.

Positivism is grounded by a fundamental belief that there is an existing order of the universe and that the cause of every phenomenon is natural, not supernatural. Comte firmly believed that there are invariant laws of the social world and that the task of social thinkers is to discover those laws. His idea that social sciences should be grounded by empirical positivism remains a cornerstone of contemporary inquiry. Unfortunately, Comte's attempt in his later life to establish the "Religion of Humanity" (with a "positivistic church"), with himself as the "High Priest," clouded his otherwise lasting contribution to the search for scientific truth in the face of religious dogma.

TIM DELANEY

CONDORCET, MARIE JEAN ANTOINE NICOLAS CARITAT DE (1743–1794), French philosopher and politician. Marie Jean Antoine Nicolas Caritat de Condorcet was born on September 17, 1743, at Ribemont in Picardie (northern France), into a noble family of modest means. He was educated by his mother in a very strict Catholic tradition. He soon became sharply critical of the severe training he received in a Jesuit-run school whose entire program of studies was dominated by theological considerations. He complained of pedagogy under which "one learns by heart what one does not understand," guided by an absurd view of morality that "teaches the children that one cannot do good without divine grace." In his teens he became convinced that ATHEISM and science were the way he would follow.

In 1765 he published his first important essay on integral calculus, attracting the admiration of the famous mathematician d'Alembert, who is also (with Denis DIDEROT) the primary force behind the magisterial *Encyclopédie* (see *ENCYCLOPÉDIE, L'*, AND UNBELIEF). At twenty-seven, Condorcet was elected to the French Academy of Sciences. Soon he formed acquaintances throughout learned society, including, of course, d'Alembert and all his many close friends: the economist Jacques Turgot, the famous socialite and hostess of salons Julie de Lespinasse, and of course the great encyclopedists, Denis Diderot, Étienne de Condillac, the jurist Chrétien Guillaume de Malesherbes, and others. Condorcet can thus be considered the last of the Encyclopedists. He met VOLTAIRE, whose battles for human rights impressed Condorcet indelibly after a few days spent with Voltaire at his home in Ferney.

Condorcet felt great revulsion at the widespread injustices of the Old Regime, and won regard for his natural benevolence, the purity of his enthusiasms, and his almost prophetic social views. He became close to the atheists Baron d'HOLBACH and HELVÉTIUS, and to the "Lodge of the Nine Sisters," a freethinking Masonic lodge in Paris (see FRANCE, UNBELIEF IN). He also befriended the Americans who at various times resided in Paris: Benjamin FRANKLIN, Thomas PAINE, and Thomas JEFFERSON. Under an assumed name he wrote the violently anticlerical *Letters of a Theologian*, and wrote the *Almanac against Superstitions* in which he charged that "[t]he Catholic religion is abominable, if only because it changes men into wild animals of whom priests orient the furor at their will." In 1773 Condorcet was named to the Secretariat of the Academy of Sciences (he would be named its perpetual secretary in 1776).

Condorcet was now a man of influence. His friend Turgot became minister of Louis XVI, a position of immense power. Condorcet became inspector of the Mint. For an interval he could imagine that the Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE) stood victorious.

But his friend Turgot reached too far, issuing edicts in 1776 that dissolved the guild system, ended a tax of labor upon peasants, and instituted a single tax on land. Turgot's disgrace and dismissal would open a new phase in Condorcet's life. More and more disturbed at the state of public affairs, he argued openly with Jacques Necker, the new minister of finances, whom he hated. Meanwhile he continued to pursue his humanist activities. In 1781 he was elected to the Académie Française, the most prestigious academy of all. He embraced reform causes, fighting for the abolition of slavery, for the civil rights of Protestants and Jews, for women's right to vote, and against all sorts of then-popular obscurantisms.

In 1786 he married; his wife, Sophie, opened a salon frequented by Beccaria, Jefferson, Paine, La Fayette, and Beaumarchais. Concepts like revolutionary doctrine and the separation of church and state were freely discussed. Condorcet developed his ideas on democracy in an influential essay, "The Provincial Parliaments" (1787).

The French Revolution exploded in 1789. Condorcet befriended Emmanuel Joseph Sieyès, a revolutionary leader. Full of expectations, Condorcet became more active than ever. Entering politics, he drafted the Declaration of Human Rights (1789) and supported the 1791 (monarchic) constitution, though he found both insufficiently democratic in their final versions. Now a firm Republican, he was elected to the Legislative Assembly (of which he would become president in February 1792), then to the National Convention. At the same time he was indefatigable behind the scenes as a journalist and in drafting a vast number of reports and proposals.

At the beginning of 1792, he sided with the Girondins, a moderate Republican faction, but fought for unity among the then-dueling factions. He grew pessimistic in the face of the violent quarrels between the Girondins and their principal rivals, the Montagnards. Feeling isolated and lonely, he struggled in vain by means of many addresses and a notable journal, his *Chronique de Paris*, to convince other countries of the peaceful intentions of Revolutionary France—and to convince his colleagues to institute such economic measures as a minimum wage. He served on a nine-member committee charged with writing a draft (Republican) constitution; among the other members were Sieyès, Danton, and Paine. He often stood against majority sentiment; for example, during the trial of the king he openly opposed the death penalty. The proposed constitution, of which he had been the *rapporteur* or principal author, was not approved.

Condorcet then concentrated his energies on education reform. His splendid *Mémoires sur l'Instruction publique* of 1791 offered a prophetic plea for *LAÏCITÉ*, for coeducation, and generally for the democratization of education.

Meanwhile the Girondins were hurled from power; many were condemned and executed. Condorcet himself was accused of torpedoing the new constitution, so different from the one he had proposed. He escaped arrest and went into hiding from July 1793 to March 1794. At this time he wrote his most significant work, *A Sketch for an Historical Picture of the Progress of the Human Mind.* This was an enthusiastic, almost prophetic text, a rationalist manifesto that reflected the Enlightenment ideals of the Encyclopedists and which many could still endorse today. In it he denied any meaningful limits on human REASON and declared the perfectibility of humankind. Condemned to death in absentia, Condorcet was finally arrested on March 27, 1794, after an erratic manhunt. Two days later he was found dead in his cell. The manner of his death was never established; speculation ranged from suicide to a stroke to murder.

The last of the encyclopedists was also perhaps the first of the true democrats: firm in his rationalism, convincing in his atheism, and above all a devoted humanist.

JEAN-CLAUDE PECKER

CONFUCIANISM. It is impossible to reflect on any aspect of Chinese history, culture, or philosophy without reference to one of its oldest schools, Confucianism. Confucius, or K'ung-tzu (or K'ung-fu-tzu), lived from 551 to 479 BCE, and for centuries public life in China has reflected his teaching; in fact, his *Analects* still play a compulsory part in Chinese education. Some of the classical writings associated with him are known to be ascribed to him rather than actually his own, but they are consistent with his philosophy, which may be described as social HUMANISM.

The *Analects* were assembled by Confucius's students after his death, and in this work a number of key words

emerge, reflecting the values which Confucianism has emphasized over twenty-five hundred years.

Fundamental to all is *jen*, loving kindness or (in Kantian terms) goodwill. This means treating people both with respect and as ends in themselves; (to quote the Golden Rule, which Confucius stated centuries before it appeared in the New Testament) not doing to others what one would not wish to have done to oneself.

Then follows *yi* (or *i*), righteousness, meaning that in certain situations one acts in a particular way simply because it is the right thing to do. Motives of an action are more important than the results, and intentions have intrinsic value (again one can identify a parallel with Immanuel KANT.)

Two ways of practicing *jen* are *zhong*, conscientiousness, and *shu*, altruism, both of which are immediately recognizable qualities in a *Chun-tzu*, a gentleman or superior man. Until Confucius's time this meant a person of superior birth, but Confucius spoke of it as a quality that any morally mature person might evince. It is the opposite of sourness, or small-mindedness, a feature which applies in politics and society as well as in personal and family life: in fact, it would be folly to look for it in the public domain if it were not first manifested in the private.

A quality that expresses the essence of Chinese values is *li*, propriety. Originally it related to rites and liturgy, but Confucius applied it to social sensitivity and etiquette. It is the basis of the Chinese concern not to cause others to "lose face," even where disagreement exists between parties. It is a means of ensuring that amid the conflicts which inevitably occur between people, society and its relationships continue to function in a civilized way.

Linked with *li* is *xiao*, filial piety. Confucius argued that the best way to honor one's ancestors is to honor and respect one's parents; even after their deaths one can honor them more by seeking to fulfill their aims than by offering sacrifices to their spirits.

We thus see that Confucius stamped his philosophy with common sense and practical wisdom. He believed that errors in the social order (and he identified many) could best be rectified through education, whereby people could and should be taught to do the right thing. Through education, he believed, anyone could become a *Chun-tzu*, making *xiao* (filial piety) the key to his actions. Confucius advocated this virtue more than one's duty to the state: a feature of his teaching which the legalist school, two centuries after his death, tried to undermine.

Confucius did not expressly reject any kind of spiritual dimension in the world, but ignored any discussion of it. His successor, Mencius (Meng-tzu), followed his teaching in most respects, but not this one. Mencius taught that one could align one's life with the spiritual forces in the world—a concept influenced by another major Chinese philosophical tradition, Taoism (see TAOISM, UNBELIEF WITHIN).

However, Mencius's main contribution to Confucianism was his assertion that human nature is essentially good, but that society warps it (a view not dissimilar to that of Jean-Jacques ROUSSEAU). It was, he said, as natural for man to show *jen* as for water to flow downhill. On this issue he was opposed by the third master in the Confucian hierarchy, Hsun-tzu, who argued the reverse: man was born selfish, and it was only through the guidelines and directions which society inevitably imposed, particularly through education, that the mold of morality could shape him. He would have agreed with both ARISTOTLE and Thomas HOBBES that it is the function of government to make the people good.

After suffering the effects of legalism for some centuries (that is, until around the beginning of the third century CE), Confucianism was infiltrated by the other two philosophies which have directly influenced Chinese thinking and behavior: Buddhism (see BUDDHISM, UNBELIEF WITHIN) and Taoism. This process of syncretization continued for about five centuries, and is generally described as neo-Confucianism. It saw the emergence of the *I Ching*, or *Book of Changes*, as an aid to meditation (and sometimes divination), used by many Chinese on a daily basis. An important later exponent of this new expression of Confucianism was Chu Hsi who laid great stress on *li* as the cosmic principle which, he believed, provided a metaphysical rationale for traditional ethics—a view which would have mortified Confucius.

There are thus two ethical strands in Confucianism. One, associated with Confucius and Hsun-tzu, is conventionalistic: we ought to follow the traditional codes of behavior for their own sake. The other, associated with Mencius and medieval neo-Confucianism, is intuistic: we ought to behave as our moral natures—or the heavenly order—dictate.

After the neo-Confucian period, philosophical concepts again became central in Confucian teachings, and the classical writings, including the *Analects*, became essential reading for all potential civil servants (this continued to be the case until 1905). The significance of Confucianism is still recognized in China and taught in schools: In fact, Mao Tse-tung ranked Confucius alongside Karl MARX, Friedrich Engels, and Vladimir LENIN (though whether Confucius would have appreciated the comparison or not is a moot point). Thus Confucianism remains, like Hinduism to Indians, quintessentially Chinese.

RAY BILLINGTON

CONJURING AND BELIEF IN THE SUPERNATURAL. Conjuring, the stage magician's art, has frequently been employed by unscrupulous persons to foster belief in the supernatural. In return, conjurers like Harry Houdini have used their knowledge of trickery to uncover deceptions that often fool even scientists, since they are not trained to detect trickery.

Deception in the service of supernatural claims is

most ancient, early sorcerers not always having been as scrupulous as today's stage magicians to admit their wonders were accomplished by art rather than by occult powers. For example, the Westcar Papyrus in the British Museum (written circa 1500 BCE) tells of a wonderworker named Dedi who could restore severed heads. He tactfully declined Pharaoh Cheops's offer of a prisoner for the decapitation, instead using, in turn, a goose, pelican, and ox. (With birds the head could be tucked beneath a wing and a dummy head brought into view, the magician reversing the process to resurrect the bird. Walter Gibson suspects the feat with the ox was merely a boast, although there are many ways such a trick could have been accomplished.)

Along similar lines, there is the biblical story of the duel between Moses's brother, Aaron, and the pharaoh's sorcerers. The account (Exod. 7:8–13) tells how Aaron cast down his rod, whereupon it became a serpent. When the Egyptian magicians duplicated the feat, Aaron's snake swallowed theirs. Although the events of the Exodus are not supported by external historical sources and the snake-swallowing detail smacks of pious legend making, the rod-to-serpent effect may well have been "a standard item among Egyptian sorcerers." According to Gibson, "[T]here are reliable reports of modern Egyptian wizards who have performed a similar trick." A suitable snake could be cleverly substituted for a staff of comparable form to work the pretended miracle.

Legend and magical deceptions were often interrelated, and it is typically impossible to sort out the exact relationship between them. For instance, there are stories involving magical vases, such as the miraculously refilling cruse of oil that accompanies the Jewish story of Hanukkah, the container with which Moses transformed Nile water into blood (Exod. 4.9), and, of course, the stone jars of Jesus's water-to-wine miracle at Cana (John 2:5–10)—among others. There were ancient conjurers's vases that were capable of producing just such effects, but it is difficult to know whether tricks with them prompted the legendary tales, or whether the stories instead inspired the creation of tricks to illustrate them (such as by today's "gospel magicians")—or whether the relationship between the tales and the vases is even more complex.

A stark example of magical deception is related in the fourteenth chapter of Daniel (in the Apocrypha), concerning a supernatural effigy. The Babylonian idol of Bel (or Baal) not only drank large quantities of water but also devoured vast amounts of food. By this seeming miracle the priests won over King Cyrus to the worship of Bel. Daniel, however, was skeptical, and so a test was arranged. Cyrus had the food and wine set forth as usual but sealed the door to prevent surreptitious entry.

The following morning the seals were intact yet the food and wine were gone. Cyrus believed a miracle had occurred, but Daniel called attention to the floor, which his servants had secretly covered with sifted ashes. Thus were revealed "the footsteps of men and women and children"—those of the priests and their families—which led to "the secret doors through which they were accustomed to enter and devour what was on the table."

Although this story may be merely a pious legend, it could have been inspired by temple trickery that is known to have existed, and it no doubt helped to motivate Jews to resist idolatry. It can also be appreciated as a model of critical thinking—what the *New Catholic Encyclopedia* calls "clever detective work" from ancient times.

A milestone in skepticism was Reginald Scot's 1584 *The Discoverie of Witchcraft*. Scot set out to demonstrate that witchcraft was a fiction, and that the black arts—including soothsaying, astrology, exorcism, spell casting, and the like—depended not upon supernatural forces but rather on trickery or skill. His treatise explains many of the secrets of legerdemain, including, for instance, how "[t]o tell one without confederacie what card he thinketh." The implications of Scot's exposés were such that King James later branded them heretical and ordered that all copies of *The Discoverie of Witchcraft* be burned.

Concerning the biblical witch of Endor, who purportedly conjured up the ghost of Samuel at the request of Saul (1 Sam. 28:7–20), Scot was of the opinion that the endeavor was a sham. He concluded that the witch had not communicated with Samuel, that instead the effect was "contrived" by the "art and cunning" of the woman, without any "supernatural devices," probably, he theorized, by the use of ventriloquism.

Whereas the witch of Endor is described in the King James Bible as "a woman that hath a familiar spirit," in the revised standard version she is "a medium"—reflecting the present term for one who purportedly contacts spirits of the dead on behalf of the living. The modern wave of mediumship began in 1848 with the schoolgirl pranks of Maggie and Katie Fox at Hydesville, New York. Although four decades later the sisters confessed that the "spirit" rappings had been produced by trickery, in the meantime the phenomenon—eventually the religion—of spiritualism spread across America, Europe, and beyond. At séances held in darkened sitting rooms and auditoriums, mediums produced such physical phenomena as slate writing, spirit photography, and "materializations" of ghostly entities.

In time, however, mediums were repeatedly caught cheating. Magicians like John Nevil Maskelyne in England and later Harry Houdini in the United States attended séances and exposed deceptions. Maskelyne wrote a book, *Modern Spiritualism*, that exposed the methods of fake mediums. Later, after medium Henry Slade was arrested in London in 1876 for producing bogus "spirit" writing on slates, Maskelyne testified at his trial, enthralling those in attendance by performing each of Slade's tricks while standing in the witness box.

Maskelyne also produced on stage a levitation

inspired by the medium D. D. Home who, allegedly, in 1868 floated out an upstairs window of a house in Westminster and drifted in another. Although the witnesses have been discredited, and several simple means have been postulated to reproduce the effect by trickery, Maskelyne used Home's supposedly supernatural feat as the plot for a magician's illusion. Standing on stage at Egyptian Hall in London, he floated up to the top of the high-domed ceiling, in full view of the audience. Then, spotlighted, he turned and—as Home had done—floated horizontally back to the front of the stage.

Houdini (born Erich Weiss) crusaded against phony spiritualists during the latter part of his career. He befriended elderly mediums who, in return, taught the master deceiver the secrets of their own deceptions. Houdini also attended séances—occasionally in disguise—to learn secrets and uncover trickery. Sometimes during séances he would take advantage of the darkness to secretly place lampblack on a spirit trumpet, which would subsequently be found on the medium's hands and so prove it was not spirits who had "levitated" it. On some occasions, the magician would turn on a flashlight to catch a faker.

In the 1920s Houdini gave public demonstrations of spiritualist deceptions. "Do Spirits Return?" asked one of his posters. "Houdini Says No—and Proves It." On stage the nemesis of phony spiritualists sat at a draped table. While audience members held his hands and placed the toes of their shoes upon his, beneath the table a tambourine jangled, words were chalked on a slate, and a bell rang, signaling an end to the mock séance. An assistant then pulled the cloth aside, revealing that it was the magician's foot—slipped from its shoe and with the end of its stocking cut away—that had accomplished the effects.

Today, conjuring tricks are still being used to convince credulous folk of the reality of the supernatural. In the long tradition of Hindu holy men, for example, is Satha Sai Baba of India, the so-called man of miracles. Among his feats is the production of apports (objects allegedly materialized out of thin air or "teleported" from another place). His apports include *vibuti* (or "holy ash"), gold jewelry, religious statues, and other objects. Actually, films of Sai Baba's feats reveal that he is employing sleight of hand. Crusading against him and others of his ilk is the Indian conjurer B. Premanand, who differs from the Indian godmen only in his ready admission that he accomplishes his wonders by conjuring.

CONSEQUENTIALISM. In its broadest formulation, consequentialism is the view that the morality of an action depends only on its *consequences*, and not on conditions that obtained prior to the action, such as intentions or circumstances. The most famous example of consequentialism in ethics is the theory of classical utilitarianism, which received its canonical formulation from Jeremy BENTHAM, John Stuart MILL, and Henry Sidgwick. Classicial utilitarianism holds that an action is right when it maximizes happiness: that is, when the value of happiness for all minus the unhappiness for all resulting from the action is greater than the value of any other action available to the actor. However, as we will see, there are many consequentialist theories in normative ethics, and so the plausibility of consequentialism does not depend on the plausibility of classicial utilitarianism. Consequentialist ethics are often considered radical alternatives to traditional religious ethics that evaluate action on the basis of obedience to divine commandment or conformity to divinely authored natural law. More generally, consequentialism contradicts the deontological (that is, duty-based) character of most traditional ethical systems which evaluate action on the basis of some intrinsic properties of an action itself—such as good intentions or virtue—rather than its effects. Thus, throughout history, consequentialism of various sorts has been particularly attractive to skeptics, nontheists, humanists, and philosophical naturalists.

To appreciate the general motivation for consequentialism, we must first distinguish two components that any reasonably comprehensive moral framework will include, if sometimes only implicitly: a theory of the good and a theory of the right. A theory of the good is a view about what kinds of things are morally valuable, what kinds of properties are desirable in our actions or in the world. For example, natural law doctrine asserts the value of our natural proper functions; Kantian deontology (see KANT, IMMANUEL) asserts the value of the goodwill; Bentham's utilitarianism insists that pleasure is the only intrinsic value. A theory of the right is a view about how we ought to behave so as to properly respond to such values. There are at least two ways one could

respond to a moral value (if such a thing exists). One way is to protect it, or honor it; to keep it from being somehow violated or lost. Another way is to promote it, to act so as to bring about more of the value where possible. Another way to construe consequentialism is to say that whatever one's theory of the moral good, the proper response to that good is to promote it.

It can be argued that consequentialist theories have general advantages over nonconsequentialist theories in virtue of their superior theoretical simplicity and coherence with background knowledge. Everyone, including nonconsequentialists, would agree that there are at least *some* sorts of goods to which the proper response (if they are in fact goods) is to promote them: for instance, personal hygiene, health, or education. Consequentialism suggests that this single kind of appropriate response applies to goods of all sorts, including moral goods, whereas nonconsequentialism must maintain that there are some sorts of good for which promotion is not appropriate. But why should this be? Here the nonconsequentialist needs to present an account that distinguishes values to be protected from values to be promoted in some non–ad hoc way. This challenge is most clear in the case of deontological prohibitions on certain classes of action. Consider an action of type *A*, which some deontological theory classifies as wrong and prohibited. Suppose that by committing a single instance of *A*, an agent could bring about a situation in which far fewer instances of *A* take place. How is it, if there is some property of *A* that constitutes its wrongness, that a moral agent could be indifferent to whether there are more or fewer actions that have this property? If killing is wrong, what reason can be given why we must refrain to kill, say, a ruler bent on genocide, even when by so refraining we help to bring about a situation in which more killing takes place? Consquentialism's account of moral normativity also coheres well with the dominant view of rational or prudential normativity, or so-called instrumental rationality. This is noteworthy because many leading moral theories claim that there is some kind of intimate link between rationality and morality. According to instrumentalism about rationality, the prudent thing to do is choose the best means to one's ends; that is, efficiently to promote one's own good. Nonconsequentialist accounts must explain why this extremely attractive approach to prudential goods—promoting them—cannot be extended to moral goods.

Having considered an important source of motivation for consequentialism, let's turn to some of the major objections against it. First, there are well-known objections to utilitarianism. Classical utilitarianism holds that individual happiness is the only intrinsic good. Yet we can easily imagine situations in which people experience the greatest degree of happiness but still appear to be missing some things that make a life go well. The philosopher Robert Nozick illustrated this point in a famous thought experiment called the Experience Machine. Imagine a machine that creates totally comprehensive and convincing experiences. In this perfect virtual reality simulator, you can be made to experience composing a symphony, marrying the person of your dreams, winning the Tour de France, or just spending all your days relaxing and enjoying fine food and entertainment. And yet you would have done none of these things. Nozick asks whether, given the choice, you would choose life in the Experience Machine over an actual life, with its risks and unhappiness. The thought experiment suggests that the experience of happiness is not the only intrinsic good. We also care about actually accomplishing things in the world, entering into relationships with other people, and so on. Consequentialists respond by pointing out that even if classical utilitarianism is implausible as a theory of the good, that does not show that consequentialism is inadequate as a theory of the right. The idea that morality consists in promoting the good might be correct even if it turns out that happiness is not that good.

An objection that takes aim at consequentialism itself is the objection from fairness or justice. Consider a situation in which there are two possible actions, *A* and *B*, that are exactly equal in their potential to maximize the good, whatever it might be. But *A* involves causing a significant injustice, such as falsely accusing someone of a crime, or breaking a promise, or taking someone's property without compensation. Nevertheless, according to consequentialism, it seems, *A* and *B* are morally equivalent. This conclusion flies in the face of our considered moral judgments. Our considered moral judgments, and much of the accumulated moral teachings of humanity, suggest that certain things should not be done to people even if doing them would produce a greater good. That is to say, people have rights. Relatedly, duties to others, such as those generated by the promises we make, are not supposed to be weighed against other values that could be promoted were the duties violated. Indeed, duties are morally important insofar as they serve as constraints on the promotion of goods. A way to generalize this objection is that consequentialism seems to ignore backward-looking reasons, reasons for acting that arise out of past events like promise making. For the consequentialist, the only morally relevant facts are facts about the future, namely, facts about the good, bad, and indifferent states of affairs that may result from an agent's choices. Again, consequentialism fails to capture this aspect of our everyday moral experience.

Another objection against consequentialism is that it is impracticable. The consequences of our actions are often highly unpredictable, so how can they serve as the criterion by which we morally evaluate our options? More troubling is a problem Daniel Dennett has called the Three Mile Island effect. Events have causal repercussions extending indefinitely into the future, so whether they promote the consequentialist's favorite good may be depend on the future point at

which one surveys those effects (consider the possibility that the Three Mile Island disaster eventually had the effect of improving the safety of America's energy supply and preventing similar disasters). How far into the future does consequentialism count, and why? Similarly, consequentialism has also been indicted as being too demanding. By treating everyone's good as equal, it asks the moral agents to overlook their special obligations to those with whom they have special relationships, such as children or spouses. Although one of two people caught in a burning building might be your daughter and the other might be a stranger to you, the consequentialist analysis appears incapable of accommodating the intuition that you have more reason to save your daughter than the stranger. Also, as philosophers such as Peter Singer, Peter Unger, and Tom Regan have argued, consequentialist ethics go much further than traditional ethics in obligating us to act on behalf of others' good, for example, by assisting faraway people suffering from famine or preventable disease, or forgoing the unnecessary consumption of animals for food or research. A common reaction to such suggestions is that morality simply cannot require that much of us.

Consequentialists have pursued two different general strategies in response to these objections. One strategy is to "bite the bullet" and insist that, in view of consequentialism's various theoretical advantages, the counterintuitive results it yields do not give us reasons to reject the theory but instead give us reasons to revise our conventional moral outlooks. If the most plausible moral theory on offer turns out to be "too demanding" or "unjust" by the lights of conventional ethics, so much the worse for conventional ethics. The other strategy is to distinguish between direct and indirect consequentialism, which can be appreciated by grasping the difference between a decision procedure and a criterion of rightness. A decision procedure is a pattern of reasoning or psychological disposition that tends to result in right action. A criterion of rightness states what makes it the case that an action is right. Consequentialisms contain an account of *what a right action consists in*—bringing about more good than any of the available options (or on "satisficing" versions, bringing about enough good). But consequentialisms can also contain accounts of *how to decide which action is right* (for a particular kind of agent in a particular situation). Given the cognitive and affective constraints of human nature and circumstance (such as highly imperfect knowledge of the probable results of our actions or certain kinds of emotional bias), there may be many situations in which we will be worse at promoting the good to the extent that we deliberately attempt to promote the good. By analogy, although the criterion for promoting a financial asset might be to maximize net investment returns over time, the best decision procedure might be to select an annuity with a diverse portfolio. One of the remarkable things about consequentialism is its theoretical flexibility with respect to decision procedures, which, like everything else in a consequentialist universe, are subject to evaluation in terms of their overall effect. This flexibility is exploited in defenses against the above objections. For example, it can be argued that we can best promote certain goods indirectly by recognizing some constraining rights or according special weight to the interests of one's friends and relatives. Indirect consequentialism is not the same as so-called rule consequentialism. Rule consequentialism is an alternative criterion of rightness: it says that right actions are those that comply with general rules whose adoption promotes the good. Therefore, rule consequentialism generates conflicts with consequentialism as such, which looks at whether each action maximizes. Indirect consequentialism likewise evaluates any given action on whether it maximizes. It just denies that the action will be successful only by aiming at maximizing. Considerable work in ethics is now being devoted to articulating a defensible indirect consequentialism.

AUSTIN DACEY

CONTROVERSIES: ATHEISM, PANTHEISM, SPINOZISM. The Atheism, Pantheism, and Spinozism controversies were a cluster of related religious and philosophical disputes that involved many of the most esteemed minds in late eighteenth- and early nineteenth-century Germany. The late eighteenth and early nineteenth centuries witnessed frequent disputes concerning faith and reason rooted in the German Enlightenment, or *Aufklärung* (see ENLIGHTENMENT, UNBELIEF DURING THE). The *Aufklärung* was characterized by an overweening confidence in reason. Its champions embraced critical thinking, individual autonomy, and religious tolerance. Although most agreed that enlightenment would foster human well-being manifest as unlimited intellectual, moral, and spiritual progress, many disagreed about how to promote this goal. Thus, unabashed fideism (reliance on individual faith as the ultimate criterion of truth) and romanticism flourished alongside detached SKEPTICISM, realism, and idealism. Perhaps inevitably, some children of the *Aufklärung* began to question the ultimate compatibility of human welfare and enlightenment and indeed, of human belief and knowledge.

The death of the *Aufklärer* Gotthold Ephraim LESSING initiated the *Spinozismusstreit*, or Spinozism Controversy, of 1783–87. Lessing's intimate of many years, the rational theist Moses Mendelssohn, had confided to their mutual friend, Elise Reimarus, that he intended to write a tribute to Lessing's character. Reimarus shared this information with the fideistic writer F. H. JACOBI, who revealed Lessing's "deathbed" confession that he had long followed Baruch SPINOZA's philosophy. This allegation wounded Mendelssohn insofar as it implied that Lessing had died a pantheist or even an atheist, that he

had doubted his best friend's confidence, and that he had regarded Jacobi as his intellectual heir. Soon, Reimarus was playing intermediary in a quarrel between Jacobi and Mendelssohn wherein each behaved dishonorably. The resulting fray attracted Immanuel KANT, Johann Gottfried von HERDER, Wizenmann, and Johann Wolfgang von GOETHE, among others. Before it ended, the rigors of the public debate led to Jacobi's physical decline and to Mendelssohn's and Wizenmann's deaths.

Ostensibly, the Spinozism Controversy concerned the theological implications of Lessing's alleged Spinozism. Mendelssohn allowed that Lessing followed Spinoza, but he argued that Spinozism constituted refined or purified pantheism, which maintains a separation of God and world. Jacobi exaggerated Lessing's commitment to Spinozism, which he claimed led to pantheism, or the identification of God with nature, and thus, to materialistic ATHEISM.

Actually, the Spinozism Controversy involved the question of whether reason or faith should have priority. Whereas Mendelssohn insisted that reason—moderated by common sense—could justify moral and religious beliefs, Jacobi maintained that abstract knowledge undermined trust in external reality, freedom, and God, which required a *salto mortale*, or mortal leap of faith. Although Kant denied any knowledge of the objects of faith, he defended the possibility of rational belief in God, freedom, and immortality. Wizenmann clarified the issues at stake by exposing tensions within Mendelssohn's "common sense," Jacobi's "faith," and Kant's "rational belief." After Mendelssohn's death, interest in Kant's transcendental idealism eclipsed concern over Lessing's Spinozism. Nonetheless, the battle over faith and knowledge would reappear during the *Atheismusstreit*, or Atheism Controversy, of 1798–99.

The Atheism Controversy involved the social, moral, and religious implications of transcendental idealism. It began with the publication of two essays, "On the Basis of Our Belief in a Divine Governance of the World" (1798) by J. G. FICHTE, a popular young idealist at the University of Jena, and "Development of the Concept of Religion" (1798) by F. K. Forberg. In 1799, protests by concerned citizens led Friedrich-August, prince-elector of Saxony, to ban the essays and to coerce Duke Karl-August of Weimar to reprimand the authors. Fichte responded with a fiery self-defense that received a deluge of recriminations and justifications from every camp. His erstwhile allies Kant and Jacobi issued public repudiations of his philosophy. Eventually, Fichte resigned his position and sought refuge in Berlin.

Tradition holds that the Atheism Controversy concerned personal and theological issues. The firebrand Fichte had often found himself at odds with authorities, garnering a list of charges that included disrupting public worship and supplanting God with reason. Although he might have moderated his position, thus avoiding the entire dispute, he refused to compromise, insisting that his critics were the true atheists. Kant suggested that if not necessarily atheistic, Fichte's theory lacked religious and philosophical significance, whereas Jacobi described it as a more thoroughgoing atheism than Spinozism.

In truth, the Atheism Controversy concerned more than Fichte's idiosyncratic personality and theology. It raised the question of whether idealism entailed social anarchy (see ANARCHISM AND UNBELIEF) and moral despair. Fichte's contempt for the Weimar Court threatened the tolerance that his moderate colleagues enjoyed under the enlightened Karl-August. Moreover, as a supporter of the French Revolution and self-proclaimed author of the "first philosophy of freedom," he tested the social and political order. Jacobi coined the term *NIHILISM* to describe the amoral egoism that he believed Fichte's "inverted Spinozism" implied (see also STIRNER, MAX). The Atheism Controversy opened fissures within post-Enlightenment thought that widened further during the *Pantheismusstreit*, or Pantheism Controversy, of 1811.

The Pantheism Controversy concerned issues raised by idealism, romanticism, and fideism. The sanctioned origin of the dispute was Jacobi's "Of Divine Things and Their Revelation" (1811), wherein he accused F. W. J. Schelling of pantheism, but his attack was motivated by Schelling's lecture "Concerning the Relation of the Fine Arts to Nature" (1807). Still earlier, Jacobi had quarreled with Schelling and G. W. F. Hegel over Hegel's *Faith and Knowledge* (1802), responding indignantly with letters to his young followers Köppen and Bouterwek. Eventually, the controversy alienated Jacobi from his former cohort, the romantic Goethe. More importantly, it demarcated boundaries between the older transcendental idealists, Kant and Fichte, and the younger absolute idealists, Schelling and his follower, Hegel.

Although Hegel wrote *Faith and Knowledge*, Schelling helped revise it before publication. Hegel and Schelling criticized Kant, Jacobi, and Fichte for failing to reconcile the dichotomies of God and nature, infinite and finite, and faith and knowledge. Hegel claimed that Kant opposed faith and knowledge, whereas Jacobi equated faith and knowledge, while Fichte tried to overcome the division between the objects of faith and finite knowledge by postulating an infinite striving to transform nature into an earthly "kingdom of God." He also disparaged Köppen, Friedrich Schleiermacher, and Johann Gottfried von Herder for their part in the Kantian-Protestant tradition of despair.

Although Schelling and Hegel thought that transcendental idealism neglected nature and religion, they rejected its romantic veneration of nature and its fideist elevation of faith as crassly sentimental and "unphilosophic." Despite their implicit critique of romanticism, Goethe supported Schelling and Hegel during the debate, describing himself as a polytheistic artist and a pantheistic scientist. Jacobi, for his part, regarded Goethe, Hegel, and particularly Schelling as pantheists, thereby

guilty of the deification of nature they condemned. As Köppen, Bouterwek, and Fries rallied to his cause, Goethe argued that Schelling's philosophy of nature disguised Spinozism in appealing Platonic garments that would lead gullible youth into atheism and then nihilism.

Although the Pantheism Controversy destroyed neither lives nor careers, it ruptured the fragile bonds between the movements generated by the *Aufklärung*, shattering their vision of the concurrence of human happiness and enlightenment. So, the contest between the idealists, fideists, and romantics deadlocked over the priority of faith or knowledge. Nonetheless, the debate isolated rifts within enlightened thought, forcing theorists to clarify their positions and thereby to scrutinize the intricate relations between belief and reason in the post-Enlightenment world.

The Spinozism, Atheism, and Pantheism controversies profoundly affected European intellectual development. The Spinozism Controversy revived interest in Spinoza, arguably the most consistent and courageous modern philosopher. Moreover, it introduced the world to Kant's transcendental idealism, which influenced nearly every branch of the arts and sciences. By revealing the specter of nihilism, the Atheism Controversy compelled philosophers to examine the ethical implications of abstraction in general and of idealism in particular. As a result of the Pantheism Controversy, Hegel escaped Schelling's shadow and dominated the European universities for the next fifty years.

Fichte, Hegel, and Schelling influenced the pessimist Arthur SCHOPENHAUER and in turn, the protoexistentialists Friedrich NIETZSCHE, Søren Kierkegaard, and Fyodor Dostoyevsky. The theories that emerged during the controversial legacy of the Enlightenment generated contemporary EXISTENTIALISM, romanticism, and postmodernism. As the young Hegelians including Ludwig FEUERBACH and Karl MARX threshed out the social implications of Hegel's philosophy, initiating worldwide revolution, the proto-fascists misappropriated the idealist and romantic traditions, spawning international genocide. Thus, the reverberations of the Spinozism, Atheism, and Pantheism controversies extend well into the twentieth century.

YOLANDA ESTES

CONWAY, MONCURE DANIEL (1832–1907), American author, reformer, and minister. Moncure Daniel Conway developed through Methodism, Unitarianism (see UNITARIANISM TO 1961), and a generalized theism to a belief in humanity. He moved from the United States to London, where he became a dissenting ethical leader, a powerful lecturer, and a writer of some influence.

He was born in Stafford County, Virginia, to a Southern family of distinction. His father was a magistrate and planter with conservative views. His mother was an intelligent and feeling woman who was also a homeopathic healer.

At an early age he went to a Methodist college and underwent a conversion there. He felt unable to follow his father's legal career, being more attracted to the spiritual life. He moved to a Methodist ministry in a Maryland circuit in 1851, where he felt increasingly unhappy. He came into touch with a Quaker community whose tolerant antislavery views appealed to him. He decided to train as a Unitarian minister at Harvard. By this time he had abandoned a belief in the literalism of the Bible and was becoming doubtful about the nature of Jesus. In addition he was influenced by the writings of Ralph Waldo EMERSON.

Radical Developments. He became the Unitarian minister in Washington, DC, in 1854; his radical views rapidly became apparent, especially toward slavery. After an antislavery sermon and his increasingly skeptical views on religion led to a split in his congregation, he moved to Cincinnati, where again his views led to divisions.

He was increasingly exercised by abolition and the impending Civil War, which rent his family in two. He became coeditor of an abolitionist paper, the *Commonwealth*. Abolitionists funded a trip to London, where Conway was expected to rouse support for their cause. He decided to stay in London and brought his wife—Ellen, a sensitive, intelligent, and sensible life companion—and his children.

South Place Chapel. Among the many people of influence he met in London was Peter Alfred Taylor, MP, a member of the South Place Chapel, Finsbury, which was at that time without an effective leader. He invited Conway to give his first lecture at South Place on May 6, 1863, in what was to be a key moment in his career. In 1864 he was appointed leader on a trial basis and in 1866 he took a permanent appointment. He ceased the custom of wearing robes, abandoned prayer, and changed the Bible readings to readings from the world's religions—but liked hymns. His *The Sacred Anthology* (1874) was

a valuable source of readings. He slowly moved from his generalized theist position to a belief in humanity, goodness, universal reason, immensity—fine sounding, but imprecise. Nevertheless, attendance grew and there was interest from such as Robert Browning, Thomas Henry HUXLEY, John Tyndall, and Friedrich Max Müller. Conway looked at comparative religion from an anthropological viewpoint as demonstrating the variety of the human response to the ultimate questions.

A creeping disillusion and pessimism led him to return to America in 1885. Journalism and writing preoccupied him. His two-volume *The Life of Thomas PAINE* (1892) was a great achievement of scholarship and the first major sympathetic account of Paine's life.

Conway returned to London in 1892 resuming his role at South Place, his successor Stanton Coit not having fit in. This time he was less happy and when in 1897 his wife became terminally ill, he left for America again. After the death of his wife he was outraged at the American war against Spain (he was an early peace campaigner) and was to become deeply opposed to England's Boer War. An earlier trip to India, where he was shocked at primitive religious rituals, led him to question the value of studying world religions. His overall outlook continued to become more pessimistic. He moved to Paris, where he died alone in 1907.

His was the remarkable career of someone pushing nonconformist religion beyond its limits. As a lecturer and writer his influence was wide. His legacy lives on in the activities of the South Place Ethical Society, which meets at Conway Hall in Red Lion Square, Holborn, London.

JIM HERRICK

CRADDOCK, IDA C. (1857–1902), American freethinker, Spiritualist (see SPIRITUALISM AND UNBELIEF), sex radical, and martyr to FREETHOUGHT. Born at Philadelphia on August 1, 1857, Ida Craddock was raised by her mother, Elizabeth Decker, in affluent circumstances. Her ancestry included Quaker and French lineage. She was educated in history, literature, and several languages; a friend recalled that "her mental capacity and memory were astounding."

At twenty-five she had been teaching shorthand at Girard College and had self-published an impressive textbook. In 1882 she applied for admission to the University of Pennsylvania. After passing an exam "very satisfactorily," the Faculty of the Arts listed her for admission, but the Board of Trustees turned her away, explicitly because she was female. Ida was never enrolled.

Unable to obtain a formal degree in spite of her aptitude, Ida took on menial work. In 1889 she wrote to a friend, "Now that I have stood down in the ranks of the miserable workers whom I once despised as a race beneath me, I know how they feel when they have to face the daily prospect of starvation and misery; and, God helping, I mean to work for them one and all, as long as I live."

By invitation, Ida became the secretary of the AMERICAN SECULAR UNION in 1889. She held that office for about three years, handling the organization's mail, producing its journal, *THE TRUTH SEEKER*, hiring its speakers, and organizing its annual conventions.

In 1893 Craddock visited the World Columbian Exposition at Chicago, where she saw a young Egyptian woman perform the belly dance. The public fell in love with it, and in a pamphlet, Ida defended the tradition as a way for chaste and decent women to show their erotic personae. *Danse du Ventre* was declared unmailable under the Comstock Act (see COMSTOCK, ANTHONY, AND UNBELIEF), so she withdrew it from circulation. From around this time she lectured on the history of sexuality, and in 1894 she changed her title from "Miss" to "Mrs. Craddock." The change of titles was explained in a lecture entitled "Celestial Bridegrooms," in which she stated, "It has been my high privilege to have some practical experience as the earthly wife of an angel from the unseen world." In the lecture she quoted ancient texts where encounters took place between mortal women and deities, including the Virgin Mary. Meanwhile, Ida's mother began stalking her wherever she traveled, exposing her as an unmarried woman (not a real "Mrs.") who was not entitled to discuss marital affairs. For three months of 1898, Lizzie Decker had her daughter committed to an asylum in West Philadelphia.

She was again prosecuted in Chicago for writing an essay called "Right Marital Living" and for providing sex counseling. After three months in jail she relocated to New York City. Ida was arrested yet again when authorities seized her new pamphlet, *The Wedding Night*, which told newlyweds about having sex with a person for the first time. In that era, when sex was a completely taboo subject, many brides did not have a clear understanding of what would happen after the ceremony. Men understood the matter just as poorly and simply raped their wives when the opportunity came. Ida explained what was going to happen; how the man should be patient and no more aggressive than the woman wished. Doctors, ministers, and even "social purity" activists

sent young people to Ida for this practical advice.

Sentenced to three months on state charges, Ida served the term in the spring of 1902. Upon her release, she was charged for the same offense under the federal statute and convicted again. Her attorney was not permitted to present arguments in her defense: the booklet was ruled obscene by the judge, and the jury was allowed only to decide whether she had mailed it. No person was alleged to have been harmed by anything she had written or taught.

Craddock was facing five years this time, and it was more than she could bear. On October 16, instead of appearing in court, she wrote suicide notes and took her own life. About Comstock, she wrote, "[T]he man is a sex pervert: he is what physicians term a sadist—namely a person in whom the impulses of cruelty arise concurrently with the stirring of sex emotion. The sadist finds keen delight in inflicting either physical cruelty or mental humiliation upon the source of that emotion."

Lizzie Decker wrote of her daughter, "[T]hat woman was as pure as God's snow and as chaste as His ice." An old friend wrote of Ida, "She was sacrificed to the monsters of creation, who kill what they cannot understand."

ROBERT P. HELMS

CREATIONISM. Creationism as a Cultural, Not Scientific, Issue. In some sense, all religious people are creationists. If one believes in a supernatural entity of some sort, that entity is usually connected in one way or another with the origin of the universe, if nothing else. Moreover, the term *creationism* has had a long and complex history, beginning well before the modern creation-evolution controversy, and even predating the publication of Charles DARWIN's *The Origin of Species* in 1859. In pre-Darwinian times, *creationism* referred to the belief that the soul of each human fetus was specially created, in opposition to the theory of traducianism, according to which souls were inherited from one's parents. At the time of the debate on the inheritance of the soul, of course, essentially everybody was a creationist in the modern sense of the word.

However, the term *creationist* is relevant to today's cultural debate only in a sense that is both neither historically accurate nor as broad as the general belief in a creator God. Creationists, in the discussion that follows, are people who deny all or most of the modern theory of biological evolution, with the purpose of advancing a religious agenda. Accordingly, this article does not include under that label the occasional scientist outside the academic mainstream who may have genuine (if usually erroneous) concerns about evolutionary theory from a strictly scientific perspective (for example, the late cosmologist Fred Hoyle). It is assumed that the reader realizes that evolutionary theory has the same status in modern biology that quantum mechanics or relativity have in physics: While many issues remain open to further research (both fundamental physics and organismal biology are active fields of inquiry), few, if any, practitioners with the required expertise actually think any of these theories will be fundamentally challenged on scientific grounds any time soon. In other words, what follows is an analysis of creationism, not a defense of evolution.

To understand the controversy, one must first recognize the continuum of creationist positions. Creationism is by no means a single intellectual or cultural entity. Then the two most important classes of creationist approach can be understood: young-earth creationism, as embodied, for example, in the California-based Institute for Creation Research; and the intelligent design movement, orchestrated chiefly by the Discovery Institute in Seattle (see INTELLIGENT DESIGN THEORY). Finally, this article will examine the burden of science educators in the controversy, and conclude with some general thoughts about the future of the debate.

Basic Classification of Creationist Types. Eugenie Scott of the National Center for Science Education has proposed an interesting classification of beliefs about "origins" (i.e., the origins of humans, of life, and of the universe). While any attempted taxonomy of such a complex network of cultural practices and beliefs is, of course, a simplification, Scott managed to capture important features that help us to understand the debate. Her classification is based on the identification of a continuum of positions, which can, however, be clearly divided into two major classes: people who believe that the earth is very young, more or less in accord with a literal reading of the Judeo-Christian-Muslim Bible, and people who accept a major conclusion of modern science, that our planet is in fact billions of years old.

Within young-earth creationism, Scott identifies a progression of beliefs from people who think the earth is flat (yes, a few still exist), to those who are stuck in a pre-Copernican worldview (the earth is not flat, but it is the center of the universe), to more mainstream positions that accept science up to and including the findings of

Galileo GALILEI and Isaac Newton, but refuse to accommodate to nineteenth- and twentieth-century geology and biology. This is a progression in the important sense that these various positions can be aligned on a gradient of increasing acceptance of scientific findings. Indeed, we could classify these people according to the century in human history in which their worldview seems to be stuck. So, flat-earthism remains in the twelfth or thirteenth century (toward the end of the Middle Ages) and geocentrism in the sixteenth; young-earth creationism of the more common variety can be said to have "progressed" to the seventeenth century.

This trend continues across the divide identified by Scott which separates young- from old-earth creationists: so-called gap-theory and day-age creationists wish to retain some close reading of the Bible, but acknowledge nineteenth- and even some twentieth-century findings about an old earth. Consequently, they propose gaps in the biblical narrative or reinterpret biblical "days" as geological ages. However, they refuse to accept much of post-Darwinian biology, though some do grant a limited role to natural selection (but so do some young-earth creationists, admitting that natural selection can indeed eliminate maladaptive variants from within rather fuzzily described "kinds"—a biblical term—of plants and animals).

The final range of Scott's continuum of creationist positions includes more intellectually sophisticated (but still scientifically groundless) ideas, such as theistic evolution and, of course, intelligent design. Theistic evolution comes as close to a completely materialistic view of the universe as is possible for a religious person: God exists and he did create the universe, but afterward events unfold through the action of natural laws (put in place by the Creator, of course). Evolution by natural selection, therefore, is the way God decided to have things work in the biological realm. While this position has been criticized on philosophical and theological grounds all the way back to David HUME's *Dialogues concerning Natural Religion*, it is quite acceptable among scientists and science educators because it doesn't result in challenges to the way science is taught in public schools. The same cannot be said for the intelligent design movement, to be examined shortly.

Young-Earth Creationism: Emotion over Intellect. Young-earth creationists generally believe our planet is only a few thousand years old, and that human beings were created directly by God together with all "kinds" of living organisms. They also think God unleashed a worldwide flood about four thousand years ago (despite the total absence of geological evidence for this), and that a man named Noah single-handedly repopulated the earth with selected pairs of all animal and plant "kinds," a most radical exercise in genetic engineering. This author once pointed out to young-earth creationist Ken Hovind that to assume that the millions of species currently living on the planet are "derived" (that is, evolved) from the few thousand kinds that were present immediately after the flood is actually to concede a rate of evolution that not even the most wildly optimistic evolutionary biologist would contemplate.

But of course that is precisely the point: logic and evidence have little to do with young-earth creationism. This is a belief system that is highly emotional and quite unsophisticated intellectually. While it is hard to imagine that people with the intellectual capacity to function in modern society can so fervently believe in self-contradictory fables written down thousands of years ago, that is a pretty accurate description of the young-earth position.

Young-earth creationists are often genuinely stunned when scientists refuse to yield to their "obvious" objections to evolution. How, they wonder, can anyone seriously think that a random process is capable of originating complex organisms adapted to their environment? (Answer: Evolution by natural selection is *not* a random process, because it relies on a combination of random mutations and nonrandom selection, the latter due to competition for resources among living organisms.) Or, the incredulous young-earther may ask, how can anyone believe in radioactive dating of rocks, when there are errors and discrepancies in the published measurements? (Answer: *Any* human measurement comes with a certain degree of error, which leads to discrepancies; the issue is not whether there are differences in the estimates of the age of the earth carried out with different methods or by different researchers, but *how large* those differences are. As it turns out, they are very small.) Young-earth creationism is a quintessential expression of anti-intellectualism, the preference for a folk understanding of the world over the one proposed by scientists and intellectuals.

Intelligent Design: The Intellectual Side of Creationism. Some creationists have acknowledged that modern, particularly Western, society is highly influenced by intellectual endeavors, science being the one that attracts both the most funding and the best media coverage. This insight underlies the intelligent design (ID) movement. ID proponents make strenuous efforts to distance themselves from the more overtly religious rhetoric typical of young-earth creationism, often denying that they are creationists at all. Their strategy (openly declared in an infamous planning document known as "The Wedge," which a leading ID organization unaccountably posted on its Web site for several months) is to make headway into academic circles and mainstream media by presenting themselves as defenders of a reasonable position that ought to have its day in the court of scientific and public opinion. Unspoken is the consequence that thereby a door would be opened for the teaching of religion in public schools.

The problem, of course, is that intelligent design already has had its heyday, culminating in the publication of William Paley's *Natural Theology* in 1831. Paley was taken very seriously by Darwin, and the debate between natural theology and a completely scientific

view of the world raged throughout the eighteenth and nineteenth centuries (see EVOLUTION AND UNBELIEF; DARWINISM; HUXLEY, THOMAS HENRY). But intelligent design lost that battle on intellectual grounds: it is no longer either a scientific position or a philosophically viable one. This is why modern ID proponents such as Michael Behe (author of *Darwin's Black Box*), William Demsbki (*The Design Inference*, among several others), Jonathan Wells (*Icons of Evolution*), and Phillip Johnson (*Defeating Darwinism by Opening Minds*, among others) frankly embody a regression to the early nineteenth century—as far as any creationist view can hope to advance.

The important thing to understand about ID is that it is an entirely negative position: it begins (and ends) with the observations—denied by no serious scientist—that there are unexplained facts about biology, and that scientists have ongoing discussions regarding different mechanisms that may account for biological evolution. Both are certainly true (though ID proponents often misrepresent such debates), but the same holds in any viable science. The essence of scientific inquiry is that research is open ended; debate is continuous, and revisions of past positions are always possible (in sharp contrast, one might note, to any form of creationism proposed so far). To fault scientists for continuing their inquiries and disagreeing with each other is fundamentally to misunderstand (or actively to misrepresent) what science is about.

Moreover, what does ID propose as an alternative? Behe, Dembski, and their colleagues are characteristically vague about what they suspect their designer might actually be, or how it operates. And for good reason: were they to be more specific, they would have either to admit that ID is a thin veil for Judeo-Christianity or to propose testable statements that could actually be evaluated in the scientific process. But that latter is simply not possible. (Asked directly by this author what sort of experiments the Discovery Institute might undertake if it received federal funding to conduct research on ID, Dembski had no answer.)

Yet the intelligent design movement cannot be dismissed, as it appeals to conservative and even mainstream religious believers as a "reasonable compromise." What harm could there be in teaching our students that there is a controversy? Isn't the possibility of an intelligent designer at least conceivable? Indeed, the controversy could be taught, but in social studies classes in the context of the so-called culture wars, not in science classes—for the simple reason that ID is not science by any definition of the term. Yes, an intelligent designer is obviously conceivable, but science is not about conceivable possibilities, it is about empirical facts that can be subjected to observation, experimentation, and hypothesis testing. As for the portrayal of ID as a reasonable compromise, consider whether teaching both that the Holocaust happened and that it was a fabrication of Zionist propagandists (a position actually maintained by some pseudohistorians) would be considered an acceptable compromise in history classes. It would not, unless there *actually were* a controversy raging among professional historians. But there is no such controversy, either among historians or among biologists.

Dealing with ID proponents requires more intellectual sophistication than dealing with their young-earth counterparts, partially because many defenders of ID have legitimate academic credentials and because their arguments are dense with jargon and quasi-genuine philosophical or mathematical points. That is why the most effective weapons against ID are probably improvements in science education for science teachers (which may also result in better science education for children), and tirelessly calling ID proponents' bluff by demanding details on the sort of testable hypotheses an ID research program might actually investigate.

The Sins of the Education Community. Despite all of the above, the current creation-evolution controversy cannot be blamed exclusively on the illiteracy or bigotry of a large part of the public. After all, that public is supposed to be getting an education from public schools and exposure to the media, so the educational and scientific communities are at least partly responsible for today's sorry state of affairs. Two important points should be kept in mind when discussing the role of science education in this or any other ideologically charged controversy: First, American culture has always been affected by different strands of anti-intellectualism whose causes are various and have been long studied by sociologists. It is therefore naive to expect that better science education alone will quickly eliminate the problem. Second, *science education* can have different meanings; simply having more of the kind of science education that is currently delivered is unlikely to affect the national level of understanding of science (and of evolution in particular) significantly.

While a discussion of science education is beyond the scope of this article, it is important to understand one crucial distinction: teaching factual knowledge of science with a minimal conceptual background is very different from teaching the conceptual foundations of science, peppered with enough factual information to ground the student's understanding in empirical reality. The first approach is by far the most common, but it is also the one that is arguably responsible for turning *off* many students to science, and it apparently does little to increase the level of critical thinking in our society, the real goal of liberal arts education.

The second approach is, however, slowly gaining ground, both at the college level and, more importantly, at high school and earlier levels. Online resources, teachers' conferences and workshops, and new textbooks are now available for educators seriously interested in turning the classical approach around: rather than hoping the foundational ideas of science will seep through an ocean of facts, one provides the students with the conceptual tools to seek and understand the relevant

facts. Among many reasons why this is a positive trend is the obvious one: it is impossible to go on teaching "all the facts" in science because science keeps accumulating "facts" at a vertiginous pace. Consider, for example, that an introductory college textbook in biology is now more than a thousand pages long, typically devoting only a few of those pages to the methods by which scientists actually uncover those all-important "facts." Indeed, it is likely that the textbook industry will evolve toward offering separate reference and conceptual texts: just as one needs a dictionary to understand English literature, yet a sensible teacher wouldn't dream of having students memorize the dictionary in order to learn how to read or write, we need reference books for science facts accompanied by slimmer textbooks aimed at using selected parts of the "facts" database to teach how science actually works.

There are several reasons why this trend toward a more sensible science education will take a great deal of time to become mainstream. The principal obstacles in the United States are class size, excessive reliance on standardized tests, and teacher training practices that leave teachers ill equipped to master new conceptual approaches to science education. None of these obstacles is insuperable, but overcoming them may take a generation or more. Nonetheless, a different approach to science education, more focused on critical thinking and conceptual understanding, is a mandatory step not only in eventually overcoming the evolution-creation controversy, but more broadly in educating citizens better able to participate in a democratic society.

Will Creationism Ever Go Away? Will the creation-evolution debate ever be won? The resurgence of creationism during the 1990s and the early twenty-first century, especially in the guise of the intelligent design movement, appears not to justify optimism. Yet there are good reasons to hope for a better future. If we take the long view of human history, it is undeniable that vast progress has been made. Modern scientists no longer have to fear the sort of retaliation from religious bigots that Giordano BRUNO or Galileo GALELEI suffered only a few centuries ago. Moreover, once highly controversial notions (such as that the earth is not flat, or that it isn't the center of the universe) are now accepted by most people on the planet as a matter of fact.

Eventually, one can hope, the controversy over evolution will go away just as the controversy over Copernicanism did. But the uncanny ability of humans to believe in nonsense is never to be underestimated, and will always find new forms. It is conceivable, perhaps even likely, that a new frontier for irrationality will open when (or if) scientists produce a viable theory of how consciousness arises as a natural epiphenomenon of the brain, or when (or if) they succeed in producing genuine artificial intelligence (see COGNITIVE SCIENCE AND UNBELIEF). It is easy to imagine twenty-second-century religious fundamentalists who have accommodated to twentieth-century science and accept the theory of evolution drawing a new line in the sand at the idea that a mere machine (or animal) can have consciousness: surely that must be the province of the soul. And so on.

There is also, of course, the very real danger that society might slip back, if not to the Dark Ages, at least to a point at which science illiteracy becomes so widespread as to endanger our capacity to flourish and to compete economically. Science and reason, as Carl SAGAN aptly put it, truly are "candles in the dark," and critical thinkers must be constantly on watch to make sure those candles stay lit. Fighting creationism and intelligent design in all their varying forms will be an important part of this ongoing battle.

MASSIMO PIGLIUCCI

DANIELS, VIROQUA (1859–1942), American anarchist-Communist and poet. "A poor country girl, who has never had any advantages of education," this important anarchist writer has been forgotten, in part, because an injury forced her to lead a quiet life. Born December 4, 1859, at Tipton, Iowa, Viroqua Daniels arrived at age sixteen at her family's new homestead in northeastern California. Her very literate father, Sylvester Daniels, hunted and played violin to earn a living. At nineteen she caught her skirt in the brake handle of a wagon, hitting her head against the wheel, and the accident made her chronically ill. Between 1878 and 1895 she became interested in social questions. Living for some time with her brother Hubert, she educated herself, and was the "smartest" in her close-knit family. In 1898, when another health crisis brought her to San Francisco, she took a dietetic cure but was an invalid for some time. Around that time, she fell in love with Richard Dav-

erkosen, a well-educated radical of German birth. They had one son, Hubert, in 1900 and remained together until death.

From 1895 Daniels wrote dozens of articles and fine poems, mostly for the *Firebrand* and *Free Society* until 1903, and occasional pieces for *Mother Earth* and *Why?* until 1914. She describes the rural poor who became paralyzed, crazed by anxiety and heartbreak, and killed by workplace accidents, starvation, or suicide. Her works, which were often reprinted, advocated strict anarchist-Communism to the exclusion of other theories, and held that "property, not morality, is the bulwark of the marriage institution." About Leon Czolgosz (who killed President William McKinley) Daniels wrote, "every rebellious act, whether great or small, wise or unwise, when done by a conscious slave, adds to the struggle for freedom." She wrote against religion (especially Catholicism) and for the practical education of children that encouraged individuality. Robbed of Richard's pension by the Catholic Church because their marriage was not "legal," Viroqua was looked after by her son until she died of breast cancer on November 5, 1942.

ROBERT P. HELMS

DARROW, CLARENCE SEWARD (1857–1938), American lawyer and atheist. One of the best-known figures in twentieth-century American jurisprudence, Clarence Seward Darrow was not only one of the nation's top defense attorneys but also an orator, writer, and strong advocate for civil liberties causes. He was born in Farmdale, Ohio, one of eight children of Amirus, a furniture maker and undertaker, and Emily Darrow, who were intellectually curious and passed on their love of books and learning to their children.

Amirus Darrow had graduated from a theological seminary but soon afterward lost his faith, so he refused to preach. Despite their parents' antireligious views, the Darrow children were taken to church every Sunday, perhaps because the parents wanted to protect their children from disdain in their community. But young Clarence always felt the time he spent in church and Sunday school was wasted. The Darrows were scorned in the community for their atheistic views; however, they were also active abolitionists, allowing their home to serve as an Underground Railroad station.

Darrow attended Allegheny College for a year before dropping out to teach school in winter and work in a factory in the summer. After becoming interested in law he attended the University of Michigan Law School, but completed only one year. He gained practical experience in a law office in Youngstown, Ohio, while he prepared for the bar examination. At the age of twenty-one he gained admission to the bar. In that same year, 1878, he married Jessie Ohl. Five years later they had a son, Paul.

After moving to Chicago in 1888, Darrow befriended John P. Altgeld, a superior court judge and a man he had long admired for his liberal views on the penal system. Probably due to this association, Darrow was soon after appointed city attorney by Mayor DeWitt C. Cregier. Darrow assisted Altgeld in his successful bid for governor of Illinois, after which Altgeld pardoned the three remaining Haymarket martyrs, thus ruining his political career. After a few years, Darrow became general attorney for the Chicago and North Western Railroad, a large, corporate, antiunion company. It was Eugene Debs and his American Railway Union's involvement in the Pullman strike that spurred Darrow to change his allegiance, and he resigned his position at the railroad company. In 1894 he successfully defended Debs in a conspiracy case, then on a contempt of court charge a year later, turning the tables on the corporation. It was clear that Darrow's association with Debs had made a strong impression on him. Darrow and Jessie agreed to an amicable divorce in 1897. In 1903 Darrow married Ruby Hamerstrom, and she remained his devoted companion throughout his life.

Darrow became one of the top labor lawyers in the United States. At the same time he continued to work for corporations, defending himself against criticism by explaining that he had no interest in money but that he took cases that would pay him in order to use that money against the system. He funded his less lucrative cases from the money he earned from the corporate ones. His more radical and renowned cases included those of William D. (Big Bill) Haywood, charged with inciting to murder the governor of Idaho in 1907, and the McNamara brothers, accused of attempting to bomb the *Los Angeles Times* building in 1911. Darrow sympathized with anarchists and socialists, and was always willing to come to their defense. By this time famous for his skills as a trial lawyer, he was sought after in several high-profile cases, including the Leopold-Loeb murder trial in Chicago in 1924 and the Ossian Sweet murder case in Detroit in 1925, arising out of an angry white mob's attack upon an African American family's home.

As far as freethinkers are concerned, the most important legal case of Darrow's career was the evolution case, the 1925 Scopes Monkey trial. Although he often took cases for a drastically reduced fee, this was the only time Darrow ever offered to donate his services. In

the early 1920s Tennessee and other states in the Bible Belt had, with the assistance of politician and religious fundamentalist William Jennings Bryan, passed a law against teaching evolution in the schools. As a result, John T. Scopes, a twenty-one-year-old high school teacher, was arrested in Dayton, Tennessee, for corrupting young minds with ideas that contradicted the creationist viewpoint. Darrow heard that Bryan had volunteered to serve as the prosecuting attorney, and knew that the case would be turned into a farce and a platform for Bryan's fundamentalist views. Public opinion was strongly against Scopes, and Darrow's plans for calling several expert witnesses in the field of science were dashed when presiding judge John T. Raulston refused to allow them to testify. Although Darrow was permitted to call Bryan as an expert witness on the question of religion, and was able for a time to expose Bryan's flimsy argument, Darrow was not allowed to proceed with his questioning, and Scopes was convicted. The decision was eventually overturned by the state supreme court, with Darrow receiving a long ovation after his closing argument.

In his autobiography, *The Story of My Life*, Darrow spends two chapters rationalizing logically and scientifically that there can be no god. Since childhood, he had studied science and reason, and had obviously given the topic a great deal of consideration. Realizing that human life was basically full of misery and fraught with pain and sorrow, he believed it is far better for people to treat each other with compassion in this life rather than hope for a better existence in the afterlife.

Clarence Darrow died in Chicago on March 13, 1938, after a long illness. Thousands of people from all walks of life attended his funeral. The undertaker kept the funeral parlor open for forty-eight hours in order to accommodate the crowds. After Darrow was cremated, his son scattered his ashes in Jackson Park.

Tennessee Williams dedicated his play *Not about Nightingales* to Darrow, whose "mental frontiers were the four corners of the sky."

JULIE HERRADA

DARWIN, CHARLES ROBERT (1809–1882), English naturalist. In an age when science and society were founded on creationist beliefs, Charles Darwin solved the "mystery of mysteries" of his day: namely, how living species originate. He abandoned the Bible as an authority on creation and explained the origin of species by divinely ordained natural laws. For his devotion to science and exemplary life, he received Britain's highest posthumous honor: scientists joined churchmen and politicians of all parties to inter his body in Westminster Abbey.

Early Life and Education. Charles Robert Darwin was born at Shrewsbury on February 12, 1809, the second son and second-youngest of six children. His father, a freethinking physician (see FREETHOUGHT), and his mother, a devout Unitarian (see UNITARIANISM TO 1961), had him christened in the parish church. As a boy, he attended chapel with his mother and was sent to the school run by the minister. He then sat under a future bishop at Shrewsbury School until 1825, when he went to Edinburgh to study medicine with his brother, Erasmus.

Edinburgh was freethinking and cosmopolitan, with strong cultural links to the Continent; its university had the best medical faculty in Britain. But a year later, after Erasmus left, Charles found it hard to concentrate. He preferred to explore the seashore with Dr. Robert Grant, an anatomy lecturer who gave him his first lessons in zoology. A Francophile materialist and evolutionist, Grant was dedicated to overthrowing the church and bringing about radical social change. He sponsored Charles's first scientific paper at a meeting of a student club, the Plinian Society. After the presentation, Charles saw a fellow student's remarks on the identity of mind and brain struck from the minutes. It was a lesson on the perils of unbelief.

He finally dropped out of medicine, unable to stomach surgery. To cure his indirection, his father prescribed a stint at Cambridge University to train for the Church of England. In a country parish, Charles would have a respectable social role, a guaranteed income, and above all the leisure to indulge his Edinburgh interest in natural history. After reading a few divinity books, Charles decided there was nothing in them he could not say he believed, and in early 1828 he went up to Christ's College to study for the BA and ordination.

Cambridge was a market town dominated by a medieval university—totally unlike Edinburgh. Here the professors were untainted by French radicalism: clergymen such as the botanist John Stevens Henslow and the geologist Adam Sedgwick, who agreed that species and society alike were kept stable by God's will. This was the reigning orthodoxy in Cambridge as taught from texts by Rev. William Paley. Everyone subscribed to it more or less. Unbelievers such as Rev. Robert TAYLOR, an apostate Cambridge ordinand who in 1829 attempted an "infidel mission" to the university, were ostracized.

Darwin never forgot the example of the man known as the "Devil's Chaplain."

At Cambridge, natural history became his passion. On his knees collecting beetles and on Henslow's botanical excursions, Charles took the parson-naturalist as his role model. After a geological field trip with Sedgwick in August 1831, Darwin received a letter from Henslow offering him a place as captain's companion on the HMS *Beagle*. This was the turning point of Darwin's life. His path to a country parish was now diverted by way of a voyage around the world.

The *Beagle* Voyage. For five years Darwin dreamed of a parson's life, seeing it as "a type of all that is respectable & happy." His religious beliefs and practices remained conventional. Like his Cambridge professors he rejected the book of Genesis as a literal account of creation, but quoted the Bible as a moral authority. A parting gift, the first volume of Charles Lyell's *Principles of Geology* (1830), convinced him that earth's crust had been laid down over countless ages according to fixed natural laws. He theorized about the formation of islands and continents and began to see himself as a geologist. The *Beagle*'s aristocratic captain, Robert FitzRoy, was a foil for his developing science and a reminder of Tory-Anglican prejudice. Soft on slavery, FitzRoy outraged Darwin's Whig abolitionist morals.

During the voyage, Darwin's view of nature and humanity was transformed by three unforgettable events. Wandering for the first time in a lush Brazilian forest, he had something like a religious experience. "No one can stand unmoved in these solitudes, without feeling that there is more in man than the mere breath of his body," he confessed, even while sensing that man and nature were one. At Concepcion in Chile, he survived a terrifying earthquake. Nature's power awed him; even the cathedral was not spared. Most moving was Darwin's first encounter with the aboriginal peoples of Tierra del Fuego. He wondered how these wild, naked nomads could have come from the same God who created Cambridge dons. The experience shook him to the core.

Before the voyage ended in 1836, Darwin began to suspect that species, like races of animals and plants and the races of mankind, had descended from one another. So much could be explained if the diversity and distribution of living things on continents and islands had come about through ordinary natural processes rather than creative miracles.

London and Marriage. Back in London, Charles stuck close to his brother. Erasmus was well connected—and a freethinker with radical ideas. His reforming friends believed in a God who ruled the world, not miraculously or directly, but through natural laws. God must have created living species by some progressive law, they speculated, but none of them knew what it was. Darwin, twenty-eight years old, determined to find out. He read voraciously—natural history, philosophy, theology, economics—and he made extensive notes.

In the first of a series of notebooks, he drew a branching tree to show how species had descended from one another. This was a family tree, full of the ancestors of today's species. After observing an adolescent ape in London's zoo, Darwin jotted excitedly: "Let man visit Ourang-outang . . . hear its expressive whine, see its intelligence when spoken [to] . . . see its affection . . . see its passion & rage, sulkiness, & very actions of despair; [then] let him look at the savage, roasting his parent, naked, artless, not improving yet improvable & then let him dare to boast of his proud preeminence." Darwin had seen humans in the raw; most naturalists and churchmen had not. They prided themselves in mankind's special creation, but for Darwin evolution explained the differences. It was "more humble" to have apes in the human family tree, to believe savages and civilized people alike were "created from animals."

Darwin's belief in creation by evolution was born of theological humility, though he admitted its heretical tendency: even our "love of the deity" is the "effect of [the brain's neural] organization," he jotted half-reproachfully; "oh you Materialist!" If one species changes, if one instinct can be acquired, he admitted, then the "whole fabric totters & falls"—the whole traditional fabric of creationist beliefs about nature, God, and humankind.

About this time Darwin became increasingly unwell, suffering headaches and stomach upsets. Insomnia and nightmares plagued him; once he even dreamt of public execution. He felt like a prisoner in London, tied down by his *Beagle* work, pondering evolution and dreading the consequences. In his notebooks he devised protective strategies against the day when he might publish. He would pitch his theory to traditional creationists, emphasizing its superior theology. A world populated by natural law was "far grander" than one in which the creator interferes with himself, "warring against those very laws he established in all organic nature." Imagine—Almighty God personally lavishing on earth the "long succession of vile *Molluscous* animals—How beneath the dignity of him, who is supposed to have said let there be light & there was light"!

In the spring of 1842, Darwin resumed the theme in a pencil sketch of his theory, which he now called "natural selection." It seemed so obvious: nature "selects" the best adapted organisms, as celebrated in Paley's old *Natural Theology* (1802). They survive the constant struggle for food, laid down as a law of nature in Rev. Thomas Malthus's famous *Essay on the Principle of Population* (1798), and pass on the adaptive advantage to their offspring. Thus, in Francis Darwin's words, through "death, famine, rapine, and the concealed war of nature" God's laws bring about "the highest good, which we can conceive, the creation of the higher animals. . . . [T]he existence of such laws should exalt our notion of the power of the omniscient Creator."

Darwin might have sounded like a parson, but the church was now the last thing on his mind. Harboring as he did a theory that subverted the "whole fabric" of traditional orthodoxy, he was plainly unfit for ordination, never mind his illness. With a generous legacy from his father, Darwin married his first cousin Emma Wedgwood in 1839. After two children were born they made plans to escape from London. In September 1842 they moved to the Kentish village of Downe, where Charles fulfilled his old dream to be a parish naturalist. Their new home, Down House, was the former parsonage.

Parish Naturalist. At Downe, Emma became his full-time nurse and the mother of ten. She was a sincere Christian like all Wedgwoods of her generation, Unitarian by conviction, Anglican in practice. Charles differed with her painfully. After he revealed his theory to her, she feared they would be separated in death and he would suffer eternal torments. Emma's anxiety remained a sad undercurrent in the marriage, her heartache and prayers increasing with his illness.

Outwardly respectable, Darwin continued to work privately on his theory, unwilling to publish. In his study, he wrote book after book on geology. He dissected almost every known barnacle, and in 1844 he transformed his pencil sketch of natural selection into a long essay. Revealing his belief in evolution was, he confided to a friend, "like confessing a murder"—a capital crime. He entrusted the essay to Emma, to be published "in case of my sudden death." Working obsessively, fearing his theory would make him an outcast, Darwin thought he might not survive to see natural selection in print.

Events came to a head when he had a serious breakdown after his father's death in 1848. For the first time Darwin felt that he himself was about to die. Four months at a spa worked wonders, but he returned home only to see his eldest daughter taken sick. When Annie died tragically over Easter 1851, aged ten, he found no comfort in Emma's faith. After years of backsliding, Darwin finally broke with Christianity. His father's death had spiked the faith; Annie's clinched the point. Eternal punishment was immoral. He would speak out and be damned.

Down House was now his pulpit, evolution his new "gospel." He pressed on, polishing his theory, extending it, finding illustrations everywhere. Finally in 1856, after receiving the Royal Medal of the Royal Society for his work on barnacles, Darwin was ready to write *On the Origin of Species*. As he started, a colleague remarked to him on the "indecency" of sexual relations in jellyfish. Darwin rejoined, "What a book a Devil's Chaplain might write on the clumsy, wasteful, blundering low & horridly cruel works of nature!" It was a book he feared he might be accused of writing, one that would cause him to be reviled as an unbeliever, like the first Devil's Chaplain, Rev. Robert Taylor.

In October 1859 Darwin fled to a spa on the Yorkshire moors to wait for the *Origin of Species* to be published. To Henslow at Cambridge he wrote, "I fear you will not approve of your old pupil," and to another colleague he groaned: "Lord how savage you will be . . . how you will long to crucify me alive!" Those weeks of waiting, he said, were like "living in Hell." Fifty years old, at the pinnacle of his career, he had everything to lose. But his worst fears never came true.

The *Origin* and the Church. The *Origin of Species* (1859) was the last great work in the history of science in which theology was an active ingredient. The word *evolution* did not appear in the first edition, but Darwin used *creation* and its cognates more than one hundred times. Opposite the title stood a quotation from Francis Bacon about studying God's works as well as his word, and another by the Reverend Master of Trinity College, Cambridge, about "general laws" as God's way of working. On the last page, Darwin rhapsodized about the "grandeur" of viewing nature's "most beautiful and most wonderful" diversity as the product of "powers . . . originally breathed into a few forms or into one." This played to believers, but Darwin's tone and terminology—even the biblical "breathed"—were not insincere. From start to finish the *Origin of Species* was a pious work: "one long argument" against miraculous creation, but equally a reformer's case for creation by law.

There was doublethink in it, and a certain subterfuge. The book was the man after all—ambiguous, even contradictory. Darwin avoided the inflammatory subject of human origins, though it had been central to his theorizing from the start. The hints he dropped—"light will be thrown on the origin of man and his history," for example, or "some little light can apparently be thrown" on racial differences—pointed to a mass of research that would only be published twelve years later in *The Descent of Man*. Even then, he dreaded being thought "an outcast & a reprobate."

In the end the *Origin* held multiple meanings; it could become all things to everyone. Radicals loved it, the theology notwithstanding. Anglican diehards loathed it and muttered about Darwin's eternal destiny. Emma herself now worried more about her husband's suffering in this life as the *Origin* went into the world. Yet she prayed that his pains would make him "look forward . . . to a future state" where their love would go on forever.

Not all Anglicans damned Darwin. The "celebrated author and divine" quoted in later editions of the *Origin* was Rev. Charles Kingsley, a Cambridge professor. His plug for Darwin's theology—it seemed "just as noble" as miraculous creationism—was timely but timid, a "Yea" to the hearty "Amen" from Oxford's geometry professor Rev. Baden Powell. Writing in the liberal Anglican manifesto *Essays and Reviews*, he saw the *Origin* bringing about "an entire revolution of opinion in favour of the grand principle of the self-evolving powers of nature." For such remarks Powell and his fellow essayists were hounded for HERESY (see UNITED KINGDOM, UNBELIEF IN). When a private petition was got up in their defense,

Darwin rallied to the cause, adding his signature. He welcomed the efforts of these *septum contra Christum* (seven against Christ) to "establish religious teaching on a firmer and broader foundation."

Worse heretics embarrassed the church from without. In later years Darwin was asked again and again to support them. But although the *Origin* became all things to everyone, he himself found this impossible. He avoided public support for British heretics while quietly sending donations to the Free Religious Association in the United States. He agreed to "almost every word" of its creed, which augured "the extinction of faith in the Christian Confession" and the development of a humanistic "Free Religion" (see RELIGIOUS HUMANISM).

The *Descent* and Religion. In his long-awaited *Descent of Man* (1871), Darwin saw humans evolving physically by natural selection, and then intellectually and morally through the inherited effects of habit, education, and religious instruction: "With the more civilised races, the conviction of the existence of an all-seeing Deity has had a potent influence on the advance of morality," so much so that "the birth both of the species and of the individual are equally parts of that grand sequence of events, which our minds refuse to accept as the result of blind chance."

Two-thirds of the book was devoted to a knock-down argument for a theory barely discussed in the *Origin of Species*, "sexual selection." This was Darwin's prize solution to the central problem of nineteenth-century ethnology, the origin of racial diversity. Female choice among competing males according to local beauty standards gave rise to the physical and mental differentiation not only of the sexes, but also of the human races. Like fancy pigeons, the races are only varieties of a single species, members of one family. This traditional Christian belief in the unity of humankind, fortified by sexual selection, underwrote Darwin's lifelong hatred of slavery.

Given its subject matter, the *Descent* bore the imprimatur of Darwin's daughter Henrietta, an able stylist and fussy moralist. Parts he had feared would read like an infidel sermon—"Who w[oul]d ever have thought I sh[oul]d turn parson!"—he asked her to tone down. Emma herself jogged the editor, reminding her that however "interesting" the book's treatment of morals and religion might be, she would still "dislike it very much as again putting God further off." Henrietta tidied the proofs and the *Descent* caused few commotions. For her good work she was given a free hand in editing Charles's biographical sketch of his freethinking grandfather. *Erasmus Darwin* appeared in 1879 shorn of the religiously risqué. Beside her as she worked was her lawyer husband, who managed property for the Ecclesiastical Commission.

But Darwin could be more candid in his autobiography. It was written for the family, not publication, between 1876 and 1881, and contained his fullest statement on "religious belief." At first he had been unwilling to give up Christianity and had even tried to "invent evidence" to confirm the gospels, which prolonged his indecision. But just as his clerical career had died a slow "natural death," so his faith withered gradually. And there was no turning back once the deathblow fell. His dithering crystallized into a moral conviction so strict that he could not see how anyone—even Emma—"ought to wish Christianity to be true." If it were, "the plain language" of the New Testament "seems to show that the men who do not believe, and this would include my Father, Brother and almost all my best friends, will be everlastingly punished. And this is a damnable doctrine."

These words recalled the bitter months and years after his father's death. Since then Darwin's residual theism had been worn down by controversy. Now, as one with "no assured and ever present belief in the existence of a personal God or of a future existence with retribution and reward," he confessed, "I . . . must be content to remain an Agnostic" (see AGNOSTICISM)—an unbeliever, but no less an upright man, living without the threat of divine wrath. "I feel no remorse from having committed any great sin," he assured Emma and the family. "I believe that I have acted rightly in steadily following and devoting my life to science."

Discretion and Immortality. Darwin always avoided speaking publicly about religion. In private letters, he revealed that he no longer believed "in the Bible as a divine revelation, & therefore not in Jesus Christ as the Son of God." Yet, he admitted, his "belief in what is called a personal God" had been as strong as a prelate's when he wrote *The Origin of Species*; and three years before his death, he acknowledged that he had "never been an atheist, in the sense of denying the existence of a god . . . generally (& more & more as I grow older), but not always . . . agnostic would be the most correct description of my state of mind."

He believed "freedom of thought is best promoted," not by "direct arguments against christianity & theism," but "by the gradual illumination of men's minds, which follow[s] from the advance of science." He said so to Karl MARX's son-in-common-law, Edward Bibbins AVELING, in a letter marked conspicuously "Private." By a curious confusion, this letter was later thought to have been addressed to Marx himself, a myth now decisively exposed.

Shortly after receiving the letter, Aveling and Ludwig BÜCHNER, president of the International Federation of Freethinkers, lunched with Darwin at Down House. Aveling would later report Darwin's admission, "I never gave up Christianity until I was forty years of age." About this time, it appears, an evangelical temperance worker, Elizabeth Cotton, alias Lady Hope, also visited Darwin and, as she later claimed, found him reading the Bible. Her colorful account of their meeting, first published in 1915 in the United States, gave rise to rumors of a "deathbed conversion," now

exposed as a legend (see DEATHBED CLAIMS CONCERNING UNBELIEVERS).

By keeping his religious beliefs and unbeliefs to himself, Darwin never knowingly gave offense except to radical freethinkers and atheists who wanted him publicly on their side. And for his reticence, his character, and his epoch-making science, he achieved immortality. On April 19, 1882, his remains were laid with religious pomp in Britain's most hallowed sanctuary, Westminster Abbey. Priests officiated at the graveside, politicians of all parties gathered around, and his agnostic allies joined them. Now called "scientists," they were paying their dues, for Darwin had delivered nature and human destiny into their hands.

Evolution had become respectable. No revolution took place, no pyrotechnics, just a quiet change at the top—a palace coup. Society would never be the same (see EVOLUTION AND UNBELIEF). A Devil's Chaplain had done his work.

DARWINISM AND UNBELIEF. A fierce religious war is systematically being waged against the values of scientific truth, and the frontline trenches—by the enemy's choice—are in the field of biological education and specifically Darwinism. The reason is clear. Charles DARWIN comprehensively destroyed the biological version of the argument from design, always by far the most popular argument for belief in a deity (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST; EVOLUTION AND UNBELIEF). And the biological version of the argument is much more compelling than the physical or cosmological version, as William Paley, the author most readily associated with natural theology, recognized in 1802: "My opinion of Astronomy has always been, that it is *not* the best medium through which to prove the agency of an intelligent Creator . . . we deduce design from relation, aptitude, and correspondence of *parts*. Some degree therefore of *complexity* is necessary to render a subject fit for this species of argument. But the heavenly bodies do not, except perhaps in the instance of Saturn's ring, present themselves to our observation as compounded of parts at all."

Biology was a very different matter, and Paley milked it for all it was worth. The complexity of even the simplest living organism is prodigious, and the teleological delusion—the illusion of deliberate design for a purpose—ranges from impressive at one extreme to utterly stunning at the other. David HUME put it eloquently into the mouth of Cleanthes, his intelligent design spokesman: "All these various machines, and even their most minute parts, are adjusted to each other with an accuracy which ravishes into admiration all men who have ever contem-

plated them. The curious adapting of means to ends, throughout all nature, resembles exactly, though it much exceeds, the productions of human contrivance; of human design, thought, wisdom, and intelligence. . . . By this argument *a posteriori,* and by this argument alone, do we prove at once the existence of a Deity and his similarity to human mind and intelligence."

Hume's more intelligent protagonist, Philo, exposed logical flaws in Cleanthes' argument from design—it is indeed ultimately self-defeating—but the illusion of design in the living world remained bewitchingly potent. As long as there was no alternative explanation, merely exposing the logical fallacy seemed unsatisfying although (as Philo cogently showed) no more so than the design theory itself, properly thought through. Eighty years were to go by before Darwin came along with an idea so triumphantly fulfilling that it immediately overwhelmed all who understood it, and would have delighted Hume. Hume's *Dialogues concerning Natural Religion* could fairly be said to have uncovered a Darwin-shaped hole, gaping to be filled. The argument from design lost all right to life in 1859, although vestiges, born of misunderstanding, ignorance, and wishful thinking, are still kicking.

Teleonomy and the Impotence of Design. The problem that any theory of life has to solve—and which Darwinism uniquely solves—is the illusion of design: teleonomy. It is better not to call it teleology, because of the latter's unfortunate association with ARISTOTLE's final cause. The *Oxford Dictionary* defines *teleonomy* as "the property, common to all living systems, of being organized towards the attainment of ends." It is convenient to include all entities, whether living or manufactured, that look designed. An entity looks designed (and in some cases *is* designed) if it is composed of parts configured in a way that is statistically improbable, and efficient in some specified direction that an engineer might admire. Examples of teleonomic entities are birds and airplanes: both admirable flyers. If you shuffled the parts of either, a million random reconstitutions would not fly. The fact that birds and planes do fly in a sustained, directed, and controlled manner shows that each is the product of some very special process generating teleonomy. Only two such processes are known: design and natural selection. Humans understood design long before they understood natural selection, which is perhaps why many, to this day, can't understand natural selection. The prevalence of design in our human world acted as a smoke screen, retarding the discovery of natural selection.

Even among those who do understand natural selection, many mistakenly see design as a potential alternative that just happens to lack evidence. But design is ultimately no real alternative at all. It can serve only as a proximate explanation, never an ultimate or complete explanation of anything. A plane is designed by engineers, but the engineers themselves are teleonomic objects. Any attempt to explain a designer as designed by a higher designer inflates in an infinite regress. Darwin provides the only known escape from the regress: ultimately, engineers were "designed" by natural selection. Natural selection really can serve as an ultimate explanation for the heights of teleonomy, essentially because it creeps up on the problem from below. No other mechanism has ever been proposed that is even potentially an ultimate explanation.

To develop the point in another way, imagine, following a jeu d'esprit of Francis Crick and Leslie Orgel, that bacterial life on earth was deliberately seeded from elsewhere in the universe by an intelligent life form four billion years ago. If the bacteria used for this "directed panspermia" were themselves engineered (plausible, given that the technology to do this is less than a century ahead of ours), it would then be fair to say that life on earth originated by intelligent design. The point is that even in this hypothetical case, intelligent design would be only a proximate explanation. The designers on the distant planet must themselves have risen to their intelligent heights from somewhere. Maybe their life was seeded by yet another episode of directed panspermia from a yet older life-form? Fine, but the regress has to end somewhere. Eventually, complex and therefore improbable designers had to be bootstrapped from simpler beginnings by a stepwise incremental process: the kind of thing the philosopher Daniel Dennett calls a "crane" as opposed to a "skyhook."

If research in the well-financed Discovery Institute (see INTELLIGENT DESIGN THEORY) finally succeeded in uncovering convincing evidence that the bacterial flagellum was intelligently designed, which is highly unlikely, this would not—*could* not—be evidence for ultimate design by a primordial deity. It could only bespeak design by an extraterrestrial creature, who might well be so superior as to seem to us *godlike* but who must, originally, have been raised to those heights by a natural crane such as Darwinian natural selection.

Darwin's Powerful Idea. It makes sense to measure the power of a scientific theory as a ratio: how much it explains divided by how much it needs to assume in order to do the explaining. By this criterion, Darwin's theory of evolution by natural selection is arguably the most powerful idea ever to occur to a human mind. Think what it can explain (and that really means *explain,* in the fullest sense of the word): your existence and mine, as well as the form, diversity, and teleonomic elegance of all living things, not only on this planet but probably wherever in the universe organized complexity may be found. The explanatory work that the theory does, then—the numerator of the ratio—is immense. But the theory itself—the denominator—could hardly be smaller or simpler; you can write it out in a phrase: "nonrandom survival of randomly varying hereditary elements." That isn't quite how Darwin himself would have put it (see below), but it captures the

essence of his idea in a way that he would recognize and surely enjoy.

And how does it solve the riddle of teleonomy? How does natural selection ultimately succeed where design only proximally succeeds? The key is gradualism. There is no infinite regress, for evolution starts simple and becomes more complex in a series of small steps, no single one of which is too improbable to credit, although the end product—if you ignore the intermediates—is far too improbable. Intelligent design necessarily *starts* complex, for simple entities cannot be intelligent. In reality, by contrast, intelligence, like all other manifestations of teleonomic complexity, must have arrived late in the universe as the end result of a process of gradual evolution. Any suggestion that intelligence predates evolution immediately falls foul of the argument from improbability—ironically often advanced *against* evolution!—and shoots itself in the foot.

Who Thought of It First? The Darwinian solution to the riddle of life's existence is so powerfully simple, so felicitous to the modern mind, it is hard to understand why no one thought of it until the mid-nineteenth century. It is further surprising—and probably telling—that this great inspiration, which looks so elegant from the modern armchair, eluded centuries of philosophers, mathematicians, and polymaths. PLATO and Aristotle never even got close, fooling about with "essences," "ideal forms," and the sublimely vacuous "final cause." Gottfried LEIBNIZ and Isaac Newton gave us calculus (which might seem a more exacting achievement), but not an inkling of the reason for our own existence. Hume would surely have recognized natural selection as a profoundly great idea if it had occurred to him, but it never did. Having eluded this galaxy of all-time talent, the answer finally came, almost simultaneously, to two English naturalists, Charles Darwin and Alfred Russel WALLACE.

We must not forget Wallace. He gets a poor deal at the hands of posterity, partly through his own generous nature. It was Wallace who coined the word *Darwinism*; he regularly called it "Darwin's theory," and he described himself as "more Darwinian than Darwin." But the main reason we know the name of Darwin more than Wallace is that a year after the Darwin/Wallace papers, Darwin went on to publish *The Origin of Species*. The *Origin* not only explained and advocated the Darwin/Wallace theory of natural selection, it also—and this really needed book-length treatment—set out the multifarious evidence for the *fact* of evolution itself.

Claims of priority are sometimes advanced on behalf of Patrick Matthew, Edward Blyth, and W. C. Wells, compatriots of Darwin and Wallace, and their near contemporaries. They independently proposed something like natural selection, in various restricted contexts, but only Darwin and Wallace grasped its huge significance as the driving force of all evolution and the ultimate answer to the riddle of life.

In any case, the priority we are talking about concerns only natural selection, not evolution itself, which is, of course, a much older idea. The distinction between the fact of evolution and the theory of natural selection is sometimes not clearly understood, and it will be explained in the next section.

The Fact and the Theory. The fact of evolution is the historical certainty that species are descended from other species, and that all species are cousins, tracing back along the branches of a family tree to a single remote ancestor. The French naturalist Jean Baptiste de LAMARCK, who is often touted as his predecessor, lacked Darwin's clear vision of a branching tree. Lamarck thought species were arranged on something more like a ladder than a tree, each one transforming itself into the species on the next rung up. Darwin had no use for ladders, whereas the image of the branching tree was so important to him that it constitutes the only illustration in *The Origin of Species*.

If the fact of evolution were limited to the existence of a branching family tree in which all species, no matter how different, are cousins, it would still need explaining, but something akin to random change would suffice. Plenty of physical processes branch, from river deltas to certain grown patterns in crystals. But random evolution is dramatically ruled out by teleonomy. Living organisms are "good" at doing things. Birds, bats, and insects are good at flying; fish, whales, dugongs, turtles, and squid are good at swimming; cheetahs and antelopes are good at running; moles and wombats are good at digging; trees are good at standing tall in all weather; and weeds are good at spreading.

Such obvious skills are tips of icebergs. All living creatures are "good" at the biochemical, cellular, and physiological processes that run their bodies, and at the embryological processes that originally built them. Despite revealing imperfections (of the kind that no intelligent designer would perpetrate), living creatures carry that overwhelmingly powerful impression of good design defined as "teleonomy."

The Origin of Species is a doubly important book, for it combines Darwin's encyclopedic mustering of the evidence for the fact of evolution with his explanation and advocacy of natural selection as the driving mechanism that generates teleonomy.

Classical Darwinism. Knowing nothing of genes beyond the folk wisdom that like begets like, Darwin treated natural selection at the level of organisms. He took the Malthusian point that in every generation there is overproduction. More offspring are born than are needed to replace the parental generation, in some cases grossly more. This inevitably generates competition, the "struggle for existence" in the famous phrase Darwin and Wallace independently coined. The individuals best fitted to survive the struggle in each generation contribute disproportionately to the next. Future generations inherit those attributes that fitted their parents to survive and pass them on. So more favored "varieties" (Wallace's word) or "races" (Darwin's) will tend to pre-

vail, and this explains the improvement of evolutionary adaptation.

To Wallace and Darwin, in this context, "variety" and "race" meant not a local group of finches, say, but "that set of individual finches whose beaks were hereditarily stronger than usual." Darwin's use of "race" in the subtitle of *The Origin of Species* is sometimes dangerously misread: *The Preservation of Favored Races in the Struggle for Life.* As with Wallace's "variety," Darwin was using "race" to mean "that set of individuals who share a particular hereditary characteristic," such as sharp talons, *not* a geographically distinct race like the Hoodie Crow. By "variety" and "race" Wallace and Darwin meant what we would nowadays call "genetic type," even what a modern writer might mean by a gene (see "Neo-Darwinism," below).

Both Wallace and Darwin acknowledged the inspiration of Malthus for their powerful notion of the struggle for existence setting up the competition in which the fittest would survive and reproduce. Wallace's peroration could have been Darwin himself writing, and it will serve as our summation of classical Darwinism:

> The powerful retractile talons of the falcon and the cat-tribes have not been produced or increased by the volition of those animals; but among the different varieties which occurred in the earlier and less highly organized forms of these groups, those always survived longest which had the greatest facilities for seizing their prey. Neither did the giraffe acquire its long neck by desiring to reach the foliage of the more lofty shrubs, and constantly stretching its neck for the purpose, but because any varieties which occurred among its antitypes with a longer neck than usual at once secured a fresh range of pasture over the same ground as their shorter-necked companions, and on the first scarcity of food were thereby enabled to outlive them. Even the peculiar colors of many animals, especially insects, so closely resembling the soil or the leaves or the trunks on which they habitually reside, are explained on the same principle; for though in the course of ages varieties of many tints may have occurred, yet those races having colors best adapted to concealment from their enemies would inevitably survive the longest.

There is essentially no difference between Darwin's and Wallace's ways of expressing natural selection. Both clearly saw its huge importance. Neither saw it in the light of modern genetics, for the obvious reason that they didn't know modern genetics. This is where neo-Darwinism enters the story.

Neo-Darwinism. Genetics is the only subject in biology that Darwin got badly wrong. In other areas, he showed astonishing prescience, even down to fine details; his passages on ecology, on "entangled banks" and webs of interaction, sound uncannily modern. But his genetics was the genetics of his time, and that means pre-Mendelian and pre-Weismannian genetics. Advances in genetics have spawned, in successive episodes, two neo-Darwinisms.

The first neo-Darwinism dates from the 1890s, and was mainly associated with the great German biologist August Weismann and his idea of the genetic material as an autonomous river flowing through time, with organisms as its temporary conduits. Weismannism is diametrically opposed to Lamarckism. Weismann's genetic river flows on inviolate, and acquired characteristics are never inherited. In slightly different language, Weismannism is orthodoxy today.

The second neo-Darwinism, the one to which the name is now normally applied, was initiated by the three fathers of population genetics in the 1920s and 1930s: R. A. Fisher, J. B. S. Haldane, and Sewall Wright. They substituted Mendelian *particulate* genetics for the blending inheritance accepted by Darwin and his contemporaries. After Mendel, genes do not blend in an individual when they come together from its father and its mother. Instead, each gene is a hard, discrete entity that is either present or absent in each individual, and is either passed on or not passed on to a given child. Mendelian genes are yes/no entities that you can *count.* Evolution, on the Neo-Darwinian view, is statistical change in gene *frequencies* in populations.

Sexual reproduction shuffles and reshuffles the discrete Mendelian genes in a population. We can, therefore, visualize a continually stirred "pool" of genes. Gene pools may be isolated from other gene pools, either because they belong to different species that can't or won't interbreed, or because they are separated by geographical barriers. The latter kind of isolation, as we shall see, is the usual prelude to the former in the origins of new species.

Some changes in gene frequencies are caused by nothing more than luck, that is, random genetic drift, and this is especially significant in small populations. Sampling error is one way to think of it. The gene pool of each generation is a reshuffled sample of the previous generation's pool. In a large population, the sample of children is large, and gene frequencies will resemble the parental generation's. But a small sample is not representative. It is subject to random sampling error. As the generations go by, random drift can lead to some alleles (alternative versions of a gene competing for the same chromosomal locus) disappearing from the gene pool by bad luck. When all the alleles at a locus but one have disappeared, the remaining one is said to be fixed. It has gone to fixation.

From a Darwinian point of view, such random fixations constitute a kind of null hypothesis, departures from which command our interest. Fixation is not always random. In adaptive evolution, an allele goes to fixation not because it is lucky, but because it has what it takes. That normally means it contributes to the embry-

onic development of a successful body, good at surviving and reproducing, or otherwise good at passing on copies of the same allele. That, in modern terms, is natural selection—neo-Darwinism. It is the nonrandom survival of alleles in gene pools by virtue of their phenotypic effects on organisms. Unless we are molecular geneticists, we notice it only through the consequent evolution of externally visible phenotypes.

Diversity and *The Origin of Species*. Although the illusion of design is the aspect of Darwinism that most acutely impinges on unbelief, it is not the only aspect Darwin explained. The diversity of life—the branching tree, which, as already mentioned, Darwin singled out for the only illustration in *The Origin of Species*—was one of his major preoccupations, as witnessed by the very title of that great book. And diversity powerfully affects believers, too, because the huge array of animals and plants, making their livings in such a dazzling plenitude of ways, seems to amplify the seductive illusion of design.

The number of species that have ever lived is estimated in the hundreds of millions or even billions, and all are descended from a single ancestor. A very large number of branching events have happened, therefore, and these are called—at least for the sexually reproducing organisms with which we are most familiar—speciation events. Speciation is the process whereby a new species comes into the world—the "origin of species"—by bifurcation of an existing species.

Sexual reproduction tends to oppose speciation. It continually recombines the genes in a gene pool, and this smothers any tendency for a subset of the gene pool to move off in its own evolutionary direction. Some kind of accidental separation is the normal prerequisite to speciation. Once split, two subpopulations are free to pursue separate evolutionary courses, following different selection pressures or even just drifting in different directions. The obvious accidental separation is geographical, and there are two ways in which this can happen. The geography can change, as when an earthquake raises a mountain range, a volcano makes a new island, or a drought shrinks a large lake down to a residue of smaller ones; or the organisms themselves can move, as when the ancestors of "Darwin's finches" were blown, by accident, from South America to the Galapagos Archipelago, or when a tree felled by a hurricane drifts, with a cargo of unwitting iguanas, to a distant shore.

Such events are rare, and it is crucial to the whole theory that they should be. If they were common, gene flow would not be interrupted and the incipient species would be genetically bound together and prevented from diverging. In those rare cases, successive incidents of gene flow are separated by intervals big enough to allow the budding species to separate from its origin species for long enough that, when the two do meet, they can no longer interbreed. When this condition obtains, speciation is complete and a new species, by definition, is born. The intermediate case is where separated populations are reunited sufficiently soon that interbreeding is still possible but hybrids are at a disadvantage, perhaps nearly infertile. This has prompted an additional, more controversial suggestion: natural selection, by penalizing any inclination to hybridize, accelerates speciation. Neat though it is, this reinforcement theory is not widely supported.

Speciation that results from geographical separation is called allopatric. Sympatric speciation is more controversial but it has been argued that insects, at least, may commonly speciate even if there is no geographical barrier to start the process. It seems, though, that there has to be some kind of initial barrier, even if it is only the separation between one food plant and another.

Species is the only rank in the taxonomic hierarchy with an objective definition. Once two populations can no longer interbreed, they are defined as different species. Speciation is the crucial step in evolutionary divergence. Every degree of separation above the species level—between apes and monkeys, between marsupial and placental mammals, between animals and plants—began as a single bifurcation: a speciation event, probably following an accidental geographic splitting of one breeding population. Recognizing this was one of Darwin's many great achievements.

Darwin's Other Theory. Perhaps from motives of prudence, Darwin omitted *Homo sapiens* almost totally from *The Origin of Species*. He was holding his fire for *The Descent of Man* (1871), which is really two books in one. Before launching his treatment of human evolution, Darwin expounded his "other theory," sexual selection, mentioned in *The Origin* but not fully developed. It is debatable whether sexual selection is as distinct from natural selection as Darwin's terminology suggested, but it can have conspicuously different results.

On any account of Darwinism, survival is only a means to the end of reproduction (or, in the neo-Darwinian formulation, gene survival). A penis is not an adaptation to individual survival; it is an adaptation to reproduction (or for propagating the genes that built the penis). For Darwin, however, a penis is (normally) shaped by natural, not sexual selection. Sexual selection produces adaptations whereby members of one sex compete with each other for members of the other. A penis would be shaped by sexual selection only if females choose males by comparing their penises, or if males fight other males for females by fencing with their penises. Iconic examples of sexually selected traits are the extravagantly beautiful tails of male birds of paradise (whereby they compete to be chosen by females) and the asymmetrically huge claws of fiddler crabs (organs for intimidating other males and indirectly competing for females). Sexually selected traits are typically larger, brighter, louder, and more wasteful than utilitarian adaptations to personal survival. The neo-Darwinian "gene's-eye view" sees both as adaptations to assist the survival of the genes that made them.

Only a Theory? Professional opponents of Darwinism (and the word *professional* is appropriate to these advocates and their richly financed, professionally spun campaigns) continually change the ground from which they snipe. In the United States today, they have discovered that the phrases "only a theory" and "never been proven" work readily to impress gullible audiences. The propagandists themselves know perfectly well (if their audiences do not) that *theory* and *proven* have technical meanings that, properly understood, nullify the propaganda point being made. Of course, they bank on their audiences *not* understanding this properly. Every scientific fact is, in this technical philosophic sense, a theory awaiting falsification (see FALSIFIABILITY). A well-established fact is a theory that has survived a bombardment of falsification attempts to the point where withholding the accolade "fact" becomes pedantic sophistry. Such is the current status of the fact of evolution.

Similarly, proof is something that mathematicians do when they deduce a conclusion as necessarily following from premises. Scientific theories about the real world, even "obvious" theories like the theory that the earth is round and orbits the sun, are not proved in this sense, although mathematical deduction often enters into their details.

Philosophical technicalities aside, evidence establishes the fact of evolution as strongly and securely as any fact in the whole of science. Since evolution mostly happened before we were born, a helpful simile is the detective who arrives at the scene of a crime after it is committed and solves it from the clues that remain. The difference is that the fact of evolution is a more secure "open-and-shut case" than any crime in the annals, and by a margin that exceeds all computation. The evidence for evolution is truly massive, and it piles on from all directions. As we detectives survey life, both extant and fossilized, we are overwhelmed by literally millions of observations that are exactly as they should be if evolution is, indeed, a fact, and natural selection did it. The distribution of DNA, of proteins, and of other molecules, is exactly as it should be if Darwinism is true. The distribution of animals and plants and fossils over the islands and continents of the world is exactly as it should be; the distribution of fossils in geological time is exactly as it should be; the distribution of bones, muscles, hearts, brains, and all other meticulously compared anatomical features is exactly as it should be if evolution is a fact. In the ordinary sense of the words *fact* and *proven*, evolution is a proven fact.

RICHARD DAWKINS

DEATHBED CLAIMS CONCERNING UNBELIEVERS. One of the most long-lived pieces of popular evangelical apologetics is the story of the dying unbeliever, in a panic at the prospect of his imminent descent into hell, who wails out his last-minute repentance for having turned away from the Lord. For more than two hundred years all manner of freethinkers, be they atheists, deists, skeptics or humanists (see FREETHOUGHT; ATHEISM; DEISM; SKEPTICISM; HUMANISM), have been said to have died in pitiful remorse for their temerity in criticizing the truths of the Christian religion.

Stories of "infidel deathbeds," as they came to be known, were first gathered together in the book *Closing Scenes, or, Christianity and Infidelity Contrasted in the Last Hours of Remarkable Persons* by Rev. Erskine Neale, a rector of Kirton, Suffolk, England, and a sometime prison chaplain. This book was little more than a popular recycling of tales of dramatic deathbed cries of anguish by distraught freethinkers. The most popular, indeed ubiquitous, stories concerned Thomas PAINE and VOLTAIRE. Some of the stories Kirton gathered together were venerable even then. And their general theme is older still, reminiscent of the old stories of heretics confessing their sins as the flames licked around them.

The genuine, widespread bemusement over the calm death of David HUME helped to generate the later infidel deathbed tales. Hume's longtime friend James Boswell found it incomprehensible that Hume could die in such good humor. He asked Hume if it were at least possible that there was an afterlife. Hume replied that it was possible a piece of coal could be put on a fire and not burn, but it was "a most unreasonable fancy" that he should live forever. He quipped that the only positive aspect of immortality he could imagine would be living to see the "downfall of the prevailing system of superstition."

Whereas Hume attracted incredulity at the manner of his death, Voltaire was the target of many fabricated tales of his ranting for a priest in his death throes. The stories of Voltaire's deathbed agonies were largely the result of a need for vengeance on the part of those unable to get the better of him while he lived. The most reliable accounts of his death say that Voltaire refused absolution and thrust his hand against an importunate Curé, saying, "Let me die in peace." Voltaire's last words were spoken to his valet. He said simply, "Adieu, my dear Morand, I am gone."

In an interesting twist to the tradition of infidel deathbed stories, there has even been a long career of stories about Voltaire's house being used as a headquarters of the Geneva Bible Society. This story is as baseless as are the stories of his deathbed repentance.

The stories told of infidel deathbeds, popularized by people like Neale, had gained sufficient currency by the middle of the nineteenth century for freethinkers to feel the need for a response. Knowing that he had a chance of dying in the cholera epidemic then sweeping through London, the freethinking journalist Henry HETHERINGTON took the time to draw up a testament of his beliefs. As a leading opponent of church privilege and campaigner for press freedom, he knew he would probably be the subject of an infidel deathbed story. He wrote

the testament two years before he died and signed it three days before his death in the presence of a friend, Robert Cooper, who left it at the office of their paper, the *Reasoner*. The testament began:

> All life is uncertain, it behoves every one of us to make preparations for death; I deem it therefore a duty incumbent on me, ere I quit this life, to express in writing, for the satisfaction and guidance of esteemed friends, my feelings and opinions in reference to our common principles. I adopt this course that no mistake or misapprehension may arise through the false reports of those who officiously and obtrusively obtain access to the deathbeds of avowed infidels to priestcraft and superstition; and who, by their annoying importunities, labor to extort from an opponent, whose intellect is already worn out and subdued by protracted physical suffering, some trifling admission, that they may blazon it forth to the world as a Deathbed Confession, and a triumph of Christianity over infidelity.

Hetherington went on to reaffirm his rejection of any sort of transcendental temptation. Another nineteenth-century freethinker, Ernest RENAN, was sufficiently worried by the scenario of a deathbed conversion story that he wrote in his autobiography: "If such a fate is reserved for me, I protest in advance against the fatuities that a softened brain may make me say or sign. It is Renan sound in heart and head, such as I am now, and not Renan half destroyed by death, and no longer himself, as I shall be if I decompose gradually, that I wish people to listen to and believe."

Many prominent nineteenth-century freethinkers felt this need to insure their posthumous reputations against infidel deathbed stories. It was this need that motivated the English journalist and freethinker George W. FOOTE to compose *Infidel Deathbeds* in 1886. This work was little more than a collection of testimonies of prominent freethinkers, or of those who attended their dying moments, as to the freethinkers' beliefs immediately prior to death. To take one example, the section on the death of essayist and novelist Winwood Reade ends: "'From beside the grave opening to receive him,' said his life-long friend Moncure D. CONWAY, 'he warned these life-long victims that the only victory over death is to concentrate themselves on life.'" *Infidel Deathbeds* clearly satisfied a need, remaining in print for half a century, being revised, enlarged, and reissued many times until the 1930s.

But the popularity of these deathbed tales is not a historical oddity from the nineteenth century. To this day, many evangelicals recount tales of the dramatic last moments of Charles DARWIN—a particular favorite—Bertrand RUSSELL, Jean-Paul SARTRE, and even Gandhi, in the belief that such tales count as evidence against them. Evangelical Web sites abound with tales of atheists crying out in their death throes. Even today Paine remains one of the favorite targets. One site quotes Paine as saying: "I would give worlds if I had them, that *The Age of Reason* had never been published. O Lord, help me! Christ, help me! . . . No, don't leave; stay with me! Send even a child to stay with me; for I am on the edge of Hell here alone. If ever the Devil had an agent, I have been that one." No source for this statement is given and there is no evidence whatever that Paine ever said this.

Stories of Paine's deathbed retraction can be traced back to the 1840s, when a newspaper article claimed to recount his deathbed wail of anguish. The article, appearing more than thirty years after Paine's death, was purported to have been written by Bishop Benedict J. Fenwick, who had himself only recently died. All the evidence suggests the article was bogus, not least because it perpetuated the old untruth that Paine was an atheist. Anybody who had actually attended Paine's death would presumably have known he was a deist who specifically and repeatedly repudiated atheism.

Another popular target of infidel deathbed tales is Charles Darwin. Many of these tales rely on the dubious testimony of an English evangelical and socialite, Elizabeth Cotton. After a career as a temperance campaigner, Cotton married into money and reinvented herself as a lady of leisure, going through the money of two husbands. Even after remarrying, she retained the title derived from her first husband: Lady Hope. In August 1915, four years after being declared bankrupt, Lady Hope sold a story to the Boston-based Baptist magazine the *Watchman-Examiner* concerning a visit she claimed to have made to Darwin as he lay dying in 1882. She recounted his last-minute conversion to Christianity and his declaration of admiration for the Bible. In fact, Lady Hope was not at Darwin's deathbed at all. It is possible she was granted a visit late in 1881, about six months before he died, but even that is uncertain. Henrietta Darwin, Charles's daughter, who *was* at his deathbed, repeatedly denied Lady Hope's story, but to little avail. And Henrietta could not recall Lady Hope ever visiting Down House. Assuming that the visit took place, no more can be read into it than Darwin graciously humoring a persistent caller.

Like most resilient myths, infidel deathbed stories can adapt to new times. The fashion for "near-death experiences" among popular New Age outlets has given the older infidel deathbed theme a new twist. The best illustration of this is the use made of A. J. AYER, who, in 1988, was technically dead for four minutes. A widely reported dream he had while returning to consciousness quickly took on a life of its own as evidence of a cocksure atheist having a brush with God. One source has Ayer admitting to his surgeon that he saw "the Supreme Being." When Ayer did in fact die, in June 1989, he died an atheist, remaining, according to those who were with him, "determinedly calm and cheerful."

The first point about the infidel deathbed stories is how primitive they are. It is a close relation of the prejudice that you don't find atheists in foxholes. The appeal of these stories rests on the core supposition that atheists could not face death with their convictions unchanged. It is a simplified version of PASCAL'S WAGER, which suggests that belief in God is the safest bet, in that if it is true one has secured immortality, while if it is false one has lost nothing. These prejudices only work if one's own religious belief is little more than a self-serving divine insurance policy. This unflattering understanding of religious faith is why the more sophisticated theologians and apologists have not resorted to the tales of infidel deathbeds.

But in a strange sort of way, the recipient of an infidel deathbed story is being paid a sideways compliment. It is, after all, recognition of that person's significance as a thinker and activist that those who disagree with him should seek to diminish his contribution with a story about a cowardly death. Many people whose works were placed on the Index of Forbidden Books were happy that the Roman Catholic Church had seen their work as sufficiently challenging to justify such a response. It was, in that sense, a badge of honor. The same can be said of recipients of infidel deathbed stories. Over the two centuries during which infidel deathbed stories have been popular, Paine remains the most frequent target, with Darwin a close second.

DEATH OF GOD THEOLOGY. Though it takes its name from the breathless proclamation of Friedrich NIETZSCHE's mad prophet in *The Gay Science*, Death of God theology—prominent in the 1960s but making a comeback—derives its inspiration from several sources. It began as one of several neoliberal reactions to the neo-Orthodox theology of Karl Barth, which dominated mainstream Protestantism through the 1950s. Barth, a revisionist Calvinist, had reaffirmed the traditional Reformed and Lutheran suspicion of pietistic subjectivism, since such dubiously claimed direct consciousness of the divine had led, starting with Friedrich Schleiermacher, to subjective culture Protestantism, which for Barth blurred the line between divine revelation and human reason and culture. Barth had seen such liberal theology drift with shocking ease into the support of German imperialism in World War I, and this galvanized him to affirm the absolute transcendence of God as the Wholly Other, who had spoken definitively and objectively above the din of human voices in his living word, Jesus Christ. Barth affirmed the Weberian "disenchantment of the world" so as to make clear the difference between sinful man and the holy God who had bridged the gap between them in Jesus Christ alone.

But in the minds of many this left the world an airless moonscape, bereft of God. A few thinkers conceived a bleak but bracing vision. Drawing upon the prison writings of Dietrich Bonhoeffer, theologians including Harvey Cox, Anglican bishop John A.T. Robinson, and philosophical theologian Paul M. van Buren strove to forge a way in which contemporary Christians might learn to "speak in a secular fashion of God," or to "live without God before God," whence the alternate name for the movement, secular theology, arose. They urged that Christian ethical concerns be translated into secular terms, minus religious language, concepts, or warrant, and yet for religious reasons. This secularization of Christianity they saw as the consistent outworking of long-term trends begun in the scripture itself. In *The Secular City*, Cox sees the gradual disenchantment and rationalization of the world as a direct extension of the Israelite belief that God was freely active in ongoing history, not a divine embodiment of the cyclical forces of nature and therefore a prisoner to them. And when the apostle Paul teaches that Christ has freed humanity from the domination of the angelic principalities and powers who ruled us through religious regulations (a Gnostic motif), Cox claims it as a major step toward eventual secularization. God was already dying as humanity began to mature, but, as Nietzsche's prophet discovered, the light from that supernova would take many centuries to dawn on the run of mankind.

Cox urged upon Christians a moratorium on the use of the word *God* until it could be freed from the terrible and destructive associations it had gathered like barnacles over the millennia. Jewish thinker Martin Buber, in his *The Eclipse of God*, contemplated such a vow of theistic silence, but decided that faith cannot do without the word. Another Jewish theologian who did find himself a major voice of the Death of God movement was Richard L. Rubenstein, who saw the Holocaust as the definitive proof that Jews' belief in their role as God's chosen was not only false but pernicious. If Auschwitz could be considered compatible with the love or justice of God, then these terms are meaningless. And as long as Jews believe themselves, even in humility, to possess a special holiness, they are inevitably making themselves targets for rivals who will take that claim seriously enough to covet it and try to wrest it from Jews by destroying them, as

witness the mimetic envy of both Christians and Nazis, self-perceived super-races that could not bear to share this honor with Jews.

William Hamilton saw Western culture in the 1960s as undergoing a collective dark night of the soul, suffering from the hiddenness of God. To Hamilton the only gleams amid the darkness were playful and optimistic developments in the secular arts, including the work of Michelangelo Antonioni and the Beatles. Some of Hamilton's essays seem embarrassingly facile in retrospect, and yet he was ahead of his time in recognizing that religious thought could never provide a comprehensive system of explanation. Nonetheless, Christians must and may take the historical Jesus, as Bonhoeffer understood him, as "the Man for Others," as their Lord and guide, the only token of divinity left us as we serve humanity in its suffering.

Paul M. van Buren did not relish his inclusion among the Death of God theologians, but the resemblance is undeniable. He approached modern theology from the perspective of analytical philosophy. Ultimately, he reasoned, Christianity in our time can retain no more than the distinctive *blik* or evaluative standpoint of Christianity, with no supernatural underpinnings. Secular Christianity is rather a way of seeing the world through the gospel. It is a vision of life, not a theory about the world, more of an agenda than a creed. It was not long, however, before van Buren, influenced by the thinking of William James, found his way back into a more traditional Christian identification, albeit one entirely colored by and tailored to the Jewish-Christian dialogue.

Thomas J. J. Altizer was by far the most radical of the Death of God theologians (or, as conservative Lutheran John Warwick Montgomery, who energetically debated Altizer, dubbed them, the Theothanatologists). Altizer called the bluff of traditional Christianity's claim to take history seriously (unlike, e.g., Buddhism). If Christians mean it, then in the modern world theologians must stop neutralizing and retreating from (secular) history into an interior fairyland of *Heilsgeschichte* or so-called salvation history. They must no longer ignore what has been revealed about reality by such thinkers and visionaries as Nietzsche, Sigmund FREUD, Ludwig FEUERBACH, and William Blake. Christian faith must take these insights into account. When it does, it realizes that it must stand against transcendence and must will the death of God. For Altizer it comes down to this radical negation instead of, say, some convenient redefinition of the God concept. This is because "God" is inseparable for us from what the word has come to mean in experience. And the experience we have of the transcendent God is one of alienation. What other "relation" could one possibly have to the Wholly Other? This God must die.

To proclaim and will the death of God is a Christian thing to do, Altizer proclaimed. In fact, those who do so are more entitled to the name "Christian" than most traditional and modern theologians, who have tried to reverse the apocalyptic thrust of Jesus's proclamation. What Jesus was getting at by proclaiming the imminent reversal of all things (including the God who once was far off, i.e., transcendent, but now is made near) is what we refer to in modern conceptuality as the self-emptying by God of his transcendence or spirit.

The myth of the Edenic Fall denotes the mutual alienation of God and humanity. Thus humanity as sinful and God as transcendent are both ipso facto *fallen*. We experience this God as the creator or divine ground of this world. The transcendent Creator transcends his creation. Thus if an eschatological reversal is to be truly *new* (as by definition it must be), and not a mere return to previous equilibrium—a homecoming to Eden—the final form of God must be immanent and not transcendent. How does this change occur? The incarnation of God in Christ occurs at the Resurrection, which is to be understood as a downward, not upward, motion. In Christ God became forever "enfleshed." The Resurrection is not an ascent into heaven (a reversal of the incarnation, a return to transcendence), but rather a descent into hell—where God stays, to be met in our experiences of the darkness and horror of the world.

Drawing on Buddhism (see BUDDHISM, UNBELIEF WITHIN), Altizer seems to make the Christian life that of a bodhisattva. The acceptance of the end of God's transcendence means also the yielding up of the autonomy of ego or self, as well as immersion in the world's darkness. The new "indifferent" (impartial) solidarity with all beings in that dark reality will issue in undiscriminating compassion (*karuna*), as in Buddhism.

Death of God theology enjoyed a brief but spectacular vogue in the 1960s, then died out soon after. In the 1980s and 1990s it staged a comeback; like Nietzsche's prophet, it seemed to have arrived before its time. But in the wake of the deconstructive antiphilosophy of Jacques Derrida and Paul de Man, Death of God theology seemed to make more sense than ever before. Philosophy had caught up with it. New theologians in this camp would include Mark C. Taylor, Charles E. Winquist, Carl A. Raschke, Robert L. Scharlemann, and the later Don Cupitt.

With Derrida, who banished any notion of a "transcendental signified," a logos-center or meaning-center external to language, deconstructive theology proclaims the Nietzschean Gospel of the death of God. But it also proclaims the death of man, of woman, of a transcendent consciousness as a mirror reflecting a pure vision of truth. Deconstruction sees all language as cross-referential, referring only to language. All reality is a textual field, a flat surface with much depth beneath it, a depth of unsuspected meanings, but no height, nothing above it to which it points.

To unpack this a bit, the death of God means, for the theology of deconstruction, that the divine has been poured out into the human, the profane, the secular, which henceforth is seen to glow with a kind of "trace,"

a witch-fire radiance of the lost sense of holiness. What once was there to be worshiped is now present only in its conspicuous absence. Religious worship must now be like the singing of the Lamentations of Jeremiah amid the ruins of the Temple of Solomon: over the debris one can make out the word *Ichabod* ("the Glory has departed"), and in that absence is the lingering trace of the holy—not a Holy Ghost, but a ghost of holiness. The rawness of the profane, which is all that is left to us in a world with no transcendent reference, somehow yet retains the hint, the echo, the trace of the holy that is gone.

With the death of any transcendent source of meaning or value outside language, with the revelation that every concept is only a metaphor, that even logical argument is only narrative, there can be no religious authority. No book can be more authoritative than any other, because there is no word of God. No particular reading of any book can be recovered as the true or binding one. All exists simply as text, a field of signifiers. We as readers break a path through the text as we read, but we can never be sure we are doing more than playing a word-search puzzle, imagining chains of signification where none were intended by the writer. Deconstructive theologians and critics thus have new respect for the subversive reading strategies of the Kabbalah, which did not hesitate to read the text backwards, and as acronyms, and as puzzles, and by means of puns.

Deconstruction abhors logocentrism, the abstraction of some element of the text and the idolatrous elevation of it as the key to the meaning of the text. The meaning of the text is the text itself. If Altizer proclaimed the death of God, today's deconstructive theologians proclaim the death of the logos, or word, of God.

ROBERT M. PRICE

DE CLEYRE, VOLTAIRINE (1866–1912), American anarchist, freethinker, and sex radical. Born November 17, 1866, in Leslie, Michigan, to a very poor family, Voltairine de Cleyre was the granddaughter of an abolitionist. Her father was a French-born socialist and freethinker (see SOCIALISM AND UNBELIEF; FREETHOUGHT). The strikingly intellectual child began a lifetime career as a poet at age six. Her education ended with three years in a convent school, where she was enrolled for practical reasons. Her training there was solid, but her opinion of Catholicism was that it turned bright young personalities into "prostrate nonentities." She declared herself a freethinker two years after graduating.

De Cleyre (her adopted spelling) wrote for freethought papers and lectured for the AMERICAN SECULAR UNION. From 1889 to 1910 she lived in Philadelphia, where she helped establish the city's anarchist-based secular clubs: the Ladies' Liberal League (1892), the Social Science Club (1899), and the Radical Library of Philadelphia (1905). Internationally acclaimed thinkers argued and taught at these clubs, including Pëtr KROPOTKIN, Emma GOLDMAN, and Edward Drinker Cope. Because of her charisma and intellectual prowess, de Cleyre was a key factor in the unusually favorable public persona earned by the anarchists of Philadelphia. She earned a meager living as a teacher of piano, French, and English to immigrants, especially Russian Jews. She learned Yiddish and invested much energy in understanding Jewish life and issues.

Though she contributed to dozens of periodicals, her main venues included the *Firebrand*, *Free Society*, *Freedom* (London), *Mother Earth*, and especially *Lucifer, The Light-Bearer*, to whose editor, Moses HARMAN, she was ideologically close. De Cleyre was a traveling lecturer from around 1886, making tours of the Midwest, the eastern United States, and Canada, and traveling also to Britain and Scandinavia in 1897 and 1903.

De Cleyre's anarchism was consistently predisposed toward the individualist school, but from 1897 she preached an anarchism explicitly "without adjectives." She held that general conceptions of world and universe do not inherently impede the struggle for human equality; that various atheistic or religious ideologies and different economic structures could be advantageously tried, so long as the spirit of individuality was encouraged and preserved. She held that both philosophical and revolutionary methods—ranging from Tolstoian nonresistance (see TOLSTOY, LEV NIKOLAYEVICH) to the assassination of heads of state—should be considered case by case as practical conditions were addressed. Considering marriage the sexual enslavement of women and an impediment to personal development for both sexes, she defended and practiced varietism (nonmonogamy) and criticized traditional domesticity and monogamy (see SEX RADICALISM AND UNBELIEF). She also defended the cause of labor, but opposed the concentration of power in the hands of either union officials or political parties. In this spirit she actively supported the most radical of unions, the Industrial Workers of the World, and the Mexican Revolution.

For most of her adult life, de Cleyre had health problems that punctuated her activities, including chronic sinusitis, complicated by one or more infectious diseases and aggravated by suicidal melancholia around 1894 and an abortion in 1897. She came near death after being shot by a deranged former pupil in 1902, and again from sickness in 1904. Her refusal to testify against her 1902 assailant and her efforts to defend him from prosecutors moved many hearts. She moved to Chicago in 1910, where she died from complications of infected sinuses on June 20, 1912.

ROBERT P. HELMS

DEISM. A new understanding of the universe which rose to prominence in Europe during the seventeenth century in the wake of the progress of science, deism was pioneered especially by Copernicus through to Isaac Newton. Deism also owed much to the fracturing of Christian theology at the same time, particularly with respect to doctrines such as the Trinity. Deism is, in the main, a European movement, and relevant only to the Christian tradition against which it was reacting. Most of the influential leaders of the Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE) were deists. The first known use of *deist* was in 1564, by the French Calvinist Pierre Viret, who used it to denote the person who believes in god in the abstract sense of being the creator of the universe, but who denies the divinity of Jesus Christ and other significant parts of Christian dogma. Viret castigated such people as wicked atheists (see ATHEISM). The word appeared in English for the first time in 1621 in Robert Burton's influential work *Anatomy of Melancholy*. Unlike Viret, Burton's use of the word was neutral. The first person to describe his own views as deist was the Englishman Charles Blount. It was not until 1682 that *deism* was used, and this was in John Dryden's preface to his poem *Religio Laici*.

The first important fact about the people now generally called deists is that they differed from each other as much as they agreed. It is easier to see a common program in deism when we examine what they rejected, rather than what they embraced. Generally speaking, the thinkers we now call deists rejected the mystical and revealed elements of Christianity such as miracles (see MIRACLES, UNBELIEF IN), original sin, the Virgin Birth, and the Trinity. In its place, deists advocated

what they saw as a natural religion, which emphasized mathematical laws and natural harmony as had been uncovered by Newton, and which could be understood through the use of REASON. In most cases, deists advocated religious toleration, arguing that all religions were, to some extent at least, a representation of the divine truth in the universe. Deists tended to believe in a creator, but in most cases denied that the creator took any part in the day-to-day running of the universe. God was implicit in the universe but had no part in running it or in overseeing the moral lives of humans. And, in what now seems an odd anomaly to this package of ideas, most deists retained some belief in an afterlife (see IMMORTALITY, UNBELIEF IN).

Few of the principles of deism were original to those who adopted the label. Most deist ideas had been aired at some time by the Greeks and Romans. CICERO in particular articulated most of the views later taken up by deists in his work *De Natura deorum*. It is no coincidence that Cicero was an especially popular historical figure in the eighteenth century, when deism was at its height.

Two developments were significant in the rediscovery of these ideas and their reorganization into what became known as deism. One was the scientific breakthroughs of Galileo GALILEI and Newton, which opened up a universe infinitely larger and more complex than the simple, geocentric universe presented by Christian theology. The other factor was the growing disgust at the slaughter of heretics and schismatics in the name of religion in the century leading up to, and culminating in, the Thirty Years' War, which ended in 1648. The new scientific thinking and the wars of religion had both highlighted the difficulties in linking specific items of doctrine to religion. Deism was an attempt to retain what was seen as religion's core insight minus the doctrinal accretions.

One of the first statements of what is now called deism came in *De Veritate* (1624) by the Englishman Lord Edward Herbert of Cherbury. He did not speak of deism, but of "natural religion," which he said comprised five basic features: the existence of a supreme being; the requirement to worship this supreme being; worship being best manifested by personal virtue; the need for repentance when we fall from these standards; and being rewarded or punished in afterlife on the basis of the above points. The boldest overview of deist thought was John TOLAND'S *Christianity Not Mysterious* (1696), which combined a blistering attack on the corruption of the churches and the bibliolatry of the Puritans with an attempted reconciliation of reason and religion. He also compared Christianity with Islam (see ISLAM, UNBELIEF WITHIN) and paganism, as if all three were of equal spiritual standing. Strictly speaking, Toland was a pantheist (see PANTHEISM AND UNBELIEF), which is the belief that when one speaks of God and the universe, one is speaking of the same thing. Another important deist was Lord SHAFTESBURY, who in his *Characteristics* (1711) gave a more Platonist rendering of deism, which concentrated on the moral imperative for belief in a supreme being. His works were translated into French by Denis DIDEROT. Deism was expressed poetically by Alexander Pope in his *Essay on Man* (1733–34) and *Universal Prayer* (1738).

Deism reached its apogee with the publication in 1730 by Matthew TINDAL of *Christianity as Old as Creation*, a work that attracted 150 replies. Tindal extended the critique of scriptures by arguing that such texts, being human creations, are full of errors and inconsistencies and serve only to deflect our thoughts from the proper constitution of the universe. Anthony COLLINS, another influential thinker of the time, is usually considered a deist, but some recent scholarship has argued he should be thought of as an atheist. Other important deists include VOLTAIRE and, more problematically, Jean-Jacques ROUSSEAU, notwithstanding their significant differences of approach in most other respects. And in Germany, the closest approximation of deism can be found in Immanuel KANT's work *Religion within the Limits of Reason Alone* (1792–94). Here Kant argued that the limits of religion are set not by doctrine or scripture but by our own conscience and praxis.

A significant element of deism was its commitment to the idea of natural religion. This was most frequently explained in terms of the existence of a natural religious response to the world. This is not manifested in orthodoxy or doctrine, but in the evidence of our senses. Where we find common moral decencies, so the argument goes, there we find the natural religion inherent in us all. Though not normally considered a deist, David HUME articulated a form of this in his *Dialogues*, where he outlined the beliefs he thought were ubiquitous in human beings. The Hume scholar J. C. A. Gaskin has called Hume's philosophy of religion an "attenuated deism."

The more radical deists argued that religious orthodoxies and dogmas, far from encapsulating the core truth claims of any religion, are later corruptions from the simple purity that underlies true religion. They are superstitions and prejudices given an academic gloss. This was argued forcefully by Voltaire. Though describing himself as a theist, Voltaire was one of deism's better-known publicists.

Perhaps the most energetic and influential voice belonged to Thomas PAINE, whose *The Age of Reason* (1794–95) brought deist ideas to a wider audience than ever before. Paine wrote *The Age of Reason* with the specific intention of countering what he saw as harmful and incorrect atheism. But alongside this was a blistering attack on the corruption of the churches and the perversion of what he saw as the inherently simple and deist message of the Bible. The immorality of many Bible passages, the primitive notions of society that other passages assumed, and the anthropomorphic nature of still other passages all denoted human authorship, Paine argued. And in a brilliant volte-face of the conventional pejorative, Paine recast *infidelity* not as unorthodoxy, but as being untrue to oneself. In this way, it is the "infidel"

who explains away the immoralities, absurdities, and contradictions of the Bible so as to retain belief in divine authorship, Paine argued. The true act of religion consists of discarding these all-too-human additions to allow freer access to the divine essence being forgotten.

The writings of Thomas Paine struck a nerve that went far beyond the polite disputes over the merits of deism. Shaftesbury, Collins, Tindal, and Thomas CHUBB had made many of the same points earlier in the century, but Paine's combination of these with radical politics and a critique of privilege was too much for the authorities. His influence also serves as a warning about the frequently made claim that deism was too patrician to gain widespread support. It is not that this claim is untrue, but there is a further element to it that is not usually observed. Most deists assumed their views were too sophisticated for the common people, who could be expected to prefer the anthropocentrism and emotionalism of revealed religion. But many of Paine's readers took to heart his condemnation of clerical corruption and bibliolatry and rejected *all* religion, even the deism Paine recommended. It seems the authorities were right to be worried by Paine's effect on "the vulgar."

Deism was seen by the established churches as a significant threat long before Paine. The first major attempt at a refutation came from Bishop Stillingfleet in 1677 in his *Letter to a Deist*. Indeed, Stillingfleet's letter marks something of a turning point in the history of Christianity, in that it was the first occasion when an established Christian authority figure was required to treat a rival theory seriously and not simply respond with physical coercion. From the middle of the eighteenth century, deism began to attract some powerful attacks from orthodox Christians. One of the most important was Joseph Butler's *Analogy of Religion* (1736), which argued that deism did not in fact break free from many of the philosophical problems said to trouble revealed religion so much. More interesting is that some of the most influential critiques of deism were from people who otherwise can be counted as deists. Rousseau spoke more positively about the emotions than any other deist, and Voltaire's classic satire *Candide* (1759) lampooned the sanguine confidence to which deism is susceptible with respect to the universe. Just as significant was Hume's posthumous work *Dialogues concerning Natural Religion* (1779), which fatally undermined any claim to the existence of a god, however conceived. And Percy Bysshe SHELLEY's essay *A Refutation of Deism* (1814) perceptively argued that deism was incapable of performing its task of providing a tenable refuge between Christianity and atheism. The problem that deism never effectively solved, and which Shelley understood, was its inability to demonstrate why the various shreds of religion it retained were any more intellectually sustainable than the doctrines that deists were happy to reject. This has been an ongoing problem for liberal religion to this day.

The true impact of deism is not to be found in the intellectual arena, but in politics. The deist denunciations of the corruption of clerical rule contributed to the secularization of politics. Nowhere was this more apparent than in the United States, where most of the Founding Fathers, including the first four presidents, subscribed to variations of deistic thinking. Susan Jacoby has outlined the general characteristics of the ideas of the Founding Fathers such as skepticism of the more rigid sects of the day; the conviction that if God exists, he created human rationality as the supreme instrument for understanding the world; and faith as an item of individual conscience rather than public duty. The Founding Fathers' deism was at the radical end of the spectrum, and was generally dismissive of the central tenets of Christian orthodoxy.

George Washington made no religious declaration on his deathbed (see DEATHBED CLAIMS CONCERNING UNBELIEVERS) and did not call for a clergyman to attend to his mortal demise. In true deistic fashion, Washington scorned most doctrinal contests. When petitioned by army chaplains not to appoint to their ranks a Universalist (see UNIVERSALISM TO 1961) who denied the existence of hell, he instead approved the appointment. He also oversaw a treaty with the Muslims of North Africa that declared that "the Government of the United States of America is not in any sense founded on the Christian religion" (see TRIPOLI, TREATY OF). This treaty was ratified during the presidency of his successor, John Adams.

Thomas JEFFERSON, the third president of the United States, expressed his deist principles in what has become known as *The Jefferson Bible*, which stripped Jesus of supernatural additions and presented him as a man of simple, unassuming wisdom. Jefferson was adamant that the United States should not repeat the mistakes of Europe in binding religion to the state. Echoing John LOCKE, Jefferson said that religion "is a matter which lies solely between man and his God."

James MADISON, the fourth president of the United States, was the least conventionally religious of them all, as when he declared that "[r]eligious bondage shackles and debilitates the mind and unfits it for every noble enterprise." One of the rare occasions when Madison used his veto was against a bill incorporating a church in the District of Columbia, on the grounds it infringed the separation of church and state. The separation of church and state is a logical consequence of deism and constitutes its most lasting and positive legacy.

In the first half of the nineteenth century, deism was overtaken among the uneducated by evangelical revivals, which pandered to the popular demand for transcendental consolations. Among the radical poor, the transition was toward atheism, led by Charles BRADLAUGH in Britain, and toward ANTICLERICALISM in France. In the United States, Robert Green INGERSOLL led people in the direction of AGNOSTICISM. However, deist ideas have remained influential among religious progressives, Unitarians, and religious humanists, have

contributed in important ways to the ongoing division in contemporary Western religiosity between its liberal and evangelical wings.

BILL COOKE

DEMOGRAPHY OF UNBELIEF. Until the twentieth century all peoples were highly religious: supernatural belief was nearly universal and pervaded daily life. As late as 1900, AGNOSTICISM and absolute ATHEISM may have been held by only a few million persons, mainly intellectuals. Following the unprecedented growth in global communications and travel in the wake of the Industrial Revolution, many Western Christians presumed that their faith, then embraced by a third of the planet's population, would finally sweep the world in the twentieth century. This expectation inspired the evangelical Watchword movement. For their part, at the dawn of the twentieth century many nontheists thought the age of science would soon herald the end of mass faith. This expectation became known as the secularization hypothesis.

Which of these opposing visions has proven more accurate? The answer lies in a body of large-scale international surveys that recently sampled rates of belief and unbelief worldwide. During the 1990s, two massive studies, the International Social Survey Program—Religion I and II, measured religiosity in seventeen and thirty-three nations, respectively. The 2002 Pew Global Attitudes Project asked respondents in forty-four nations to rank religion's importance in their lives. The 2004 BBC/ICM survey of ten nations sought opinions on a number of issues bearing on religion. The results of these studies generally agree with polls conducted in single nations by Gallup and similar organizations. Another resource, the evangelical-authored *World Christian Encyclopedia*, tabulates national census data on religion, though faith communities' official membership statistics are sometimes contradicted by surveys designed to capture actual opinions among church members.

The twentieth century can be seen as a grand culture war, a vast, historically unique societal experiment in which agnostics, absolute atheists, and other nonreligious ballooned to about one billion, a sixth of the world's population. Driven largely by conversion of believers, this vast expansion in unbelief—a multi-hundredfold upsurge in absolute numbers, and a fiftyfold increase in percentage of population in one long life span—far outstrips the growth of any major faith in the twentieth century, and probably in history.

Current Situation. Believers in the supernatural belong to some ten thousand significant sects, most aligned within ten major organized religions. Christianity's percentage of the population has remained stagnant overall, at about one in three. Christians are divided among some thirty-four thousand denominations, one of which—Roman Catholicism—claims almost half of all Christians. Most demographic losses among Christians represent conversions to nontheism rather than to any of the other major religions. Among the ten major religions, only Islam has seen major relative growth, moving from about 12 percent of the global population in 1900 to nearly 20 percent today, largely due to population growth rather than conversion. The third-largest faith, Hinduism, claims about a seventh of the global population. Traditional animists, New Agers, and various pagans make up about a sixth of the world's people. In alarmed reaction to the fast growth of secularization, Abrahamic and Hindu fundamentalists mounted a resurgence in recent decades.

In general, rising levels of education and income correspond to higher rates of religious skepticism. For example, despite anomalously high religious belief in the United States (see below), most American scientists are nontheists; the degree of skepticism is highest among the most distinguished researchers. This pattern repeats at the level of nations: in most second and third world countries, rates of belief remain high and relatively little changed from the past. In these nations 80 to nearly 100 percent of survey respondents report remaining absolute believers and rate religion as very important in their lives. Even so, secularism has made gains. Among Latin American respondents, up to a third describe religion as only somewhat important. Fully a third of Turks are only somewhat religious, proof that a Muslim nation can experience significant secularization. Most interesting among the second world examples is South Korea, where only a quarter of respondents identify as strongly religious and a third report little interest, although few report none. Forty percent of South Korean respondents claimed to be agnostics and atheists.

Theism suffered severe losses under Communism. Contrary to Christian claims of a great post–Cold War revival, the percentage that reported considering religion very important remains in the mere teens in Russia, eastern Germany, Bulgaria, and the Czech Republic. Across this region half to three-quarters of respondents report limited or no interest in religion. In Russia some polls suggest high rates of religious interest and report that absolute belief in theism has doubled, but theists still constitute only a quarter of respondents and church attendance is low. A third of Russian respondents still identify as agnostics or absolute atheists. Meanwhile in eastern Germany, even after reunification fully half of respondents continue to express no interest in religion and profess to be agnostics and atheists. This is the highest reported incidence of unbelief in any democratic region. Still higher rates of disbelief may exist in China, which probably has the largest absolute number of nontheists, and in North Korea (though tempered by a bizarre superstitious aura surrounding the latter's fanatical leadership). In Vietnam just a quarter of the sample claim strong interest in religion, half report low or nonexistent interest. In Islamic Uzbekistan, religious interest remains high among just a third of respondents; the same is true even in Poland, despite the cachet of Catholicism's role in helping to topple Communism.

Crisis in the West. Most striking is the crisis faced by organized religion in the west. During the last half of the twentieth century, all but one of the nineteen major prosperous developed democracies (the Western European nations, Canada, Australia, New Zealand, and Japan) experienced dramatic declines in religious belief and practice. Japan qualifies as among the most skeptical of first world democracies, with just 4 percent of respondents reporting "absolute" belief in God and fully a third self-identifying as agnostics and atheists. More than nine in ten Japanese respondents claim at most limited interest in religion; more than one in five report none whatever. In addition, rates of religious practice are low. No other democracy has so large a skeptical population in absolute terms. France exhibits even lower rates of religiosity, with a full third of respondents reporting no interest in religion, and four of ten identifying as agnostic or atheistic; the percentage reporting absolute belief in a creator is in the teens. Scandinavia, too, is a bastion of secularism, with absolute believers ranking in the teens, agnostics and atheists comprising a quarter to a third of respondents, and rates of religious practice at very low levels. Western Europe's Catholic nations are more theistic, yet even among Italians only a quarter report strong involvement in religion, while a third report little or none. Indeed half or more of Italians, Spaniards, and Irish hold no absolute belief in God. Taken as a bloc, only about one-quarter of the inhabitants of the secularized developed democracies describe themselves as absolute believers; an equal number report agnosticism or absolute atheism. In all of these countries, sizable majorities accept human descent from animals. In general, European Christianity is today generally liberal, with biblical literalists and "born-agains" comprising marginalized minorities.

It is difficult to overstate the dire condition of organized religion in the secularized democracies (that is, all of them except the United States). In none does a majority of the populace report ardent belief in a divine Christ. Meanwhile atheists are openly elected to high office and in some cases control state churches; believers in such evangelical staples as the Rapture are thought to be daft. Churches that lack state support are experiencing financial crises to the point that many churches are being converted to nonreligious uses or are renting space to commercial enterprises. So powerful is this secularizing tide that a commission of the Church of England has proposed dropping ill-attended Sabbath services and concluded that the advent of modern lifestyles "coincides with the demise of Christendom." No lesser authority than Pope John Paul II labeled Scotland "heathen." So beleaguered is European Christianity that second and third world churches are dispatching missionaries back to Europe. No significant grassroots revival appears to be in prospect in any of the secularized developed democracies. Instead, overall trends in faith point downward; for example, the number of nontheists in France has nearly doubled over the last quarter century. Although alternative modes of spirituality, including evangelicalism, Buddhism, and the New Age movement, have replaced mainstream Christian observance for some, they are by no means popular enough to offset Christianity's broad decay, especially as increasingly large numbers abandon any interest whatever in the supernatural. Likewise, though many report belief in varied paranormal claims, their level of interest is usually superficial and idle. All in all, nontheism has won the culture war in Europe, and has done so remarkably quietly and with little effort or cost.

The American Exception. The culture war still rages in the United States; alone among first world democracies, this nation displays primitive rates of religiosity otherwise seen only in the second and third worlds. Nearly two-thirds of Americans absolutely believe in God and consider religion important in their lives; nine in ten are favorable to the existence of a higher power. Not only is the United States the only nation to combine material prosperity with high levels of faith, American Christianity is exceptionally conservative by Western standards. Four in ten US respondents self-identify as born-again, about a third claim to believe that the Bible is literally true, and almost half deny human evolution. End-time novels are best-sellers and religious-themed films are blockbusters, while the media celebrates a mythical reconciliation of science and faith.

This has not always been the American norm. Many of the nation's revered founders were non-Christian deists, skeptics of a divine Christ who probably could not be elected today. Church membership has risen fairly

steadily, climbing from less than one in five in revolutionary times to greater than three in five in the 1990s. In the latter third of the twentieth century, fundamentalism gained at the expense of less conservative Christian denominations. A Gallup analysis of multiple indicators concluded that US religiosity rose in the 1990s, reversing a long but modest decline during the 1950s and 1960s. Meanwhile, more than a third of Americans distrust unbelievers; 70 percent consider them unsuitable mates.

Yet US believers have a number of reasons for concern. Differing surveys place agnostics and atheists at 3 to 10 percent of the US population, making skeptics more numerous than American Jews or Mormons. American tolerance for unbelievers is growing. Lifestyles are increasingly secularized and liberalized: Sundays have largely become homogenized with the rest of the week, civil marriages are rising at the expense of religious ceremonies, and once-shocking "alternative" lifestyles and entertainment have become at least widely tolerated and frequently highly popular. Only a few percent of Americans live strict Bible-based lifestyles, and divorce rates remain high even among the born-again. Absolute God belief among Americans is already somewhat lower than typical in the third world—by inference, lower than it was in the American past. The percentage of those who absolutely believe in God, claim to be born-again, or accept literal descent from Adam and Eve has not risen for decades. A series of Gallup polls measured a consistent halving of claims of belief in the literal truth of the Bible, from nearly two-thirds in the 1960s to half that today. The most intriguing evidence comes from a growing body of surveys that consistently report declining rates of Bible reading, prayer, and church membership and attendance. Remarkably, Protestanism is quickly dropping from a significant majority down toward minority status, and Christianity as a whole is in proportional decline, from nearly 90 percent to about 75 percent. The surveys further indicate that the unchurched doubled during the 1990s, now comprising a quarter of the population; over the same period those who express no religious preference also doubled, in this case to a sixth of the total, having started from just a few percent a half century ago. Detatchment from religioius indoctrination leaves people further inclined toward disbelief, so the churches face a retention crisis. Also, most nonreligious persons are men, and most children pick up their religious beliefs from their fathers. That Southern Baptists are baptizing members at the same rate they did half a century ago when the population was half as large illustrates the faith-based recruitment crisis. In the 1940s and 1950s between 1 and 2 percent of Gallup respondents said they did not believe in God, and up to 98 percent did. In two 2005 Gallup surveys, combined agnostics and atheists were more than 5 and 9 percent of the samples. There is no question that nontheism, including explicit atheism and agnosticism, is growing in America at the expense of faith, despite the strenuous work of the world's wealthiest religious industry.

Although high rates of religiosity are found over much of the globe, they are specific to third and second world nations and the aberrant United States. Among the remaining developed democracies, secularism is increasingly the standard. If not for influxes of characteristically religious second and third world immigrants, all of the developed democracies, including the United States, would be undergoing greater secularization.

Geographic Distribution of Religiosity. Geographically, devout Christianity is nearly extinct in its Middle Eastern home and has been largely abandoned in its historical European bastion; in the northern temperate zone, it is a strong majority phenomenon only in the United States. Christianity remains robust in much of Latin America, but is making major gains only in third world Africa, where it must compete with local animist beliefs. Two continents, Europe and Australia, can be considered wholly de-Christianized and secularized. Meanwhile, Islam continues to span the tropical Old World from the Atlantic to the Indian Oceans; mass Hinduism remains limited to the Indian subcontinent.

Demographics and the Secularization Hypothesis. Although modernity has by no means annihilated supernaturalism, for the first time religion has been dealt major blows, especially in advanced nations, partially fulfilling the secularist hypothesis and greatly disappointing evangelicals. Refuted is the widely debated chapter in Stark and Finke's *Acts of Faith* titled "Secularization, R. I. P.," in which the two pioneering sociologists of religion derisively deny Western secularization, arguing that faith is competitively superior to its alternative. Also contradicted is the widely held view that most people are strongly genetically, psychologically, or spiritually predisposed toward supernatural beliefs. Quite the contrary, religious opinion stands exposed by the data as brittle and readily subject to abandonment. The demographics of unbelief verify the argument that ardent mass faith requires evangelical promulgation by a conservative religious propaganda industry, consistently fading in the face of secularized liberal religion. In contrast, mass secularization is so potent that it occurs by spontaneous individual conversion even in the face of large-scale proselytizing and despite the absence of any comparably extensive—or expensive—secularist "missionary" movement.

Put simply, encouraging the inherently rational disbelief in supernatural deities is many times more cost effective than is promoting belief in what cannot be shown to exist. Were nontheism as evangelical and well organized as religion, then faith would be much worse off than it already is.

The Foundation of Belief. The factors behind the secular revolution's great potency are numerous and complicated, but one causal factor is clearly critical above others. Rather than being based upon unquestioning faith as is often supposed, the belief of most reli-

gious individuals actually rests upon the notion that the universe and humanity must have been created by a greater intelligence. Until the early 1800s, science was seen as verifying natural theology, making denial of a creator difficult. Modern advances in geology, paleontology, cosmology, and evolutionary biology have largely eliminated the need for a creator in order to account for the state of the world. Deprived of its aura of physical necessity, supernatural belief can be recognized as mere unsubstantiated opinion and large numbers of people will simply abandon it. The better educated a person is in modern science, the more likely one is to make this rational decision (see DARWINISM).

The close negative correlation between the acceptance of human descent from animals and the existence of a creator in the developed democracies verifies the close inverse relationship between these factors. For instance, the Japanese report the strongest acceptance of evolution *and* the weakest belief in a creator; Americans display the opposite pattern. There is no documented case in which a prosperous democracy's population is both well-versed in evolutionary science and high in theistic belief and practice, or vice versa—and it is unlikely that any exists. Not well understood is whether acceptance of evolution leads to loss in faith, or the reverse, or—as seems most likely—that the two work together in a feedback system. The importance of advancing science in undermining faith cannot be overstated. Without it, the other contributing factors would be irrelevant.

Some of these other factors themselves depend upon science and technology. For example, the dramatic social changes of the industrial age have driven secularization. Two centuries ago, most people lived lives not much different from those of their ancient ancestors, with juvenile mortality rates of 50 percent, short adult life spans, and, by modern standards, almost ubiquitous poverty. Today, particularly in the first world, vast numbers of people travel the world almost at will, live in relative comfort and opulence, and enjoy abundant food and advanced medical care. Childhood death is rare and people regularly live into their seventies or eighties. Birth control and safe abortion allow sex to occur outside of sanctified marriage without the complication of pregnancy. The masses enjoy unprecedented access to a previously unimaginable variety of entertainment and information media. As the Church of England commission has acknowledged, living like pampered and protected demigods has undoubtedly emboldened millions to discard their beliefs in archaic myths.

The postwar collapse of religion in Europe's secular developed democracies has been associated with dramatic rises in both prosperity and education. Even Ireland threw off centuries of Catholic domination simultaneously with a technology-driven economic boom.

Historical Factors Influencing American Exceptionalism. While the collapse of ardent supernaturalism in virtually all prosperous democracies is readily explained, its survival—so far—in the United States is more puzzling. Historical patterns may play a role. Even after its Christianization, much of Europe, Scandinavia in particular, may not have been as devout as previously supposed. Disastrous events such as the Black Death, the Crusades, and extended religious wars combined with the impact of the Renaissance and Enlightenment to weaken faith further. Another possible factor may have been the steady export of religious zealots to North America, which in turn might explain why the young United States was markedly more theistic than Europe. The strongly theistic Scots-Irish who have greatly influenced southern and midwestern culture may be especially important. Stark and Finke support the hypothesis that separation of church and state created a religious free market in which American churches and clerics had to compete for adherents, in marked contrast to a Europe dominated by state churches whose clerics felt little need to work at retaining communicants. But this hypothesis does little to explain the thorough secularization of Australia and New Zealand, where relations between church and state resembled those in the United States. Thorough secularization has also occurred in democracies in which state and church were sundered long ago, such as Canada, in which religion was disestablished in the mid-1800s.

Historical Factors Influencing European Secularism. Vatican and clerical corruption, ranging from the "Irish Gulag" of juvenile slave laundry facilities to long-term ties with organized crime, has contributed to the collapse of European Catholicism. Likewise Catholic corruption may encourage declining piety in Mexico and other Latin American countries. Looking back, the shock of World War I severely damaged the concept of divine-right monarchy and encouraged the first major decline in European religion. The economic collapse of the 1930s, followed by the catastrophes of World War II and the Holocaust, delivered further blows to a Christianity that had signally failed to provide either the moral guidance or the divine intervention that might have been hopes to keep the historical stronghold of Christianity from descending into horrific chaos. Meanwhile atheism gained favor, in part because skeptics were conspicuous among opponents of fascism.

More recently, the continued failings of faith have continued to discourage belief in democracies more attuned to the international situation than America. For example, the most Christian African nations are strife-torn Rwanda and the Congo, where 80 to 95 percent are ardent believers. Violent Christian terrorist military organizations such as Zambia's Lumpa Church and Uganda's Lord's Resistance Army are committing mass atrocities of extreme brutality. When Baptist lay preacher Charles Taylor stepped down from his blood-drenched rule of Liberia, he cited God at length.

The Impact of World War II. The effect of World

War II on religious belief was most direct in Japan. In what may be history's single most effective blow against any faith, following the cataclysm an apologetic emperor admitted that he was not divine, instantly creating a nation of skeptics. Also affected by one person was post–World War I Turkey, were the antireligious Atatürk initiated a wave of secularism.

The American experience with the two world wars was quite different: they served as economic boosters, raising the country's global power and status while leaving it relatively unscathed, evidence to many of divine favor. Conservative America widely perceived the subsequent Cold War as an epic struggle between Godless communism and God-fearing democracy, an attitude that has now been transplanted more or less intact into rhetoric of a struggle between Christian righteousness and virulent Islam.

US Political and Religious Conservatism: A Vicious Cycle. The traditional historical, cultural, and political conservatism of the United States buttressed the popularity of conservative religions, which tended to exhibit the high levels of ardor needed to perpetuate their mythology. In turn, religious conservatism encouraged cultural-political conservatism in a classic feedback system. In particular, the common failure of US public and private school systems properly to teach evolutionary science is driven by the conservative religious community—nearly four in ten science teachers favor teaching creationism—which then benefits from the antievolutionism that favors conservative Christianity. It is no accident that the most conservative prosperous democracy is the most religious and vice versa, the one depending greatly on the other.

It is correspondingly ironic that the bulk of anti-Darwinist religious conservatives so ardently support free-market capitalism, which is strongly socially Darwinistic. High economic disparity results in higher US rates of poverty and maleducation than in Europe, perhaps encouraging more zealous faith (but see below). The fact that the more secular prosperous democracies enjoy lower rates of murder, incarceration, juvenile and adult mortality, STD infection, juvenile pregnancy, and abortion than in the United States may reduce their peoples' perceived need for the comfort of a benign deity. Contrary to the American conceit that the faith-based nation stands as a "shining city on a hill" to an increasingly skeptical world, the deep societal dysfunction of the sole prosperous Christian nation helps inspire growing skepticism in the rest of the West, aborting the very revival many Americans desire.

What Does the Future Hold? From the believer's perspective, then, the future of faith appears grim. S. Bruce observes that if the current trends continue, Christianity in England may soon be too small to be self-sustaining, in which case major denominations could go essentially extinct early in this century. With popular theism practically dead in Scandinavia and Japan and showing no signs of revival in any other prosperous democracy, the United States is the last great Western hope of Christianity. But as D. G. Barrett et al. reluctantly acknowledge, the quickly rising number of the unchurched and those with no religion suggest that the United States is belatedly secularizing toward the Western norm. In fact, the level of nonreligiosity that Barrett et al. predicted for the year 2025 appears already to have been reached.

The options available to the defenders of faith are limited because most entail undesirable consequences. The current reactionary campaign to governmentalize faith by extending public funding to religious organizations in the United States risks assisting secularization in the way state churches arguably have done elsewhere. Although social conservatives have been successful in blaming liberalism for the materialistic, sex-focused, hedonistic mass culture that undermines faith-based lifestyles, the same conservative Christians lionize the corporate-driven social Darwinism that is by far the most powerful agent in defining culture away from traditional values. Evolutionary theory enjoys overwhelming scientific support, being a major contributor to the science and technology that remain central to the US economy and its place in the world. Evangelicals have little prospect of persuading more Americans to accept pseudoscientific creationism than already do so. Many liberal theists hold that faith can thrive in the face of widespread acceptance of evolutionary theory, but this view appears naive. J. Judis and R. Texeira predict a US sociopolitical liberalization that should encourage further declines in religiosity; the rapid growth of the unchurched and the nonreligious suggests that this process too is already under way.

Can Christianity compensate for an American decline by recruiting elsewhere in the world? Major Christian inroads are unlikely in formerly Communist Europe, in China, India, and the Islamic world, or among nontheists. The only rich sources of converts to Christianity are pagans and animists in the third and second worlds, particularly in Africa. Catholicism is poised to become a predominantly third world faith; meanwhile, if other Christians hoped that the low-grade war between political Islam and the secular/Christian West would spark a religious revival, they have few successes to point to. As for Islam, though it will continue to gain in numbers through population growth, the chronically poor economic performance of most Islamic nations will probably render it largely impotent. There is no reason to expect Hinduism to make major gains outside the Indian subcontinent. Nor are New Age or other alternative beliefs likely to sweep the globe.

Conclusion. The nineteenth-century expectation that advancing science and rationality would vanquish organized religion has not been disconfirmed after all. Unbelievers, particularly in the United States, may feel exasperation that religion has not collapsed more quickly and thoroughly, but the message of the demographic data is

clear: it is believers in the supernatural, not skeptics, who have the most to fear in the twenty-first century.

GREGORY S. PAUL

DENMARK, UNBELIEF IN. In 1999 Denmark had a population of 5.3 million and its official religion was Evangelical Lutheran. As of 1995 the religious affiliation of the population was distributed as follows: Evangelical Lutheran, 87 percent; other Christian, 1.7 percent; Muslim, 1.5 percent; and other/nonreligious, 9.8 percent (see DEMOGRAPHY OF UNBELIEF).

According to the *World Christian Encyclopedia*, the percentage of secularists (atheists and nonreligious) in Denmark was 6.6 percent in 1995, up sharply from 3.5 percent in 1980 and 0.2 percent in 1900. According to the same source, Sweden is the most secularized nation among Scandinavian countries, with 29.4 percent secularists, followed by Finland with 6.7 percent and then by Denmark with 6.6 percent. Norway trails with 2.4 percent.

A 1983 survey placed Denmark once more in the middle among Scandinavian countries on the question whether citizens believe in God. Only 52 percent of Swedes answered yes (35 percent no, 14 percent don't know), among Danes 58 percent said yes (27 percent no, 15 percent don't know), while in Norway 70 percent answered yes (23 percent no, and 7 percent don't know).

The first Dane to identify publicly as an atheist was probably Frederik Henrik Hennings Dreier. Dreier is best known as the first socialist in Denmark, but atheism was more important for him. This is expressed clearly in his *Aandetroen og den frie Tænkning* (Belief in Spirits and FREETHOUGHT, 1852). Dreier published a number of propaganda pamphlets in favor of socialism. As a medical student Dreier was well informed about the results of contemporary natural science, which strongly influenced him. Before Charles DARWIN, Dreier advocated a doctrine of evolution based on Lamarck. He died by suicide before his twenty-sixth birthday.

After Dreier's death, Georg Morris Cohen BRANDES praised his talents. Brandes was a writer and a leading critic and historian of literature. Influenced by Ludwig FEUERBACH, David Friedrich STRAUSS, and John Stuart MILL, Brandes introduced Friedrich NIETZSCHE to Scandinavia. In lectures at the University of Copenhagen he defended freethought and the theory of evolution (see EVOLUTION AND UNBELIEF). He attacked Christian ideology until the end of his life. Because of his atheism, he had to endure many years of delay before he was appointed a full professor at the University of Copenhagen.

Other early Danish atheists include the authors Jens Peter Jacobsen and Johannes V. Jensen. Jacobsen ini-

tially studied botany; he was an admirer of Darwin and translated his publications. In 1872 Jacobsen published the short story "Mogens," which attracted attention because of its distinctive style and psychology. In 1880 Jacobsen published his novel *Niels Lyhne*, which describes an atheist, dreamer, and romantic who cannot bear the heavy strain of real life. Even better known than Jacobsen is Johannes V. Jensen, one of the most gifted Danish authors of the twentieth century, who in 1944 won the Nobel Prize in Literature.

One of the philosophically most sophisticated Danish atheists of the twentieth century was Jørgen Jørgensen, professor of philosophy at Copenhagen between 1926 and 1964. Jørgensen contributed to studies in logic, psychology, and the scientific method. His basic views were close to those of members of the Vienna Circle with which he was associated (see SCHLICK, MORITZ, AND THE VIENNA CIRCLE). He is best known for his 1951 book *The Development of Logical Empiricism*.

As to organized unbelief in Denmark, the Humanistisk Forbund (Humanist Society) was established in 1960. It was quite active until about 1975, after which its level of activity was sharply reduced. At the end of the 1980s it changed its name to Humanistisk Debat (Humanist Debate), but no rise in activity resulted. In 1987 the society had about seven hundred members; by 2004 membership had fallen to about one hundred and the level of activity remained quite low.

In 2002 a new organization, the Dansk Ateistisk Selskab (Danish Atheistic Society), was established. As of early 2004, it had about forty members.

FINNGEIR HIORTH

DESCARTES, RENÉ (1596–1650), French mathematician and philosopher. René Descartes was a widely influential French philosopher who wrote on a broad range of other subjects in the sciences, including mathematics, astronomy, theories of motion, and human physiology. He spent most of his productive life in the liberal Netherlands, eschewing illiberal Catholic France. His most famous philosophical work, *Meditations on First Philosophy* (1641), sets out his philosophical method. In 1644 he published *Principles of Philosophy*, in which he linked his philosophical position to the sciences dealing with theories of matter, the universe, the earth, chemistry, and even the nature of sensations. Much of his philosophy was devoted to establishing an independent realm for the sciences and putting them on sure foundations of knowledge.

Descartes was not a philosophical skeptic; rather, he pushed SKEPTICISM to its limits hoping to show that it is a self-defeating doctrine. One aspect of Descartes's philosophical method (insofar as one can speak of this) is to subject all our ordinary beliefs and philosophical doctrines to radical and thoroughgoing doubt, and if they are open to doubt, to suspend both belief and disbelief in them. Only those doctrines that can survive such a radical critique were to be accepted as a firm basis for all other knowledge. By Descartes's time the growth of scientific knowledge had overturned what had previously been claimed to be knowledge (such as that the earth was stationary); so science is one source of doubt about received belief. But there are other sources of doubt. As had long been recognized, sensory belief can be open to error about how the world is (thus straight or bent sticks viewed in water appear bent). And on occasion it is difficult to tell whether something we remember really occurred or arose in a dream. Also, those who have lost limbs often think they can feel the presence of the limb. This last case illustrates Descartes's extreme form of doubt about the existence of the external world and even each person's material body. He imagines an evil genius who gives each of us impressions as if there were external objects like rocks and chairs, and impressions as if we have a hand, a leg, or a complete material body—but there are no such external objects or human body.

Descartes is one of the first to argue the logical possibility of the world being quite other than the way we experience it—including the possibility that, contrary to what we commonly believe, there is no external world of bodies at all. Finally he envisages the logical possibility of doubt in mathematics, say, $2 + 3 = 5$. All of these radical doubts are raised in the *First* and *Second Meditations*. According to Descartes's method, if these claims are open to the least doubt, then we can accept none as certain knowledge. As a method it certainly seems quite corrosive of common belief, the extent of its corrosiveness being a matter of philosophical debate bequeathed to us by Descartes's very program.

Is there anything that is immune from all doubt? Here we come to one of the famous moments in philosophy with Descartes's claim that there is: *Cogito, ergo Sum* ("I think, therefore I am"). How is this to be understood? By "cogito" (which we can render, perhaps misleadingly, as "I think"), Descartes means any mental activity of doubting, perceiving, affirming, denying, willing, feeling, and so on. From the proposition "I think" (so understood) Descartes wishes to prove "I exist." In his various writings Descartes gives us two ways of understanding how this is done. The first is that Descartes's "cogito" is an argument: the conclusion "I exist" is meant to follow from the premise "I think" (note the first

person character of the argument). One issue here is whether the premise "I think" is something that can be open to doubt; if so, then the conclusion cannot be certain. Another is whether the argument is valid, and whether we can be certain of it. On a second view we are invited to consider the logical impossibility of the proposition "I think but I do not exist." On either interpretation the intention is to show that radical skepticism fails in the case of "the cogito."

Just how radical is Cartesian doubt at this point? One matter that seems not to be open to doubt is the very meanings of the words that Descartes uses in "the cogito" and in other contexts. Another matter is whether we can be sure of the contents of our own minds, such as our knowledge of the mental operations we perform, given the various kinds of thing that fall under the broad notion of "cogito," or "think."

Next Descartes asks the question "What am I?" and answers "I am a thinking thing." I am not essentially a thing with a material body; this is only contingently so. What is essential to each of us is that not only do we have the property of thinking but also that we are a thing, a substance, that thinks. Here critics find that Descartes has assumed too much in claiming thing-hood for our essential selves. At best Descartes can only conclude from "the cogito" that thinking is going on, not that our essence is such that we are nonmaterial substances. This goes well beyond what his premises permit.

In the *Third Meditation* Descartes sets out to prove that God exists. So far the strategy of doubt allows that we may form ideas in our minds, but not that these ideas are about anything external to us. Thus we may form the idea of a mountain, hand, or unicorn; but there is nothing in these ideas that guarantee their existence or nonexistence. The exception for Descartes is the idea of God. The proof turns on the special feature of the very idea of God such that, once the idea is grasped, then the idea cannot be about a thing that does not exist. God, it is claimed, is a being whose essence is that it possesses all perfections; but not to exist is to lack a perfection; so, from the mere idea of the essence of God it follows that God must exist and cannot not exist. God is the unique case of a thing whose essence involves existence. Descartes's argument is a version of the Ontological Argument for the existence of God originally advanced by Saint Anselm in the eleventh century but rejected by Aquinas (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). For various philosophical reasons, the argument has recently been subject to much critical examination, but has failed the most rigorous attempts at formulation.

Granted the above, the core premises of Descartes's attempt to refute skepticism and to put all knowledge on a firm footing are now in place. How can we show that there is an external world and that our perceptions are a true representation of it (i.e., that the very green we experience of leaves is a feature of the real world and not something we "project" on to it)? If God is perfect, then it will not be in his nature to deceive us as to how the world is, like the envisaged evil genius. So, in general, our ideas of the world are about something that exists; in other words, our perceptions of greenness and leafiness are genuinely of an external object, the leaf, which has the property of being green. If the underpinning of God is removed, then we have no such guarantee in Descartes's philosophical system. In this respect Descartes bequeathed to those who accept his starting point but reject any role for God the notorious problem of the existence of the external world, that our impressions and ideas do really correspond to how the world is, and that the external world is not radically "other" (e.g., lacks color). Descartes also bequeathed to us the problem of how two distinct substances, the mind (a thinking thing) and the physical matter of which our bodies and brains are composed, are related to one another (see COGNITIVE SCIENCE AND UNBELIEF). This is a crucial unsolved problem in any theory of the material basis of the mental at the heart of all psychology and of human understanding.

DETERMINISM. Determinism is the view that all events without exception are effects, or, a little more carefully, that every event is fully caused by its antecedent conditions or causal circumstances. The conditions or circumstances too are effects of prior sufficient causes, and so on. There are two sets of questions attending determinism. The first has to do with the proper characterization of determinism, and whether or not the thesis is true. The second concerns the implications of determinism for morality, religion, punishment, psychology, and other such things that seem to depend on or to presuppose the possibility of free choice or action. We will consider both sets of questions more or less together in what follows. They are not easy to keep separate.

Getting the thesis of determinism into clear view, putting flesh on the bare definition above, is not easy either. Determinism is sometimes explained by pointing to predictability. Marcus Pierre Simon de LAPLACE, for example, maintains that if a powerful enough intellect

knew all the facts about the location and motion of every particle in the universe, and knew too the laws of nature and a little mathematics, then it could in principle predict the location and motion of every particle in the universe at any time in the future. It is a compelling thought, but not much help in clarifying the thesis of determinism—talk of predictability seems to depend on or presuppose the thesis rather than explain it.

Some try to cash the thesis out in terms of current scientific theory, and certainly Sir Isaac Newton's achievements led many to determinism. The clockwork picture of the universe, with all matter in motion in space obeying a set of causal laws, leads easily to the view that every event stands in a nomothetic (law-based) relation to certain others preceding it in the chain. Recently, interpretations of quantum theory and the uncertainty principle have persuaded some thinkers that determinism must be false. However, it is not obvious that micro-level events, about which quantum theory has something to say, have effects on macro-level events, about which the theory is largely silent and where determinism seems to matter. The things at the level of everyday observation seem bound up by causal laws, whether or not this is so for the particles of which they are composed. It is also true that freedom is not the same thing as indeterminism, uncertainty, or chance. Philosophers, anyway, tend to take the long view, noting that scientific theories come and go. Tying the truth or an understanding of determinism to our current scientific conception of the universe—some might unkindly say our best guess—seems to many a little short-sighted.

Philosophical Views of Determinism. What matters to us are not particles and quanta but beliefs, desires, hopes, and choices—and this point can be made without begging any questions concerning the metaphysics of things like beliefs and desires. Even if one is unwilling to embrace a thoroughgoing materialism about the mind (see MATERIALISM, PHILOSOPHICAL), it is at least a going proposition that mental events, whatever they are, stand in apparently causal relations to states of the brain. Brain states, it almost goes without saying, are as physical as anything (see COGNITIVE SCIENCE AND UNBELIEF). Even a dualist can be troubled by determinism.

On most readings of the truth of determinism, the upshot is that human freedom is at best problematic. If every event is an effect of prior causes and, say, your choosing to look up *determinism* in this book is an event, then your choosing appears as causal as anything which might happen on a billiard table. It might have felt, on the inside, that you looked up the term on a whim—or even for a good reason—but rewind the universe as far back into the past as you like and run it all forwards again, and causal forces will conspire to plant that whim or reason—even the feeling of your freedom in so choosing—in your head and move your hand toward the bookshelf as certainly as a billiard ball follows a precise trajectory when struck at a certain angle. The point can be pressed further by thinking not of searching for a definition, but of acts we condemn as morally wrong or acts we praise as heroic. Is there room at all for free will in, as William James puts it, "the iron block universe"? Philosophers have settled into two camps in response to this question.

Incompatibilism. Incompatibilists maintain that if determinism is true, there can be no freedom. Some, notably René DESCARTES, go on to deny the thesis of determinism outright, arguing instead for some doctrine of origination, an uncaused or self-caused act of will underlying free choice. Whether origination comes to much is uncertain. To wrench the will from the causal web entirely might result in freedom, but what help is an uncaused or random will? There might be other, empirical worries rooted in the study of human behavior and psychology for thinking that Descartes has to be wrong in characterizing the will as utterly undetermined. Other incompatibilists, so-called hard determinists, accept determinism and deny the existence of human freedom outright.

Compatibilism. Compatibilists such as Thomas HOBBES and John Stuart MILL take it that freedom and determinism are compatible, arguing for a view of freedom understood in terms of voluntary or uncompelled action, not origination. A person in prison or forced into a course of action at gunpoint is not free, but individuals not so compelled might be. Freedom, on this view, is not a matter of uncaused or undetermined action, but of voluntary action. The causal antecedents of free human actions are, as some put it, internal to the agent, consisting in his or her hopes, desires, and general character, as opposed to causal factors outside the agent, such as handcuffs, hypnotists, or prison walls. It is easy to feel a little shortchanged by compatibilism, as causal antecedents internal to an agent are still causal antecedents. Such an agent's action, though voluntary, is still determined.

Beyond Compatibilsm and Incompatibilism. Recently, Ted Honderich has argued that compatibilism and incompatibilism are both false, as each supposes that we have just one conception of freedom when in fact we have two. One conception involves origination and voluntary action; the other involves only voluntary action. The upshot, for Honderich, has to do with attitudes, the responses we give to the truth of determinism. On his view some positive or sustaining attitudes toward our life hopes, moral responsibilities, and so on, really are possible, once the two conceptions of freedom are recognized and thought through.

Arguments for Determinism. Most arguments for versions of determinism depend on the claim that the thesis of determinism is just part of the warp and weft of human thinking. It is only on the assumption that every event has a cause that we can come to an understanding of the physical universe. While David HUME argues that causal necessity is not, strictly speaking, in the world, he nevertheless concludes that seeing events as caused is

part of the human factory specification. For Hume, thinking causally is not just the only way to understand the empirical world, it is something we cannot help, a natural custom or habit of mind. Immanuel KANT takes the so-called principle of universal causation as a fundamental category of the understanding, a part of the condition of the experience of an empirical world of objects. Without thinking causally, he argues, we could not have the experience we actually have. Seeing the world in terms of cause and effect is the only way to understand any object of knowledge. For both thinkers, determinism is not something we could give up; the question of determinism is not an open one.

Arguments for Free Will. No less forceful intuitions accompany the thinking in favor of free will. The world we experience includes ourselves, and from the inside we do have the experience of freedom. It seems to us that there are moments of choice, instances in which it is up to us to take one action as opposed to another. Determinism might not be something we can give up with respect to an understanding of objects, but it is something we can scarcely take seriously with respect to an understanding of ourselves. We have just as much difficulty trying to understand an uncaused car accident as we have in genuinely accepting that our inner experience of freedom is an illusion. Even the hardest of hard determinists does not simply wait to see what he or she chooses for dinner.

Although Kant argues that determinism is a precondition of an understanding of the empirical world, he maintains that freedom is no less a precondition of practical action. There is a distinction for Kant between thinking about objects and thinking about action, between theoretical as against practical reasoning. We have no choice but to think deterministically if we want to know something about the world, but when we *act* we cannot help but think of ourselves as free. Kant's line, it seems to many, underlines rather than resolves the difficulty.

Religious Controversies. Philosophical controversies concerning determinism are matched by those in theology, though the emphasis is clearly different. In Christian and other theologies, God is characterized as all-knowing, all-powerful, and all-good. Determinism can seem to follow quickly from these attributes. Reflection on the problem of evil (see EVIL, PROBLEM OF) and divine punishment and reward can tug in the opposite direction.

If God knows everything, this must include future facts, and the choices one has yet to make are among those facts. Presumably, God knows the choices we will make before we make them, and this suggests that our choices are not really choices at all. Either human beings are not free and God knows what we will do before we do it, or humans have a measure of freedom, compromising God's knowledge. If God's all-embracing knowledge is something the theist is not willing to dispense with, then human freedom has to give. There are obvious questions concerning the coherence of divine reward and punishment, heaven and hell, if it turns out that no one really chooses to seek or avoid salvation or sin.

Saint Augustine, and later Aquinas, argue that there is a distinction between knowing what will happen and causing what will happen. God knows what we are going to do because we are going to do it; our doing it is not caused by his knowing. Both thinkers maintain that worries about determinism and God's knowledge depend on temporal categories that do not actually apply to God. God's eternity, a kind of existence outside of time, makes it possible for him to observe all events at once—or, better, independently of time. There is no real sense in which God knows about our choices before we choose them, as the very notion of "before" is not truly applicable to God's knowledge.

Similar motivations for determinism arise in connection with the consideration of God's omnipotence. If human beings really are free, then there is a clear sense in which humans might confound God's plans, might do something God did not intend. Worse, for Martin Luther and John Calvin, the thought that freely chosen human action could, in a sense, nudge a person toward salvation seems to restrict God's power intolerably. By acting in a certain way, it would seem, a person could force God's hand—that is, *make* God react appropriately by opening wide the pearly gates. For some religious thinkers, one could be saved from sin not by human choice, but only by being chosen by God. Again, if human freedom is limited in this way, no sense can be made of divine reward and punishment.

God's goodness, too, suggests a kind of determinism. The notion that a good creator could create only a good world, fixed on a settled path, was first scouted by the ancient Greeks. The Stoics (see STOICISM) contended that nature was both divine and cyclical, consisting in eternally repeating cycles of life and cataclysmic conflagration. The Stoics' famous steadfast indifference to the vagaries of life is partially explained by their view that whatever might happen in fact happens for the best, for the good aims of the universe itself. The view has echoes in Gottfried Wilhelm von LEIBNIZ, who argues that the goodness of God implies that this world is the only world God could have created, the best of all possible worlds.

The question of human freedom also arises in controversies concerning the problem of evil, which might pull the theist away from determinism. The problem of evil, roughly, is the claim that the following four propositions are incompatible, that is to say, they cannot all be true together: God is omniscient, God is omnipotent, God is omnibenevolent, and evil exists. As the last is undeniable, one of the other three must be false, which amounts to the claim that God as traditionally conceived does not exist.

In response, some theists distinguish between natural evil and human or moral evil. The former are "acts of

God," natural disasters like earthquakes and hurricanes. The latter is the evil that men do: war, murder, theft, and so on. Natural evil is then explained away with talk of soul building. The idea is that virtue requires a struggle against hardship, and natural evil is a kind of necessary test or midwife of the virtues. In any case, God is not responsible for human evil, it is argued, as this is the result of freely chosen human action. The gift of free will is itself good, it is claimed, and if we squander it on evil actions, the fault is our own.

The free will defense, as it is called, is found wanting by some thinkers, particularly following reflection on God's attributes. If God is all-knowing, it is argued, he would have known beforehand the disastrous consequences of creating human beings with the capacity to choose evil. Knowing this, and equipping us with free will anyway, God seems ultimately responsible for the evil we choose. If God is all-powerful, why did he not design us so as to freely choose the good? There are replies to these questions, and replies to those replies.

Nearby Conceptions and the Depth of the Problem. The general thesis of determinism pursued here is not the only conception in the neighborhood. Logical determinism, first noticed by the ancient Greeks but still under consideration today, begins with the innocent claim that every statement is either true or false. Propositions about future human decisions or courses of action are statements, and they too must be either true or false. Logical determinism settles the future as clearly as other determinisms do, but without talk of causation.

Doctrines of fatalism and predestination can also be distinguished from the general thesis of determinism. Fatalism is the view that no matter what one does, one's future or fate is settled. This implies that there is no point in planning, deliberating, or preparing for the future. The "idle argument," again first formulated by the Greeks, has it that if one is ill, there is no point in calling a doctor. If one is going to recover (or not), one will recover (or not) regardless of what the doctor or anyone else does. A determinist, though, is committed to the view that all events are effects, not that some events are fated to happen regardless of the preceding causal path. Talk of predestination or destiny implies a supernatural cause in the chain, either setting the lot in motion for a general aim, or fixing an individual's future for some particular end. Determinism as understood in most contemporary thinking has it that all causes are natural, not supernatural, and carries with it no commitment to the view that the causal sequence has some general aim or end.

Reflection on the long pedigree of determinism and nearby conceptions can lead one to the view that the question of human freedom is an unusually deep one. Even before philosophy got under way, humans had suspicions deterministic in flavor, and those suspicions have proved remarkably resilient. Perhaps the earliest suspicions resulted from the difficulties attending a difficult life, the experience of trying and failing regardless. Some contemporary considerations of determinism retain something of this defeatism, a worry that what we do can make no difference, that the most human of concerns are based on an illusion, that our thoughts are not really our own. The ancient worries are still with us, because what is at issue is what matters most.

Controversies attending determinism, both philosophical and religious, exhibit a pattern that is suggestive of the depth of the problem too. Both philosophers and theologians have bumped into a set of conflicting intuitions. Both are drawn toward determinism in an effort to understand what each takes to be the fundamental nature of reality, as considered apart from human concerns. For the philosopher, this is a world of objects in causal relations, and for the theist, this is a creator or a created order. Both, too, are dragged away from determinism when the focus narrows to human interests. For the philosopher, there is the experience of freedom, and for the theist, there are the choices underpinning salvation and sin. The conflicting intuitions cannot both be right, but it is not clear that either set can be rejected.

DEVELOPING WORLD, UNBELIEF IN. In one sense ATHEISM and HUMANISM are ancient, and in another they are modern. The ideals of atheism, humanism, and the idea of the oneness of humanity date from time immemorial, and actually have their roots in the developing countries. Many of these countries are the cradles of ancient cultures and civilizations, with rich traditions of thought and belief that enthrall people even today. The lands of Asia, Africa, and South America were the birth-

places of the great religions, but also of philosophical thought that questioned the existence of god, promoting RATIONALISM, SKEPTICISM, and atheism. The Samkhya philosophy was an atheist strand of ancient Indian philosophical thought (see INDIAN MATERIALISM, ANCIENT). This broad-based mixture of the quest for truth, compassion for fellow humans, and a scientific temper produced many influential persons like the Buddha (see BUDDHISM, UNBELIEF WITHIN), the Mahavira, and Confucius (see CONFUCIANISM), who taught basic human values even as they reflected philosophical radicalism and skepticism.

Unlike in the West, where one religion tends to dominate any given country or region, in the East different philosophical, social, and religious systems coexist. The ancient, medieval, and modern streams of thought flow together, overlapping one another in a continuum.

In ancient India, the CARVAKAS and the Lokayatas kept the banner of atheism high, questioning the practices of religion and making clear the futility of belief in god and religion. Buddha's agnosticism, Mahavira's magnanimity, and Confucius's thoroughness continue to inspire many even as they do today. In the Middle Ages, while Europe groped, people in what we now call the developing countries already followed well-worn paths of tolerance, contentment, and compassion.

The twelfth-century revolutionary Basaveswara fought against the caste system and encouraged intercaste marriages. Brahmanayudu, a fourteenth-century minister to the king of Palnadu, advocated intercaste dining and socializing. The fifteenth-century poet Kabir opposed idolatry and preached Hindu-Muslim unity. The sixteenth-century Mughal emperor Akbar championed *Dine-elahi*, or religious toleration. The late seventeenth- and early eighteenth-century philosopher, thinker, and campaigner Vemana condemned social evils and preached a universal outlook.

Europe's rediscovery of classical civilization led to its Renaissance, and eventually to the maritime powers' subjugation of colonies across what we now call the developing world.

The Colonial Era. The colonial era exposed the contradictions of Asian and African societies. Though their national liberation struggles in the twentieth century were meant to throw off the imperialism of the colonial powers, they were nonetheless strongly influenced by liberal Western traditions. Almost without exception the leaders of anticolonial independence movements were admirers of the modern rationalist and humanist traditions of the West. The ideals of the American and French revolutions inspired these leaders and through them, their countries' middle classes, kindling in them nationalism on the one hand and rationalism and humanism on the other. Western ideas of law, justice, equality, and fair play reinforced their own ideas for social reform in their respective countries. Hand in hand with resistance against the colonial powers, the secularization of these societies began.

Direct personal contact between the colonial and the developing countries brought a fresh breeze of ideas. Charles BRADLAUGH, the first atheist in the British Parliament, participated in the third conference of the Indian National Congress in Bombay and championed the cause of the Indians in Parliament. Western liberal and humanist ideals also inspired the anticolonial struggles in lands subjugated by the French, the Dutch (see MULTATULI), and others.

Nationalism and Humanism. Nationalism and humanism had a liberating influence, eroding the constricting shackles of religion and communalism as they did tribal loyalties. Even though some of the new national leaders might have believed personally in God and religion, they felt their newly independent states must have nothing to do with religion. When in the Constituent Assembly of India an amendment was moved to invoke the name of "God Almighty" in the preamble to India's constitution, it was defeated by an overwhelming vote. The secular stance taken in Turkey under Ata Turk Mustafa Kamal (who later took the name Atatürk) had a far-reaching impact on people. By the early to middle twentieth century, modernization and secularism were viewed as inseparable.

In many developing countries, law is an important instrument of social change. Not only does the preamble to India's constitution provide that India is a "SOVEREIGN, SOCIALIST, SECULAR DEMOCRATIC REPUBLIC" (capitalized in the original), Article 51A(h) of the India's Constitution states that it is the "FUNDAMENTAL DUTY" of every citizen "to promote scientific temper, spirit of inquiry, reform and humanism." Thus in India abortion, family planning, and many other progressive measures have constitutional as well as legislative sanction. Progressive legislation has resulted from continuous efforts by rationalists, humanists, atheists, and other progressive-minded people (see INDIA, UNBELIEF IN). Thus unbelief in the developing countries was not merely a system of philosophical thought, but also a ground for sociocultural action.

For the developing world's champions of unbelief, direct opposition to superstitions, blind beliefs, and obscurantism was integral to their programs, as were efforts to lessen social and economic inequalities, poverty, ill health, ignorance, and illiteracy. Secularism was not merely a cherished goal, but a practical necessity in view of religious strife and tribal feuds, including (in India) intercaste feuds. For Indian activists the eradication of untouchability and social reform in order to move toward a casteless society was central to their work.

The secularization of this period gave important social breathing space to unbelievers. Bradlaugh's case had a salutary effect on the developing countries. For example, the constitution of India provides for affirmation as a recognized alternative to swearing an oath in the name of

one's god. India was formed without a state religion; freedom of expression and belief enjoy constitutional guarantee. The Special Marriage Act facilitates registration of marriages without reference to caste and religion.

Across the developing world, nationalist movements initially brought with them democratic socialist ideals, the rule of law, regular elections, and other liberalizing influences. With them came a scientific temper, a rational outlook, sex education, and other educational reforms.

Secular Nationalist Movements. The nationalist movements were inclusive, reflecting secularism and FREETHOUGHT. Nationalist leaders like India's Jawaharlal Nehru strongly emphasized science and the scientific temper. Mahatma Gandhi viewed religion as a personal matter which should be confined to the personal domain. "I do not want to bring my religion into the market place," he said. State education was liberal and secular minded. When Bangladesh emerged as a breakaway Muslim state, secularists viewed this as evidence that far from being a unifying bond that drew a country together, religion was inherently a centrifugal and divisive force.

Demands for gender equality in India continue gaining ground. One-third of the seats in every elected legislative body, from *Panchayat* (village) governments to parliament, are reserved for women. The active participation of female politicians has helped to prepare the ground for social justice and to establish a more liberal atmosphere.

Across India, regional governments encourage intercaste, casteless, and religionless marriages and protect them if need be. In some areas couples entering into such marriages qualify for monetary and employment incentives. At times police stations are employed as neutral venues for such weddings.

The influence of humane laws, social reforms, equality before the law, the sense of social justice, scientific discoveries, a rationalist approach, and liberal and progressive thinking have brought deep and abiding change. After a period during which the momentum of secularization seemed to have diminished in Indian society, the poor performance of fanatical religious parties in recent elections reveals that unbelief continues as an important force in the life of that nation.

Social Reform. South Asia has benefited from a long parade of reformers who uphold the banner of unbelief. Prominent names from the nineteenth and twentieth centuries include Raja Ram Mohan Roy, Eswar Chandra Vidya Sagar, Kesab Chandra Sen, Mahatma Phule, Maharshi Karve, Kandukuri Veeresalingam, Mahatma Gandhi, Dr. B. R. Ambedkar, PERIYAR E. V. Ramaswami, M. N. ROY, GORA, Abraham T. KOVOOR, V. M. TARKUNDE, Prof. H. Narasimhaiah, Dr. Indumati PARIKH, and Mrs. Saraswathi Gora. Because of them and others, unbelief continues growing, while orthodoxy faces unrelenting challenge.

Atheist, rationalist, humanist, and secularist organizations are playing significant roles in developing countries. For instance, in India, the Andh Shraddha Nirmulan Samithi, the Atheist Centre, the Atheist Society, the Buddhivadi Samaj, the Dravidar Kazhgam, the Humanist Union, the Indian Rationalist Association, the Radical Humanist Association, the Taksheel Society, the Indian Secular Society, the Kerala Yukthivadi Sangham, the Indian Committee for the Scientific Investigation of Claims of the Paranormal, and many other organizations are striving for social change along secular lines. In Muslim countries persecution is strong, and hence people like Dr. Taslima NASRIN (Bangladesh) and Dr. Younus Shaikh (Pakistan) have been forced to seek asylum outside their countries.

In most countries across the region there is no social security program, and workers and peasants are largely unorganized. Progressive-minded unbelievers take up secular social work to aid women and children and those below the poverty line. Unbelievers are active in areas of social work including human rights, environmental awareness, and human resource development, as well as natural disaster relief.

A Constructive Approach. Unbelief does not confine itself merely to criticizing the traditional epics and religious beliefs, but is adopting a constructive agenda as well, building alternate structures in education and social service. By their work they seek to demonstrate by example that to do good, and to be good, the props of an imaginary god and religion are not necessary. Their message is that morality is a social necessity, and helping fellow humans is the responsibility of all. This social work expands beyond the frontiers of charity, laying groundwork for the positive empowerment of the people it serves. The result has been a growing democratic and egalitarian consciousness, especially among the impoverished, illiterate, and tribal groups. Education and awareness are the keys to social progress.

Resistance to religion also empowers the disadvantaged, because—especially in India—God and religion have become a multibillion-dollar industry whose profits are rooted in exploitation of the poor and gullible. Unbelieving activists have called attention to scandals in the temples and religious trusts, criticized the lavish lifestyles of many so-called *babas* and gurus, and focused scrutiny on their growing commercial ventures. Unmistakably, the god industry thrives with the connivance of politicians and administrators. Temples, churches, and mosques have begun establishing medical, engineering, and other colleges—even minting their own money while they enjoy tax exemptions based on their religious or minority status. Corruption is rampant. Unbelieving activists are working to catalyze a growing demand that religious institutions be taxed on par with commercial ventures—which is what so many of them now are.

Fighting Disparity in Resources. Unbelief in the developing world is contributing to liberalize and secularize the society. It strengthens secular ethics; strives for uniformity in civil codes; promotes gender equality;

inculcates humanistic and secular values; upholds science and the scientific outlook; organizes science exhibitions; exposes superstitions and the so-called miracles of exploitative god-men; and advocates alternatives to religious ways of life. The effort is silent but salient, exerting powerful social effects despite a paucity of resources.

While unbelieving organizations struggle to survive, religious organizations enjoy generous direct and indirect state support, including concessions, patronage, and resources for their educational institutions. Despite this disparity, unbelief is growing in a remarkable manner. Increasing numbers of people are moving away from religion. As understanding of science grows, confidence engenders disenchantment, and they come to see religion as superfluous. Religion is waging psychological counterwarfare, trying to maintain its stranglehold. But in many parts of the developing world, the march toward a postreligious society has begun.

A "Movement" Approach. In order to strengthen unbelief in the developing countries, education and awareness building require unswerving and persistent efforts. It is necessary to present atheism as an alternate way of life in which the human being, not a god, enjoys the preeminent position. Doing this will probably require that humanism, rationalism, atheism, and freethought should focus more on developing as movements than on developing membership organizations. The membership-organization model is suited to the West, where nonreligious organizations can organize themselves to some extent in parallel with the religious institutions that occupy in turn specified and delimited roles in society. Across Asia and Africa, religion functions as a part of culture. It is not organized as one institution among others, it rather is a way of life and pervades all of life. In that situation, humanism and atheism can best make strides as movements that address all aspects of life and provide a powerful counterexample to the life of religion. Hence, secular social work, the agitation for social reform, and rendering timely help to the needy are of utmost importance.

In the developing countries unbelief cannot be promoted in the abstract—it must be concrete. In the West the minimum needs of individuals may be guaranteed by the state through social security and other measures, but in the developing countries it falls to volunteers to render assistance to people. Unbelievers must be seen taking leadership roles in this work—and they are. Initiatives embodying this perspective included the late Indumati PARIKH's "Stree Hitakarini" work in reproductive health and hygiene among the slum dwellers of Bombay. Malladi Subbamma renders assistance to women in distress; Lavanam and Hemalata Lavanam work among the *jogins* (temple prostitutes) and criminals; M. V. Tarkunde strove for civil liberties; Dr. Samaram leads an untiring crusade for sex education and for dispelling superstitions. There are many others.

Distinctive Qualities of Unbelief. Today humanism, rationalism, freethought, atheism, and secularism are spreading in both villages and urban areas. The movement is growing horizontally rather than vertically. In the Indian context, it is not only the intelligentsia but also the common people who are enjoying the warmth of nonreligious ideas and supporting the movement. Each person may take small steps, but the cumulative effect is vast. Inspired by nonreligious ideals, an ordinary person may discontinue religious obervances. He or she may marry out of caste or religion; or a couple may champion the secular method of marriage. Similarly, while taking an oath, either in parliament or in a court of law, or at the time of assuming a public office, atheists, humanists, and rationalists may choose to affirm rather than swear an oath of office, which in India is enshrined in the constitution. These apparently small steps by ordinary citizens bring qualitative changes in their outlook, and distinguish them from the rest of the society as humanists and atheists. It is through such practices that humanism and atheism win credence and strength in the developing countries.

Unbelief in developing countries, in particular in India, is taken seriously by the people who champion it. It tends to be a way of life for them rather than merely an intellectual discourse. In child-rearing, secular moorings are visible; for example, they give their children secular rather than traditional names. One measure of the movement's impact is that today, even religious people look at atheists and rationalists as role models and expect them to live up to secular ideals.

G. VIJAYAM

DEVIL, UNBELIEF IN THE. Monotheistic religions (Judaism, Christianity, and Islam) identify "the devil," or Satan, as the archenemy of God, and as a fallen or renegade angel who became evil by his own choice. This concept, developed gradually during two millennia, explains the presence of evil in a world overseen by a single omnipotent, benevolent deity (see EVIL, PROBLEM OF). The devil is not God's equal, but is extremely powerful. Although God could destroy him or defeat his evildoing, God prefers to allow the exercise of free will, both to the devil and to the humans whose evildoing he inspires. A world without evil would allow no possibility of merit, so our imperfect world is actually superior to one where no evil exists. Dualistic religions, which postulate an evil god almost as powerful as the good god, explain the prevalence of evil more logically, but disparage creation (the cosmos defined as the work of a god) by defining matter as intrinsically evil. The devil, a spiritual or nonmaterial being ultimately responsible for all evil, safeguards two ideas: that life in the material world is good despite tragedy and injustice, and that God himself is therefore fundamentally good.

Despite the coherence of this view, not all adherents of monotheistic religions have accepted the premise that Satan exists. Already in the time of Christ, the Sadducees, a Jewish sect, questioned the existence of spirits. According to the Acts of the Apostles, "[T]he Sadducees say that there is no resurrection, neither [is there any] angel, nor spirit" (Acts 23:8; cf. 4:1–2; Matt. 22:23; Mark 12:18; Luke 20:27). These Christian texts interpret the Sadducees' doctrine as denying the essence and novelty of Christian teaching: the existence of suprahuman spirits and the immortality of the human soul (1 Cor. 15:12–19). The story in Acts implies the Sadducees' fallacy: when Sadducee priests imprisoned Peter and others, "an angel of the Lord" appeared to release them (5:19). The Sadducees "were cut to the heart" by this escape and "took counsel to slay" the apostles (5:33).

Through much of the Middle Ages, Sadducee doctrine did not worry Christian commentators excessively; the existence and influence of the devil seemed self-evident. Questions about the reality of spirits began after 1100. The reintroduction of Aristotelian philosophy into Latin Europe in the twelfth and thirteenth centuries accelerated discussion. Scholastic philosophy discussed the existence of "separate spirits" devoid of material bodies: angels, demons, and the human soul after death. Thomas Aquinas developed an elaborate philosophical system that attempted to reconcile the "truths of faith" with the evidence of reason and the senses as expounded by ARISTOTLE, "the Philosopher" par excellence. Aquinas constructed systematic proofs of the existence of God, and also scientific descriptions of angels, devils, and the immortal human soul.

Although Aristotle's philosophy attracted Latin churchmen for its rationality and empiricism, these qualities, far from automatically demonstrating the superiority of Christian cosmology, ontology, and epistemology, sometimes threatened their credibility. The Muslim philosopher Ibn Rushd, or AVERROËS, worried Christians by contending that Aristotle had not asserted the immortality of individual human souls; Averroës and others also observed that Aristotle presumed the world was eternal—and thus not created by God. Around 1225, Caesarius of Heisterbach devoted an entire book of his *Dialogue on Miracles* to proving that demons were not imaginary.

Aquinas's system did not require Satan's existence. He admitted more than once that some Aristotelians did not accept the reality of angels and devils, and once asserted that neither Aristotle nor his disciples ever mentioned them. Aquinas countered that demonic possession and necromancy refuted Aristotelian unbelief empirically. Aquinas's reservations, expressed in shorter, specialized treatises, received less attention than his major works, which spoke more confidently of angels and devils. But his reservations were not forgotten. In 1516 and again in 1520, the Aristotelian Pietro Pomponazzi outraged theologians with systematic demonstrations that Aristotle rejected angels, demons, human immortality—and witchcraft (see WITCHCRAFT AND UNBELIEF). Not coincidentally, the Fifth Lateran Council (1513) belatedly declared human immortality an article of faith.

Already by 1460 several early witchcraft treatises had quoted Aquinas's reservations precisely, then announced their authors' discovery that witchcraft proved empirically that angels, demons, and Satan's work in the world were real. Investigating illiterate people's accusations that certain people "bewitched" others, causing disease, death, and the destruction of crops and livestock, churchmen and magistrates argued that Satan and his demons caused the damage in exchange for the witches' souls. Aquinas's angelology and demonology were invoked to explain how Satan and his demons, although immaterial by nature (and thus imperceptible to human senses), could create artificial or virtual bodies and interact corporeally with witches through rites, dances, and orgiastic sex. This verifiable physical interaction—despite depending on *artificial* demonic bodies—was elaborately analyzed as proof that demons were real. In addition to the Sadducees, early witchcraft authors cited ancient materialists or atomists such as Democritus and EPICURUS among the opponents whose unbelief in the spirit world they claimed to refute conclusively.

Its dependence on corporeality and physical interaction made witchcraft the preferred method for demonstrating the reality of spirit phenomena. From the beginning, theoretical writings on witchcraft stressed that doubting the reality of the devil and demons, angels, or human immortality was impious, and further that

doubting the reality of witchcraft led inevitably to Sadducism. This fear affected even opponents of witch-hunting. When Johann Weyer wrote a long medical treatise to demonstrate the unreality of witchcraft and protest the barbarity of torturing and executing witches, he prefaced it thus: "I totally reject the maxims of Aristotle and the Peripatetics and also of the Sadducees, all of whom contend that demons do not exist in reality" and devoted another eighty-seven pages to scientific acceptance of the devil.

Jean Bodin replied that Weyer defended witches because he was a witch. Bodin argued as if Weyer doubted the devil and Aristotle did not: "There is an enemy of the human race . . . [who] was created right at the beginning, as is affirmed in Job. And not only Holy Scripture, but all [Platonists], [Aristotelians], Stoics, and Arab thinkers agree about the existence of spirits, so that to call it into doubt (as do the atheistic Epicureans) would be to deny the principles of all Metaphysics and the existence of God, as Aristotle has shown, and the movement of the celestial bodies, which he attributes to 'Spirits' and 'Intelligences,' for the word 'spirit' signifies angels and demons."

After Bodin's time, unbelievers in witchcraft were increasingly denounced as atheists rather than as Sadducees. The poet Torquato Tasso diagnosed himself as an unwilling atheist and unbeliever; perhaps influenced by Bodin, he imagined a long dialogue with an angelic being who attempted to demonstrate the real existence of his own species, but without notable success. Only the mention of witchcraft and spirit possession came close to convincing the skeptic. Christopher Marlowe's *Dr. Faustus* (1600) implies that Faustus becomes a necromancer in a similar personal crisis.

Perhaps owing to Satan's utility as an explanation of the origin of evil, his existence was not debated as early, explicitly, or frequently as that of an angelic/demonic species and a general spirit world. Yet the devil's existence was always implicit in these general discussions. When western European intellectuals began defending the reality of witchcraft in the 1400s, they opposed the longstanding consensus of the Latin church. For at least six hundred years, the church had taught that "bewitchment" and witches' supposed nocturnal activities were illusions caused by Satan, who made simple people imagine impossible feats. Defenders of witchcraft persecution aimed their treatises at refuting the main decree (Canon *Episcopi*, ca. 900) enshrining the church's unbelief in witchcraft. By declaring that Satan worked only in the human imagination, and predominantly in dreams, this decree left no means of proving that the devil interacted with waking, sane people, and thus that he was real.

As the debate over witchcraft wore on into the seventeenth and eighteenth centuries, the existence of the devil became more problematic: one defender wrote that "it is a policy of the Devil to persuade us that there is no Devil." The reality of the devil steadily receded in synchrony with the decline of witch persecution; a related aspect was the "decline of Hell" as an article of vivid belief among Christians. Puritan divines such as Increase and Cotton Mather of Massachusetts continually equated unbelief in demons with ATHEISM, as Bodin had done; after the 1692 Salem witch trials collapsed amid skepticism and scandal, both Mathers actively sought to encounter good angels, and Increase published a treatise, *Angelographia*, defending their existence. Non-Puritan contemporaries also continued to invoke witchcraft to defend the reality of spirits; Joseph Glanvill's *Saducismus Triumphatus* is emblematic. Citing Glanvill, John Wesley, the founder of Methodism, lamented that in the rationalistic climate of the mid-eighteenth century, proofs of spiritual reality were derided and scorned; Wesley warned that "the giving up of witchcraft is, in effect, the giving up of the Bible." Doubt further accelerated in the nineteenth century. In Fyodor Dostoyevski's *Brothers Karamazov* (1880), Ivan agonizes over the unjust suffering of the innocent, loses his faith, but encounters the devil one night. Aware of hallucinating, Ivan hears Satan ask why a proof of his existence should demonstrate the existence of God.

While belief in the devil continues to wane among modern Europeans, opinion surveys in the United States around 2000 indicated that a large majority claimed to believe in the devil's physical existence. Yet American fads indicated an ongoing hunger for proof that spirits—whether good or evil—really exist and interact with people: guardian angel worship, panics over "ritual child abuse" and other forms of "Satanic subversion," along with "alien abduction syndrome" and "realistic" evangelical novels about the coming apocalypse. Such movements uneasily intuit what seventeenth-century defenders of witch persecution made explicit: If there is no proof of the devil, there is no proof of God.

WALTER STEPHENS

DEWEY, JOHN (1859–1952), American pragmatist philosopher. John Dewey was born on October 20, 1859, in Burlington, Vermont. He received his BA from the University of Vermont in 1879, and his PhD in philosophy from Johns Hopkins University in 1884. From 1884 to 1894 Dewey taught philosophy at the University of Michigan, interrupted by a year at the University of Minnesota in 1888–89. From 1894 to 1904, Dewey was professor and chair of the philosophy, psychology, and pedagogy department at the University of Chicago, and with his wife, Alice, he led his experimental Dewey School of primary education. Dewey joined the philosophy faculty of Columbia University in 1905, and he taught there until retiring in 1929. Until 1939 Dewey was active at Columbia as emeritus professor. During his final years, Dewey continued to promote liberal democratic causes and organizations, and published significant political and philosophical writings. Dewey died on June 1, 1952, in New York City. At his death, he was acclaimed as having been America's foremost philosopher and public intellectual for more than two generations.

From his early Hegelian idealism to his mature NATURALISM and humanistic ATHEISM (see also HUMANISM), Dewey's philosophy remained committed to empiricism: the supreme importance of lived human experience in all its individuality, variety, and creativity. Dewey's early philosophy argued that experience supplies sufficient evidence of an all-encompassing absolute and divine mind. This absolute idealism healed the dualisms of the strict Calvinism of Dewey's upbringing, confirming his preference for universal salvation and an identification of religious faith with moral commitment, placing Dewey within the Social Gospel movement. By around 1895, Dewey decided that absolute idealism could not guide anyone toward moral progress, because the absolute's moral perfection condemns to failure all human experience and action. Religious ideals of moral conduct must be practical, Dewey decided, offering helpful guidance for the growth of moral character.

During the twentieth century, Dewey joined religious humanists (see RELIGIOUS HUMANISM) and naturalists in viewing any actual belief in the existence of a divine power to be incompatible with naturalism and quite irrelevant for a genuinely religious life. Since neither a supernatural authority giving unquestionable commandments nor a spiritual absolute offering inscrutable perfection could guide morality (and indeed these only obstruct morality), Dewey concluded that liberal Christianity must logically proceed to atheism. Dewey's atheism was philosophically sophisticated, naturally, as he continued to recommend "natural piety" toward the sources and supports of one's life. His understanding and sympathy for religious experience developed in the context of his social psychology and pragmatic theory of knowledge. Rejecting the Cartesian notion of private mental states and isolated rationality, Dewey's evolutionary social psychology instead held that the habits of intelligence are learned by education and modified by further experience in group practices.

Social Psychology and Functionalism. Three major dimensions of Dewey's social psychology shaped his mature philosophy. They are most explicitly developed in *Human Nature and Conduct* (1922) and *Experience and Nature* (1925). First, experience is not subjectively private. Second, people's beliefs and knowledge are not subjective, either, but instead are functions of purposive behavior that have socially shared significance for group practices. Third, all knowledge arises from experience, and thought increases the meaningfulness of experience, producing knowledge. Dewey's empiricism held that the techniques of inference that increase meaning that guide knowledge production (such as logic, mathematics, and scientific methodology) themselves gradually emerge from experience.

For Dewey, both experience and knowledge are thoroughly goal directed, social in nature, and cultural in significance. Dewey's philosophy could not take either the individual's "subjective" experience or science's "objective" knowledge to be more capable of revealing reality or somehow independent of all-embracing culture. Reli-

gion in Dewey's philosophy is similarly treated as an evolving social phenomenon that cannot be evaluated without considering its role in cultural development. The philosophical evaluation of any human practice must be pragmatic, according to Dewey (see PRAGMATISM).

Pragmatism. Dewey's functional psychology implies a pragmatist theory of knowledge. If all beliefs exist to serve the pursuit of practical goals (and not to match some idealized vision of "truth"), then the evaluation of beliefs is judged by finding in experiment how much they contribute to successful behavior. Older theories of knowledge assumed that meaningful mental entities can be easily identified (by the power of reflection?) and compared against the portion of reality to which they refer. Such theories must depict both mind and reality statically, implicitly presuming that an isolated internal mental entity has some magical power perfectly to select out the part or aspect of reality which it is trying to represent.

However, since 1900, scientific psychology has been dynamic, not static. No scientifically respectable psychology remains to endorse the possibility of the sort of comparison required by a correspondence theory of knowledge (leaving only skeptics and Thomists still attached to long-outdated psychologies). All that remains from medieval and Cartesian rationalism is the correspondence theory of truth, but its remaining defenders happily admit that their theory does nothing to actually assist increasing knowledge. Since pragmatism is primarily a theory of how we increase knowledge, its complaint against truth as correspondence amounts to pointing out its uselessness. In *The Quest for Certainty* (1929), Dewey explains the regrettable attractions of the notion of absolute truth and explains how modern science has replaced it. Pragmatists understand truth in accord with their theory of knowledge. Dewey's pragmatic theory of knowledge is fallibilistic, for it is possible to have knowledge now which later must be modified or replaced by new knowledge. Roughly, knowledge is scientifically justified belief. Truth is an irrelevant criterion, and therefore no Gettier-style problems arise for pragmatism because they all require scenarios in which current knowledge is compared unfavorably against some absolute truth. Dewey rarely used the term *truth* with approval, and was most comfortable instead labeling as "truths" everything currently known.

Dewey heard Charles Sanders Peirce's definition of truth as that ideal limit of communal scientific inquiry while a student at Johns Hopkins, and Dewey had no objection. The closest approach that a pragmatist can make to absolute truth is to assign such truth to propositions which are known by some inquirer, present or future, that would never be overturned if all possible inquiries were exhausted. The notion of truths (or some kinds of realities) existing forever beyond possible inquiry is not endorsed by pragmatism, although pragmatism offers no conclusive argument for their nonexistence.

Scientific Method. Pragmatism is a serious effort to understand and improve on scientific method, as the best way yet invented for increasing reliable knowledge. However, pragmatists, including Dewey, refused to assign science the unique responsibility of determining what really exists; reality, including experienceable reality, contains far more than what science could ever know about. Dewey's pragmatism and preference for science should not be interpreted as a commitment to scientific reductionism or materialism (see MATERIALISM, PHILOSOPHICAL). Dewey's naturalism thus amounts to a stern denial of supernaturalism and dualism. Scientific theories about entities and processes only instrumentally observable should be interpreted realistically, according to Dewey, although those entities postulated by science that are by definition forever inaccessible to even instrumentally aided observation should not. Dewey's pragmatism can hence be fallibly realistic about molecules and superclusters of galaxies, but not about forces of nature or subatomic particles (given the current state of scientific progress). Dewey's *Logic: The Theory of Inquiry* (1938) develops his theory of scientific method.

Unlike Peirce's narrow attention to the natural sciences, Dewey believed that scientific inquiry's fundamentally creative and experimental method could be applied to all human problems, including moral and political problems. Natural science's conclusions could not erect a new morality, but the scientific method of inquiry itself can be applied to any problematic situation in which current knowledge is unable to resolve doubt about what to do. Of course, our appreciation of our current situation is guided by a vast knowledge base, including principles that emphasize more relevant features of the situation and suggest the best course of action. Inquiry first tries to apply that knowledge base to a problem; failure indicates that further inquiry must experimentally modify the knowledge base. Dewey's *How We Think* (1933) provides his general account of the processes of learning through inquiry. In natural science, this learning eventually implies modifications to theories, while in morality or politics this implies modifications to moral or political norms.

Rejecting the Humean instrumentalist model of reasoning (see HUME, DAVID), Dewey understands the scientific method as capable of pragmatically evaluating both the means and the ends of actions in light of their further consequences; see his *Theory of Valuation* (1939). Consideration of the means necessary for an end, or of future consequences of achieving that end, is a reevaluation of that end's value and desirability. There is nothing that could be immune from such reasoned consideration, and therefore no end or good can be declared as supreme, final, or all-inclusive. The moral and political life instead requires the constant renegotiation of shifting priorities among innumerable goals, values, and norms.

Democracy. For Dewey, the scientific method applied to society is democracy. Like science, which proceeds through distributed intelligence among cooperating inquirers, democracy is the way of life in which mutually respectful citizens intelligently deliberate on their common social problems. *Democracy and Education* (1916) is Dewey's fullest statement of the essential role that scientific, moral, and civic education must play in a democracy. Dewey also sketched a theory of political democracy about the government that would best serve a democratic community. *The Public and Its Problems* (1927) and *Liberalism and Social Action* (1935) develop Dewey's theory of "publics": groups of people with common problems trying to modify social or political norms for remedies. These publics are educated in the skills of cooperative deliberation from schooling and past experience, and compete for attention from elected officials and from the whole community with the help of social scientists and other experts. Publics naturally dissolve when their problems are alleviated, and peoples' energies are redirected to other problems.

Against aristocratic theories of democracy that assign to the government and experts the responsibility for recognizing and solving social problems, Dewey expects greater citizenship skills from the masses so that they can do more than just vote periodically. Of course, if each person by oneself is expected to help with all of a country's problems, faith in democracy seems hopelessly utopian. However, Dewey explained how ordinary people can devote some measure of time, energy, and intelligence between voting to a few serious problems affecting them, and thus publics can be energized. Prominent examples include unions and civic organizations; national societies such the American Civil Liberties Union, the National Association for the Advancement of Colored People (Dewey was a cofounder of both), and the National Rifle Association; industry associations; and every sort of lobbying and special interest group imaginable. If a democracy can promote both the free formation of effective publics and the caring responsiveness from the whole body of citizens, then Dewey envisioned progress toward the ideal Great Community. Democracy is the form of community life and government which respects and peacefully promotes universal moral respect and empowers its citizens through education for the civic capacities of moral deliberation. As a regulative ideal, the notion of a Great Community helps to expose immorality and injustice and suggest remedies for transforming society.

Progressive Liberalism. Dewey departed further from traditional liberalism because he argued that people require more than John LOCKE's negative rights and liberties to be full citizens. The right to fair and safe employment (not just a right to individual property), to education in the skills of citizenship (not merely free speech), and to toleration and protection of ethnic heritage (not cultural assimilation and hegemony) are among the additional empowering rights justified in a healthy democracy. His *Ethics* (1932), written with James H. Tufts, provides a detailed theory of economic and social justice that owes much to both the liberal tradition and to utilitarianism, and especially to John Stuart MILL, although Dewey sometimes preferred the label of "social utilitarianism" since most goods are socially shared goods. Dewey was a democratic socialist, since he favored strong democratic intervention in the economic sphere to prevent injustice, but he was never a Communist since he rejected Communism's use of violence and preferred restrained capitalism to state ownership of all industry. Like many liberal progressives, Dewey instead expected strong unions and other types of effective publics to be able to peacefully negotiate for the things needed for greater social justice. For Dewey, the understanding of democracy as a moral community implies noncoercive deliberation to resolve conflicts. Dewey's demand that violence be only an absolute last resort linked him with pacifists such as Jane ADDAMS, who also demanded that governments should engage in international cooperation to actively prevent conditions provoking war. Dewey's other major concern was that wars are extremely hazardous to a democracy's civil liberties.

Dewey, like later communitarians, viewed people as deeply connected to a variety of social groups. He recommended an inclusive cultural pluralism in which people possess group membership while being free to enjoy and adopt other groups' ways. The morality that should be taught in public schools (private schooling encourages antidemocratic tendencies) consists of the civic virtues of respect for the equal dignity of all, cooperative group problem solving, and loyalty to the ideals and aims of democracy. The only intolerance innate to Dewey's democracy is the rejection of groups that claim to possess absolute moral norms and values that prevent their members from following democratic civic virtues and incapacitate them for cooperative public deliberation.

Democracy requires a somewhat flexible and experimental attitude toward even our most cherished moral norms and values, because a few may require modification during our lifetimes to permit the alleviation of serious social problems. Even Dewey's own specific formulations of the civic virtues and basic rights are advanced in a tentative manner, and he expected them to be gradually modified in the future. The principle that seems the most absolute in Dewey's philosophy, the standard by which he undertakes moral and political criticism, is the demand that all persons must have an equal opportunity to realize their capacities and enjoy life in a manner consistent with the greater social good. However, even this principle remains flexible for Dewey, since the practical meaning of "realizing capacities" will change into the future as the possibilities of human experience expand.

Religion. Dewey eloquently expresses his high valua-

tion of religious experience (see RELIGIOUS AND MYSTICAL EXPERIENCES), after being liberated from supernaturalism, in most of his major works. Unlike fellow pragmatist William James, whose mysticism found divinely inspiring powers present at the fringes of individual consciousness, Dewey required religious and moral experience and belief to have only social significance. Therefore, religious experience could only consist of one's communion with others in expressions of commitment (through group practices) to social values. What is Dewey's pragmatist alternative to a supernatural god? As early as 1892, Dewey concluded that a liberal, nonsupernatural Christianity was best for America. This liberal Christianity was still Christianity because the American community still holds Jesus to be an exemplary moral figure of love. For Dewey, the example of mutual love and respect for all people is simultaneously Christian and democratic, and democracy's progress is Christian progress. In the 1890s Dewey also asserted that Jesus offered no specific rules, doctrines, or creeds, and thus he left no church. The preferred alternative to churches and their religions of fixed truth is the "continual revelation" of new truths about how to fulfill the ideal of love which will arise from the process of democracy itself.

After these early pronouncements, Dewey was largely silent on the historical figure of Jesus (see JESUS, HISTORICITY OF), but he did remain hostile toward churches. In *A Common Faith* (1934), Dewey's distinction between *religions* (the churches' doctrines) and *the religious* (those liberated into pluralistic and progressive democracy) reemphasized his claim that the democratic experience is also religious experience. The religious are those who have escaped supernaturalism and sectarian creeds, and can join in the aesthetic appreciation of the pursuit of democracy. In *Art as Experience* (1934) Dewey found paradigms of aesthetic experience in communal practices devoted to ideals. In *A Common Faith* Dewey again appeals to the coextensive aesthetic/religious experience of pursuing ideals. The democratic commitment to moral respect for all people has the quality of a religious faith, and a democratic culture, like any culture, should possess a religion as a unifying social force diffused throughout all cultural activities. Dewey concluded that democracy is the form of life in which the shared aesthetic enjoyment of the democratic community life is collectively of great value, and that this communion is a kind of highly valuable religious experience.

In *A Common Faith* the notion of natural piety again plays a role. Dewey identified the object of natural piety as the organic unity of human strivings with cooperating natural forces. A democracy should likewise encourage this natural piety, and religious devotion is thus properly oriented toward human-environment relationships as well as human-human relationships. To the surprise of many, especially Dewey's humanist colleagues, he went farther, controversially offering the label of "God" for the object of religious experience. Critics have pointed out that the name "God" at least implies a unified and purposive agency and perhaps a personality as well, signaling a retreat to older religious notions that Dewey himself rejected. Most philosophers and speculative theologians who have pursued Dewey's suggestions toward a naturalistic and humanistic religion remain quite wary of such labels as "God." However, the task remains to fully explain how the sort of intense religious devotion to ideals, still useful in any democracy, can be aroused and maintained without trespassing the boundaries set by naturalism.

JOHN R. SHOOK

DIDEROT, DENIS (1713–1784), French encyclopedist. Denis Diderot's relationship with religious thought and practice was complex and lifelong. This is because it was his habit as a writer to lay false trails in his works, often creating erroneous impressions of his ideas. It was also his custom to hide from his contemporaries some of his most original and daring writings, which remained unknown for many years. Consequently, the facts on which critics have had to base their judgments have changed substantially since his death, and the reassessment of his importance as an Enlightenment figure is still by no means complete.

Diderot was born into a devout family in Langres (Champagne), where his forebears had been cutlers for generations. He had a conventional religious education in the local Jesuit college, from which he received the ton-

sure (a step in preparation for the priesthood) in 1726. His younger brother Didier, with whom he would later quarrel violently over religion, became a priest, while a younger sister, Angélique, took the veil and died insane in a convent in 1748. His maternal uncle was a canon at the cathedral church of Langres, and if Diderot declined the opportunity to succeed him in this office, his interest in religion was still strong enough for him to enroll at the Jansenist Collège d'Harcourt in Paris in 1729. Having thus been a pupil of the two major religious sects of the time, he obtained his master's degree in 1732, the customary preliminary to preparing for the priesthood. Yet his faith (at least in the doctrines of the Catholic Church) was fast waning, and he never took this step. In the years between 1735 and 1745, his self-imposed program of studies in science, languages, and mathematics led him in quite other directions from the one he had first envisaged.

Diderot has often been assimilated into the great secular, atheistic movement of ideas that is central to the French Enlightenment, but this is to oversimplify the question. The earliest of his works to attest to his views on religion was a 1745 translation of Earl SHAFTESBURY's 1699 *Essay concerning Virtue and Merit.* This *Essai sur le mérite et la vertu* maintains that belief in God is necessary for the practice of virtue, which requires divine sanction, but that belief in Christianity is not. His independent outlook is further developed in the *Pensées philosophiques* (Philosophical Thoughts) of 1746. This short, portable book was quickly condemned as blasphemous, and always remained one of Diderot's most controversial writings. The *Pensées*, often described as atheistic, might better be thought of as an externalized dialogue on religion that Diderot conducts with himself. While he does not disguise his disillusionment with Christianity, he voices his preference for what he calls *naturalism*—a term left undefined but closely akin, it would seem, to deism. Diderot's belief in an omnipotent deity is more doubtful in *La Promenade du Sceptique* (The Skeptic's Walk), a dialogue written in 1747 but unpublished until 1830. In it Diderot casts doubt on the notion of God using the traditional weapons of the rationalist skeptic. Perhaps as a result of the death of his beloved younger sister Angélique, any lingering attachment he had to religious belief is absent from the materialistic *Lettre sur les Aveugles* (Letter on the Blind) of 1749; here, the blind mathematician Saunderson refuses to believe in God unless he can touch him. The *Lettre*, more than any of Diderot's other writings to date, finally exhausted the patience of the authorities, who jailed him for several months in 1749. This was despite the fact that he had by then become one of the editors of the great *ENCYCLOPÉDIE*, which was to occupy the next twenty or more years of his life. His imprisonment was not unduly harsh, but it marked his psyche and increased his tendency to ensure that any of his ideas that might be dangerous were not openly disseminated in print. Yet despite the *Lettre*, Diderot had not in reality abandoned all religious beliefs, though no consistent expression of his views on religion (or on many other subjects) was readily forthcoming.

On the one hand, the labyrinthine complexities of the *Encyclopédie* allowed him to express skeptical ideas obliquely. Articles whose ostensible subjects have little to do with religion as such provided cover for criticisms of the church, or the Bible, or for the discussion of doctrinal issues. Hence, "Agnus scythicus" (1751) begins as the consideration of an obscure plant, whose remarkable properties, on closer examination, turn out to be wholly imaginary. This lesson in the critical evaluation of evidence was clearly intended to apply not only to such mundane reports, but to accounts of supernatural events such as miracles as well. In "Philosophy of the Chinese" (1753), he reports a seventeenth-century emperor asking Christian missionaries why their God had kept the Chinese so long in ignorance of his existence, a question to which no clear answer is forthcoming. In these and many other articles, Diderot and his collaborators made innumerable damaging forays against the edifice of official beliefs and doctrines enjoined by the Catholic Church. Theirs was a prolonged assault: the much-persecuted *Encyclopédie* was not finished until 1772, and the (indispensable) index to it did not appear until 1780.

On the other hand, whatever impression he contrived to give the public of his own robustly skeptical attitude toward religious belief, and particularly toward Christianity, Diderot was in private a more troubled man. A document has recently been published that must be set against the mockery of the *Encyclopédie*. This is *La Prière du Sceptique* (The Skeptic's Prayer) in his own handwriting, bound into a copy of his *Pensées sur l'Interprétation de la nature* (Thoughts on the Interpretation of Nature) of 1754. It opens with these words: "I began with Nature, which they called your handiwork, and I shall finish with you, whose name on Earth is God. O God, I do not know if you exist; but my thoughts shall be as though you saw into my soul, and I shall act as though I stood before you."

Though this prayer was published in a (rather unreliable) edition of Diderot's works in 1773, the publication of the holograph manuscript confirming his authorship puts many of his other utterances on religion in a different perspective. It seems clear that, although he began as an orthodox Christian believer who may even have had a religious vocation, he subsequently vacillated considerably in his beliefs, moving between deism, materialist atheism, and skepticism as his ideas changed. Yet if he later tried to reconcile himself with the idea of God, his disenchantment with Christianity, and his mockery of the Catholic Church for its repressive hold on the human mind remained constant. Indeed, these views are expressed in two more of his "secret" writings, the novel *La Religieuse* (The Nun, 1760) and the 1772 dialogue entitled *Supplément au voyage de Bougainville* (Supplement to Bougainville's Voyage). Both of these remained unpublished until 1796, a dozen years after his death. As they show unmistakably, his hatred of tyranny in all its

forms was in later years an overriding preoccupation. In a short poem, "*Les Eleuthéromanes*" (The Zealots for Freedom, 1772), also published in 1796, he speaks of "weaving together the guts of a priest, to use as a rope for strangling kings." Diderot did not live to see the French Revolution, but he would not have been surprised at the course it took.

DAVID ADAMS

DOUGLASS, FREDERICK (1818–1895), American orator and abolitionist. One of the most courageous abolitionists and greatest orators of the nineteenth century was born Frederick Augustus Washington Bailey. After this former slave gained his freedom as an adult, he changed his last name to Douglass following the advice of an associate.

Douglass was born into slavery to Harriet Bailey on Holmes Hill Farm in Easton, Maryland. He never met his white father. His grandmother Betsey Bailey raised him on the farm; he only saw his mother on a few occasions. In August 1824, when he was only six, his grandmother was forced to give him to new owners, and the painful separation from his loved ones was etched in his memory for the rest of his life.

In 1834 Douglass worked for Edward Covey, who had a reputation as being able to break any slave's will. The harsh, deeply religious slave driver brutalized Douglass. But one day Douglass rebelled, and the two fought for nearly two hours until Covey finally gave up. The sixteen-year-old Douglass felt enormously empowered, and the experience gave him great confidence.

In 1838 Douglass escaped slavery and fled to New Bedford, Massachusetts. On September 15, 1838, he married a free black woman named Ann Murray. (By 1845 they had four children.) It was also in that year that he changed his name to Douglass.

Not long after arriving in New Bedford, Douglass subscribed to the *Liberator*, the newspaper of the American Anti-Slavery Society, headed by the man who would become his idol, William Lloyd Garrison.

During the Civil War, Douglass served as an adviser to President Abraham Lincoln. He helped persuade Lincoln to use African American troops. On January 1, 1863, the president signed the Emancipation Proclamation, which was designed to free slaves in Confederate states, permitting them to join the Union army.

Douglass served as an army recruiter throughout the United States during the war. He recruited two of his sons, Charles and Frederick, who joined the renowned 54th Massachusetts Regiment. However, Douglass was not satisfied with the mere presence of African Americans in the Union army. On August 10, 1863, Douglass met with Lincoln to voice complaints about the shoddy treatment and low pay of African American soldiers.

Douglass respected and admired "the Great Agnostic," Robert Green INGERSOLL. Once, when Douglass was denied lodging because of his race when scheduled to speak in Illinois, Ingersoll welcomed him warmly into his home. Douglass was reported to have said that Lincoln—another freethinker—and Ingersoll were the only white men in whose company "he could be without feeling he was regarded as inferior to them."

Douglass was deeply humanistic (see HUMANISM). Indeed, he believed so firmly in SECULARISM that he once offered to debate a black preacher on whether organized prayers and Bible readings should be permitted in public schools. (Douglass was vigorously opposed.)

In 1870 Douglass spoke to a group in Philadelphia and another group in New York City. Though the black clergy and others had routinely thanked God, Douglass told the audiences he would not indulge in such "hackneyed" God talk. He preferred to thank the human beings who had clearly dedicated their lives to the abolition of slavery. He would express this view for the rest of his life.

In 1889 Douglass was appointed US minister to Haiti and chargé d'affaires of Santo Domingo. He noted the poor conditions in these countries, observing that Haiti was the first Caribbean nation to be taken over by Christianity. He believed it was better to give blacks political power than to give them faith in an afterlife.

Douglass was a committed humanist activist until the end. On February 20, 1895, he defended women's rights at the National Council of Women (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF). He died later that evening, ending the life of one of the most outstanding heroes in US history.

DRAPER, JOHN WILLIAM (1811–1882), American chemist, physiologist, and historian. Unbelievers know John William Draper as creator of the so-called military metaphor of bitter struggle between science and religion (see RELIGION IN CONFLICT WITH SCIENCE). Rightly or wrongly, that view of relations between dogma and inquiry shaped much late nineteenth- and twentieth-century thinking in domains including evolution (see EVOLUTION AND UNBELIEF), cosmology, BIBLICAL CRITICISM, and sexual morality (see SEXUAL VALUES, IMPACT OF UNBELIEF ON). The writings of Draper and his successors were embraced by freethinkers and many humanists (see FREETHOUGHT; HUMANISM) as mainstream vindication for their views.

Draper was born on May 5, 1811, near Liverpool, England, the son of a Methodist minister. At the University of London he dabbled in POSITIVISM. Draper, his wife, and three sisters sailed for America in 1832; he appeared sufficiently orthodox to secure teaching appointments at Methodist colleges. In 1839 he assumed the chair in chemistry at the University of the City of New York.

Draper's religious views were conflicted. He was in some ways traditionally Methodist, in others a deist (see DEISM) who had accepted the principle of evolution well before the publication of Darwin's *Origin of Species*. Surely he had ceased to understand the Bible as divinely inspired. Draper's private life was touched by sectarian strife; he expelled from his household a sister who had converted to Catholicism.

In an ironic footnote to history, Draper addressed the British Association at Oxford on June 30, 1860, his extended remarks delaying the start of the celebrated evolution debate between Bishop Samuel Wilberforce and Thomas Henry HUXLEY. This debate emerged as a defining event of the Victorian era and likely spurred Draper's thinking on science and religion.

In an idiosyncratic *History of the Intellectual Development of Europe* (1864), Draper espoused a Comtean, positivist view of social development as bound by rigid laws (see COMTE, AUGUSTE), demonized the popes as enemies of science, and lauded Islamic civilization as friendlier toward discovery than the West. The book was well received; in 1873 Draper was approached by Edward Livingston Youmans, an American promoter of popular science books. Youmans envisioned a title by Draper on science and religion as the thirteenth volume in his successful "International Scientific Series." Pressed for time, Draper condensed large sections from his *History*, then added a preface and three concluding chapters reflecting recent events, particularly the Catholic Church's vigorous new campaign against modernity. In the Syllabus of Errors (1864) Pope Pius IX had denounced almost every fruit of science and scholarship; in 1870 the First Vatican Council had proclaimed him infallible. Draper responded with the *History of the Conflict between Religion and Science* (1874), an incendiary tract that indicted not Christianity but specifically Roman Catholicism for hobbling human progress.

Draper traced the origins of science to the fourth century BCE among Greeks stimulated by exposure to the Persian Empire. Religion's inherent incompatibility with science he dated to the fading days of the Roman Empire. A romanticized account introduced American readers to HYPATIA, a pagan woman scholar slaughtered by monks in Alexandria in 417 CE.

Draper famously observed, "A divine revelation must necessarily be intolerant of contradiction; it must repudiate all improvement in itself, and view with disdain that arising from the progressive intellectual development of man." In other words, conflict between science and religion is inevitable. His closing paragraph thundered: "As to the issue of the coming conflict, can any one doubt? . . . Faith must render an account of herself to Reason. Mysteries must give place to facts. Religion must relinquish that imperious, that domineering position which she has so long maintained against Science. There must be absolute freedom for thought. The ecclesiastic must learn to keep himself within the domain he has chosen, and cease to tyrannize over the philosopher . . . who will bear such interference no longer."

The book was spectacularly successful, both financially and in terms of its intellectual impact. It enjoyed fifty printings in the United States, twenty-one in Britain, and was translated into nine languages. The Spanish edition (1876) was placed on the Vatican's Index of Forbidden Books, setting Draper alongside such luminaries as Copernicus, Galileo GALILEI, John LOCKE, and John Stuart MILL.

Draper died on January 4, 1882, at Hastings-on-Hudson, New York. His *History of the Conflict between Religion and Science* would inspire a vigorous literature steeped in the military metaphor, most importantly Andrew Dickson WHITE's influential *History of the Warfare of Science with Theology in Christendom* (1896).

TOM FLYNN

DREISER, THEODORE (1871–1945), American writer. As one of the most controversial and successful novelists of his day, Theodore Dreiser expressed its turbulent crosscurrents in a probing if ponderous style. Throughout a long, colorful life, he never forgot his poverty-blasted beginnings in Terre Haute, Indiana, as the son of a fervently Catholic father who was a skilled but unsuccessful woolen-mill operator. His mother had been a pietistic Mennonite who converted to Catholicism at her husband's demand. Growing up in a large family that frequently had to move one step ahead of the bill collectors and ill at ease with his looks and the family's chronic desperation, young Theodore yet maintained a rather dreamy nature. After a series of odd jobs and a year at Indiana University given him by a former teacher, Dreiser became a newspaper reporter and gravitated toward writing as a livelihood.

At an early age, Dreiser began to resist his religious upbringing. Ever restless and curious, he evolved a philosophy of DETERMINISM based on Herbert SPENCER. He adopted a naturalistic literary style. "We were taught persistently," he wrote, "to shun most human experience as either dangerous or degrading or destructive. The less you knew about life the better; the more you knew about the fictional heaven and hell ditto. People walked about in a kind of sanctified daze or dream, hypnotized or self-hypnotized by an erratic and impossible theory of human conduct which had grown up heaven knows where or how, and had finally cast its amethystine spell over all America, if not over all the world."

Dreiser's first novel, *Sister Carrie* (1900), was for all practical purposes repressed by its publisher, in part on grounds of immorality. A reviewer for the *Chicago Tribune* noted, "Not once does the name of the Deity appear in the book, except as it is implied in the suggestion of profanity," but went on to say that such a book had been long awaited. Eventually the novel was republished, and Dreiser was acknowledged to be a major figure in modern American literature. Despite such success, there was persistent opposition from "antivice" religious groups; H. L. MENCKEN remained Dreiser's constant friend and a champion of free expression.

In other novels Dreiser took up the theme of the "self-made man" in American society, exploring this type's need for sexual and political power. *An American Tragedy* (1926) tells the story of Clyde Griffiths, who rises from poverty in Kansas City and goes east to work in a relative's factory. There he is involved in a rich woman's drowning, for which he is convicted and sentenced to death. The early scenes on the streets of the metropolis, where a pitiful group of Clyde's family members sings and preaches the gospel, are clearly reminiscent of Dreiser's own pietistic youth. Their "virus of Evangelism" is no real cure for the "vast skepticism and apathy of life." The success of this novel made Dreiser wealthy at last.

In 1927 he journeyed to Soviet Russia, where his books had earned large amounts of royalties in rubles. Generally sympathetic to the great Communist experiment, Dreiser retained what he felt he needed, the freedom to observe conditions for himself and to criticize weaknesses. During the Great Depression, he journeyed to Harlan County, Kentucky, to write of the suffering and repression of coal miners for the radical magazine *New Masses*.

In his later years, Dreiser continued to write and publish fiction. Just before his death in 1945, he joined the Communist Party. At his funeral in Forest Lawn Cemetery, the presiding minister seemed ill at ease, at one point taking as his text "help thou my unbelief" (Mark 9:24).

FRED WHITEHEAD

DUBOIS, WILLIAM EDWARD BURGHARDT (1868–1963), Amrican scholar and activist. Widely regarded as the most important African American scholar of the twentieth century, W. E. B. DuBois attended what was then the all-black Fisk College (now Fisk University) in Nashville, Tennessee, between 1885 and 1888. He eventually graduated from Fisk and Harvard. He then studied history, sociology, and philosophy at the University of Berlin. In 1891 he received a master's degree from Harvard. In 1894 Harvard awarded him a doctorate in philosophy.

In 1896 DuBois was the recipient of a fellowship at the University of Pennsylvania. While there, he conducted a study of blacks in Philadelphia. The result was a classic called *The Philadelphia Negro*, leading some scholars to give him the title "the Father of Social Science."

Next DuBois worked at Atlanta University, where he studied African American life and culture. Moreover, he became deeply interested in the role of Africa in world history. While in Atlanta DuBois became involved in an ongoing debate with the black conservative Booker T. Washington, who believed that blacks should put emphasis upon vocational education, self-help, and the acquisition of skills. In 1903 DuBois published another classic work, *The*

Souls of Black Folk, in opposition to Washington's conservative program. DuBois argued that blacks should agitate for their rights. Moreover, he promoted the idea of "the Talented Tenth," an elite, educated class constituting 10 percent of the black population, which he believed would lead blacks into the twentieth century.

In 1906 DuBois and a small group of black men organized the Niagara movement in an effort to agitate for freedom, justice, and equality for blacks in the United States. Allegedly denied permission by racist whites to meet in Niagara Falls, New York, the group decided to meet on the Canadian side. No women were permitted to attend, because the men believed it would be too dangerous, considering the cause they were espousing. Out of the Niagara movement grew the National Association for the Advancement of the Colored People (NAACP) in 1909. Ironically, the organization's leadership was predominantly white. However, DuBois assumed the editorship of the group's magazine, *The Crisis*, and served in that position for twenty-four years.

In 1900 DuBois was the secretary of the first Pan-African Congress in London. The goal of these international congresses was to advocate self-determination for African and Caribbean nations and colonies. The early leaders of these congresses were DuBois, George Padmore, humanist C. L. R. JAMES, and Henry Sylvester Williams—the latter three from Trinidad.

In 1919 the second Pan-African Congress was held in Paris. The delegates presented the League of Nations with resolutions demanding independence from Western domination for African and Caribbean nations.

In 1923 a congress was held in London and Lisbon. In 1927 there was a congress in Harlem. DuBois chaired this congress, and there were 208 delegates and about 5,000 people in attendance. DuBois then wanted to hold a congress in Tunis, but the French government feared the possibility of a Tunisian rebellion. They granted DuBois permission to hold the congress in Paris. It was a moot point, however; the Great Depression arrived in 1929 and derailed the plans.

The Pan-African movement put DuBois in direct competition with Marcus Garvey, the charismatic and flamboyant leader of the Universal Negro Improvement Association (UNIA). Both leaders believed in African redemption, but had major differences in style and substance. Perhaps most importantly, Garvey advocated racial separation, while DuBois was willing to work with progressive whites to advance the cause. Many scholars believe that the debate between Garvey and DuBois far exceeded that between DuBois and Washington in intensity, hostility, and vitriol. Eventually, the US government deported Garvey and the UNIA was greatly weakened, losing members and financing. Meanwhile, DuBois would go on to lead another congress in 1945, in Manchester, England.

In 1933 DuBois left the NAACP over political differences, having also reached the conclusion that it was hard to effectively agitate for black advancement within the ranks of a protest organization headed primarily by whites. He returned to Atlanta University, and in 1935 he wrote another classic work about life after the Civil War, *Black Reconstruction*. He brilliantly demonstrated that blacks played highly influential roles in rebuilding the South after the war.

In 1940 DuBois wrote *Dusk of Dawn*, in which he examined the African American quest for freedom, justice, and equality. In 1946 he wrote *The World and Africa*, a major work showing that blacks in Africa made impressive contributions to world culture and human civilization.

Throughout his illustrious career, DuBois was an anticlerical agnostic (see AGNOSTICISM). He refused to lead prayers when asked to do so. He regarded the theology of the average black church as immature, dogmatic, and highly irrational. However, he believed that black churches had many redeeming qualities, though he believed the Christianity of whites had failed miserably.

In 1961 President Kwame Nkrumah of Ghana invited DuBois to the West African nation. DuBois accepted the offer, and died there, two years later. His remains are buried at the W. E. B. DuBois Memorial Centre for Pan African Culture in Accra.

EDELMANN, JOHANN CHRISTIAN (1698–1767), German theologian and agnostic. Son of a court musician at Sachsen-Weissenfels, Johann Christian Edelmann studied at Jena from 1720 to 1724 under the moderate philosopher-theologian Johann Franz Buddeus. Like many other intellectuals of this period in Germany, Edelmann began to work as a private tutor for nobility and clergy. After an intensive religious quest he broke

with Lutheranism, influenced by the historian of HERESY Gottfried Arnold. From 1734, he followed a calling as a writer, publishing fifteen monthly pieces titled *Innocent Truths* on disputed theological questions. Settling in the liberal state of Sayn-Wittgenstein-Berleburg from 1736 to 1741, he engaged in discussions with various "pietist" and dissident circles, among them Herrnhuters and Mennonites, and read widely in European radical thought.

Fired by Baruch SPINOZA's *Tractatus Theologico-Politicus*, he published "The Revealed Face of Moses" (1740), in which he argued that the Bible is a purely human book and the teaching of Jesus contradicts the teaching of Christian churches. This publication provoked 172 published "refutations" through 1755, and was banned in most places. Edelmann himself had to flee repeatedly from Lutheran orthodox campaigns. After publishing an ironically titled "Confession of Faith" in which he averred that the use of REASON is the only true divine service, in 1746 he was forced to ask Frederick II of Prussia for protection. That protection was granted in 1749 on the condition that Edelmann henceforth keep public silence. In 1750 his books were burned by the "Imperial Book Commission." Now unable to publish, he was reduced to translating and extensively commenting on banned books for secret circulation in Masonic lodges. Moses Mendelssohn reports having met Edelmann living in Berlin, full of "fear of being recognized." Edelmann's autobiography (written 1749–1753) would only be published—and then in truncated form—in 1849.

Edelmann was the first to transmit radical Enlightenment ideas (see ENLIGHTENMENT, UNBELIEF DURING THE) in vernacular German, defying censorship. He brought about an irreversible shift toward DEISM in the German public, thus beginning the process his "freethinking" protector Frederick II had wanted to avoid: bringing enlightenment to the people.

FRIEDER OTTO WOLF

EDWARDS, PAUL (1923–2004), American philosopher and encyclopedist. A member of the editorial board of *Free Inquiry* magazine and the International Academy of Humanism, Edwards was born in Vienna, Austria. A gifted student, he was admitted to the prestigious Akademische Gymnasium. After the Nazi annexation of Austria, his family sent him to stay with friends in Scotland. He later went to Melbourne, Australia, where he studied philosophy at the University of Melbourne and was influenced by the analytic tradition that held sway there. After the war he came to Columbia University, where he completed a doctorate in philosophy. He was to spend the rest of his life in New York City, teaching at such institutions as New York University, the New School for Social Research, and Brooklyn College.

Edwards is best known for editing the monumental *Encyclopedia of Philosophy*, which originally appeared in 1967 and has never since been out of print. It remains the essential reference work for the field of philosophy. Using his editorial prerogative, Edwards made sure that there were plentiful entries on ATHEISM, materialism (see MATERIALISM, PHILOSOPHICAL), and critiques of God's existence, and he himself cowrote the long entry on his own philosophical hero, Bertrand RUSSELL. In 1959 Edwards edited a collection of Russell's previously scattered writings dealing with religion, titled *Why I Am Not a Christian and Other Essays*, which became a seminal work in the promotion of unbelief.

Those who knew Edwards will always remember his erudition and his wicked sense of humor. An admirer of VOLTAIRE and Russell for their great wit, Edwards had a special fondness for the life and works of David HUME, the man he considered to be the best exemplar of a learned individual who lived life to the fullest and who remained to the day of his death a cheerful nonbeliever.

Shortly before his own death, Edwards published a collection of essays entitled *Heidegger's Confusions* (2004), dedicated to demolishing the legacy of the man whom Edwards considered to have done the greatest damage to the field of philosophy in the twentieth century. He particularly abhorred Heidegger's confusing writings on the nature of death and his cryptic comment that "[o]nly a God can save us now." For Edwards, such an expression was beneath contempt.

Edwards also wrote a biting critique of reincarnation, *Reincarnation: A Critical Examination* (1996). The volume he coedited with Arthur Pap, *A Modern Introduction to Philosophy*, was one of the most influential

textbooks ever published in the field, and contained copious selections from such unbelievers as Paul Rée, John Stuart Mill, Clarence Darrow, Bertrand Russell, David Hume, Ernest Nagel, and A. J. Ayer, as well as Edwards's own insightful introductions and annotations. Never one to hide his own unbelief, Edwards often commented that his two main goals were to demolish the influence of Heidegger and keep alive the memory of Wilhelm Reich, the much-reviled psychoanalyst whose critiques of religion Edwards felt remained valid. Edwards's final book, *God and the Philosophers* (2007), a summation of the views of all the major Western philosophers on the subject of the deity, was published posthumously.

ELIOT, GEORGE. See **Evans, Marian.**

EMERSON, RALPH WALDO (1803–1882), American author. Though Ralph Waldo Emerson no longer commands the Olympian deference accorded to him in the nineteenth century, some of his essays, such as "Nature," "Self-Reliance," "The American Scholar," and "Divinity School Address," remain popular in American classrooms. Even in circles where his transcendentalism is deprecated, he is sometimes hailed as a prophet of democratic idealism and individual autonomy. Because he insisted that institutional precepts be subordinated to the dictates of the "inner light," he can still ruffle guardians of tradition. In his day, he antagonized the orthodox clergy by denying the authority of biblical revelation and the efficacy of the Lord's Supper.

His Transcendentalism. Emerson believed true knowledge derives from intuitive flashes that transcend reason, logic, and sensation. At the heart of reality, he descried a friendly spirit, the Over-Soul, effusing benign ministrations to all sentient beings. The Over-Soul revealed to Emerson propositions he held dear: All division is mere appearance, God is omnipresent, the moral sense is innate and universal, evil is illusory, and truth will prevail.

Critique. Numerous seers, East and West, have registered their conviction that whatever the appearances, all is well. So long as seers do not try to validate their beliefs discursively, they do not invite criticism. But when they seek to persuade the world that their beliefs harmonize with external fact, their statements are liable to the rules of evidence.

Although Emerson maintained that ultimate reality lies beyond demonstration and verbal formulation, his rhetorical deeds belied the claim. In essays and letters, he habitually sought to demonstrate as well as provoke, exhort, and cajole. In the process he raided the arsenal of polemic device. He illustrated, exemplified, analogized, defined, classified, compared, and contrasted. He drew conclusions from premises, sought premises to support conclusions, and inferred causes from effects and effects from causes. When evidence to support his beliefs was available, he clasped it. When reason served, he embraced it. When evidence and reason palled, he tossed them into the trash bin of the lowly Understanding and appealed to Intuition, a higher mode of apprehension. He then adopted the venerable mystic precept that whatever one strongly feels must be cosmic truth: "Speak your latent conviction and it shall be the universal sense."

Emerson believed in a universal language of hearts: "To believe your own thought, to believe that what is true for you in your private heart is true for all men is genius." Had he eavesdropped on the hearts of Adolf Hitler, Joseph Stalin, Pol Pot, Ted Bundy, and kindred monsters, he might have qualified his belief—or at least had his hearing checked.

"The prized reality," wrote Emerson, "the Law, is apprehended, now and then, for a serene and profound moment amidst the hubhub of cares and works which have no direct bearing on it—is then lost for months or years, and again found for an interval to be lost again. In fifty years we may have half a dozen reasonable hours." Had Emerson recurred to impartial analysis, he might have suspected the "reasonable hours" were psychological aberrations, not revelations of eternal law.

EMPIRICUS, SEXTUS (3rd century CE), Greek skeptical philosopher. Almost nothing is known about this late second- and early third-century CE physician and chron-

icler of ancient Greek SKEPTICISM. We do possess, however, his *Outlines of Pyrrhonism* (in three books) and his *Against the Mathematicians* (in eleven books). The first book of the former work sets out the basic Pyrrhonian position and way of life. It also explains the various skeptical strategies used against dogmatic assertions and distinguishes Pyrrhonism from other philosophical schools. The last two books of the work offer particular skeptical refutations of dogmatic positions in logic, physics, and ethics. The first six books of *Against the Mathematicians* examine the skeptical approach to the six arts of grammar, rhetoric, geometry, arithmetic, astronomy, and music. The remaining books contain a detailed examination of the material covered in *Outlines*.

The importance skeptics like Sextus placed on the refutation of dogmatic assertions about god or the gods is evident at the beginning of book nine of *Against the Mathematicians*. There Sextus reasons that dogmatists generally think that philosophy aims to cultivate wisdom of divine and human matters. If, however, it can be shown that the arguments for the existence of divine things are no more conclusive than the arguments against them, then it will have been shown that philosophy is no such thing.

Sextus sharply distinguishes the skeptical position from ATHEISM, which he thought was merely another form of dogmatism. The skeptic wants to show that no argument for the existence of a god or gods has any more probative force than its opposite. Recognizing this, one can thus eliminate from one's life all anxiety about "divine matters" and assume a benign attitude toward religious practices. With the rejection of arguments for the existence of gods, dogmatic assertions about such things as divine providence should come to an end since, as Sextus reasons, we can hardly know anything about the nature of the gods if we do not know of their existence.

Among the arguments that dogmatists use to establish the existence of the gods are (1) the argument based on universal agreement, (2) a design argument, (3) a reductio ad absurdum of the position that denies the existence of the gods, and (4) arguments specifically designed to refute atheist arguments.

In his *Outlines*, Sextus recounts the following skeptical argument: If we know of the existence of the gods, this is either because their existence is self-evident or not. It cannot be self-evident, since there is no agreement on this among people. If the gods' existence is nonevident, then *that* is known either on the basis of something self-evident or on the basis of something nonevident. In the former case, their existence would again be self-evident. In the latter, there would be an infinite regress of nonevident reasons adduced, none of which are conclusive without a self-evident foundation. Hence, no argument for the existence of the gods is conclusive; nor is any argument purporting to conclude the opposite. The only rational position to take regarding the gods is the suspension of belief. Although Sextus does not call this position "AGNOSTICISM" (a modern term), it can be characterized as such.

As for the providence of the gods, Sextus reasons that either the gods are provident of everything or only of some things. If the gods are provident of everything, then either evil would not exist or the gods, supposed to be good, will themselves be responsible for it. If the gods are provident only of some things, then the gods are, counter to the view of theists, either weak or indifferent to the things over which they are not provident. In that case, they are malign. Hence, there is no reason to believe that even if the gods *did* exist, they would be provident; and with the rejection of providence goes fear of divine retribution.

LLOYD P. GERSON

***ENCYCLOPÉDIE, L'*, AND UNBELIEF.** A monumental and often heretical reference work, the *Encyclopédie, ou Dictionnaire raisonné des Sciences, des Arts et des Métiers* was published in Paris over some thirty years between 1751 and 1780. Almost from the outset, it met with vigorous opposition; its adversaries, both secular and ecclesiastical, succeeded for a time in preventing its publication, but the work eventually triumphed, not least of all because of the determination and commitment of its editor in chief, Denis DIDEROT. The *Encyclopédie* encountered hostility for many reasons, from its criticism of Cartesian philosophy (see DESCARTES, RENÉ) to its alleged plagiarism of the plates illustrating workshops and trades, as well as for alleged inaccuracies in articles dealing with a host of obscure and arcane subjects.

In looking at the role of religion in the *Encyclopédie*, two points should be noted. The first is that the work brought together dozens of contributors representing many shades of opinion on religion as on other matters, so that it is futile to seek any consistency of outlook even in the articles dealing with the same subject area. While a strong current of religious skepticism can often be discerned, religious belief per se was by no means excluded from the work. For one thing, it contained many articles written by pious authors who dealt in a wholly orthodox and unexceptionable way with aspects of Christian and Catholic doctrine. For another, several of the contributors might collectively be described as deists of one sort or another (see DEISM), that is, they believed in a divinity

of some kind, usually envisaged as a supervisory entity whose intervention in human affairs was limited to ensuring that the laws of nature operated as they should.

The second point is that the editors used a system of cross-references (or *renvois*) to lead readers from innocuous articles to ones that were far more critical of the status quo, especially in political and religious matters. Consequently, those pursuing a particular train of thought or a series of intricate connections often had a choice of paths before them, and might not all reach the same destination. In this way, the editors managed to conceal the more audacious contributions behind a fig leaf of respectability, and perhaps threw at least some pursuers off the scent.

Yet even if the contributors were not united in their beliefs, and even if various readings of the articles on religion and other contentious matters were possible, one can discern in the *Encyclopédie* a fundamentally skeptical and often hostile attitude toward religion in general, and toward Catholicism in particular. In many respects, the presentation and discussion of religious questions exhibit the characteristics to be found in other areas of the work as well: an avowedly rational outlook, a wide knowledge of history, and a strong dislike of repressive authoritarianism.

The rational approach was apparent from the first volume, where the editors led the way; here, as in other articles, their ostensibly emollient tone scarcely disguised their skepticism. In the "Preliminary Discourse" (1751), Diderot's then coeditor, D'Alembert, claimed that Christianity had nothing to fear from rational investigation, for its truth was guaranteed by God. However ridiculous a religion might be, philosophers merely pointed out its absurdities; unlike priests, they did not force others to accept their point of view. Diderot (who in reality was more troubled by spiritual questions than he sometimes affected to be), likewise tried to pretend that he wanted to reconcile doctrine with reason. In his article "Adorer" (1751) he slyly promoted the rational over the spiritual when he wrote: "The way in which we worship the true God must never forsake reason, because God is the author of reason, and he wishes us to use it even when we judge what we should or should not do with regard to Him." This rational approach to religion emerged not simply as a matter of abstract principle, but of comparative sociology as well. If one attitude in particular characterized the work of the more overtly "philosophical" contributors, it was their awareness of the wide variations between human societies, and the concomitant range of religious doctrines attested by history. For this reason, many of them saw the story of Christianity and of the Catholic Church not as proof of divine intervention in human affairs, but simply as another example of a religious sect, of which many could be found through the ages. This relativist view led essentially to two consequences.

The first was that such authors denied any transcendent status to Christianity—or indeed to Mohammedanism (Islam), Hinduism, or any other creed—and hence they rejected entirely the church's claim to supreme spiritual authority. Nor was this approach surprising in the mid-eighteenth century. The doctrinal and historical claims made on biblical authority had been subjected for decades to rational, scholarly analysis along the lines pioneered by such notable figures as Richard Simon and Baruch SPINOZA, and had been found wanting. The *Encyclopédie* article "Bible" (1752) duly discussed in respectful tones and with much erudite detail the many conflicting versions of that work which had been modified or rejected over the centuries, while taking care to point out that it was nonetheless "inspired by the Holy Spirit."

In addition, literary figures like VOLTAIRE had long made good use of historical sources to argue that religions owed their power chiefly to their ability to exploit the credulity of the people. An oblique expression of this view can be seen in Diderot's article "Agnus Scythicus" (1751). This describes an obscure plant for which noted authorities had repeatedly vouched, but which turned out to be nonexistent. Using this example, Diderot drew more general conclusions as to the dangers of accepting authority without question, and explicitly warned against believing in unspecified "superstitions" allegedly based on facts. Again, if instances of priestly (mis)conduct discussed in the *Encyclopédie* (in articles such as "Consécration" in 1753) prudently referred to the distant past or to primitive societies, they were worded in ways that invited comparisons with the priesthood of contemporary France. By these and other means, therefore, some of the major contributors to the *Encyclopédie* set before the public the results of sustained scholarly investigation relating directly or indirectly to belief, allowing readers to infer the insubstantial basis for the claims made by religion in general and, by implication, the Catholic Church in particular.

The second consequence of relativism was that, having challenged the historical justification for the church's power in a number of important respects, some contributors argued that believers and unbelievers alike should allow those who did not share their views to live peacefully without interference. This extract from the article "Fanatisme" (1756) by Deleyre sums up these aspects of the work: "Punish if you will the libertines who attack religion only because they cannot bear to submit to a yoke of any kind. Prosecute them as enemies of good order and of society; but pity those who, to their regret, are not believers. Is their lack of faith in itself not already enough to bear, without their being insulted and hounded as well?"

Although a number of contributors positively advocated toleration in spiritual matters, others made the same point by emphasizing rather the harm fanaticism could cause. They dwelled at length on the havoc the wars of religion had wrought in France in the sixteenth century; they also emphasized the damage done to the country's

economy by the expulsion of the Huguenots following the repeal in 1685 of the Edict of Nantes, which had put an end to those wars. Not least, they were keenly aware that, in contrast to France, the English did not allow religion to be all-powerful in the state; indeed, they knew that even if there were limits to her toleration, England's willingness to put commerce before creed had helped her to prosper, as Voltaire had so enthusiastically described in his *Letters concerning the English Nation* (1733).

Sentiments such as these were discernible in many articles, and at an early stage the authorities became suspicious of the *Encyclopédie*'s true intentions. Even some less outspoken contributions were anathema to a church whose place at the very center of French religious and political life was founded on its assertion that it alone possessed and taught the truth; any challenge to its authority was HERESY, and heresy must be extirpated by any means necessary. RATIONALISM, relativism, and toleration were ideas that threatened its very foundations, and those advocating such notions must, it urged, be punished severely.

All these entirely predictable reactions greeted the *Encyclopédie* as each new volume appeared, and they became increasingly vehement as its enemies leapt furiously upon every new outrage. The *Encyclopédie*'s skeptical attitude toward religion, more than anything else, accounts for the authorities' decision in 1759 to revoke its *privilege*, which allowed it to be published with official blessing. Thereafter, the *Encyclopédie* disappeared from public view for some years, although work on it continued clandestinely, with the connivance of the censor's office. While its enemies were by no means quiescent, growing demand for the *Encyclopédie* gradually rendered opposition ineffectual. The remaining volumes appeared, largely unimpeded, between 1765 and 1772; an index was added in 1780.

Suspecting that they had by this time effectively won the battle, some contributors now took matters to their logical conclusion, and denied with impunity that any notion of God was tenable. Perhaps the most forthright member of this group was the notoriously atheistic Jacques-André Naigeon, who wrote in "Unitaires" (1765): "[I]f we judge all religious doctrines in the court of reason, we thereby take a great step towards deism; but, what is more regrettable still, is that deism itself, whatever its apologists may say, is an inconsistent religion, and in trying to hold to it, we wander about without knowing where we are, and anchor ourselves in shifting sands."

As well as summarizing the state of human knowledge up to the middle of the eighteenth century, the *Encyclopédie* exhibits all the major conflicts that define the Enlightenment (ENLIGHTENMENT, THE, AND UNBELIEF): rationalism versus fanaticism; ATHEISM versus belief; informed, critical judgement versus dogma; and intellectual freedom versus intellectual stasis. Not all its contributors shared the same attitude toward religion, and many were mutually antagonistic. Yet it proved possible to accommodate them all within this one work, thereby furnishing an example of the tolerance that the *Encyclopédie* so powerfully advocated and its enemies so deeply loathed.

DAVID ADAMS

ENGLISH LITERATURE, UNBELIEF IN. Early hints of unbelief may be found in the stoicism of Anglo-Saxon writing and the individualism and ANTICLERICALISM of some medieval writing. However, there is no clear unbelief until the Renaissance, in particular the towering HUMANISM of William Shakespeare (see SHAKESPEARE, RELIGIOUS SKEPTICISM IN), the atheistic antireligion of the playwright Christopher Marlowe, and the skepticism of Walter Raleigh. There was greater devoutness in the metaphysical poets and sermons of the seventeenth century, until Restoration plays and poetry ushered in a greater secular freedom of expression. The DEISM of the eighteenth century was reflected in the ordered poetry of Alexander Pope and the piety of novelists such as Henry Fielding and Samuel Richardson.

At the end of the eighteenth century, piety began to give way, the influence of science and philosophy began to play its part, and specifically unbelieving literature began to be written—particularly by the poets Percy Bysshe SHELLEY and Lord BYRON. The nineteenth century was the age of doubt, especially in the English novel, where unbelief was apparent in the major novelists George Eliot (see EVANS, MARIAN) and Thomas Hardy.

Renaissance and Restoration. Anglo-Saxon and Old English writings were written first with pagan influence and then in a largely Christian context. By the time of Geoffrey Chaucer there was greater human individuation, influence from the early European renaissance, and anticlerical tendencies (foreshadowing the Reformation). Chaucer was influenced by Boethius and translated the latter's *The Consolation of Philosophy*; Boethius was probably a Christian but was imbued with classical writings. *The Canterbury Tales* depicts pilgrim travelers telling stories as they move on. There was ribald humor in the Miller's Tale, and indication of sexual enjoyment in the Wife of Bath's account of her five husbands. Religious figures can tell tales of a greedy friar or of the sale of indulgences (religious trinkets)—the kind of behavior that was to lead to the Reformation. However, a learned and charitable parson provides balance.

Shakespeare was a dramatist who is one of the greatest writers in world literature. He has been described in the title of a critical work by Harold Bloom, *Shakespeare: The Invention of the Human*. It is hard to assess his personal views: he seemed to embrace the multifaceted nature of his numerous characters. He has been described as a Catholic or an agnostic—but the evidence is poor. He certainly read John Florio's translation of the fine and skeptical essayist Michel de MONTAIGNE. There is no

sense of the divine in the plays, more a sense of the astonishing variety of human beings: "What a piece of work is a man! How noble in reason!" (*Hamlet*). Shakespeare is omnivorous in his working of human experience—all can claim him for their own. In the tragedies there are flaws or a sense of emptiness ("[A life] is a tale/Told by an idiot, full of sound and fury/Signifying nothing," *Macbeth*), of the cruelty of the gods (*King Lear*), but a culminating feeling that "ripeness is all."

Marlowe was a man of violence, a homosexual, a spy, and a superb dramatist. He was accused of being an atheist in the report of a government spy, suggesting that he "persuades men to ATHEISM willing them not to be afeard of bugbears and hobgoblins." A further allegation accused him of saying that "Christ was a bastard and his mother dishonest" and that "St. John the Evangelist was a bedfellow to Christ and leaned always to his bosome, that he used him as the sinners of Sodome." It is impossible to know the accuracy of these accusations, since they may have been part of an attempt to vilify him—but his plays suggest interest in both irreligion and homosexuality. Atheism during this period may have meant a belief that God played no part in human lives, rather than complete disbelief in a deity. Nevertheless there was fear that "the School of Epicure and the Atheists, is mightily increased in these days."

In Marlowe's first play, in two parts, *Tamburlaine the Great*, the mighty conqueror dies peacefully in his bed and is not brought low by his destruction as a Christian morality tale would have done. Two of his most famous lines come in *The Jew of Malta*:

> I count religion but a childish toy
> And hold there is no sin but ignorance,

The Massacre of Paris depicts the horrors of the conflict between religions and partakes both of his interest in violence and his presumed dislike of religion. His most famous play, *Dr. Faustus*, has the spiraling human desire to contain and control all, but a Christian conclusion with the overreacher ending in hell.

Raleigh, the explorer and poet, was accused of atheism—but the accusation may have been an attempt to discredit him. However, his essay "The Skeptick" summarizes the views of Sextus EMPIRICUS. Accusations and counteraccusations abounded in this period, suggesting that at the very least the ideas and writings played with ideas of unbelief.

The subsequent period of metaphysical poets and Miltonic epics shows a religious tenor in the writings, which was to some extent broken with the restoration to the throne of Charles II after the civil war and rule of Oliver Cromwell. Restoration comedy is renowned for its wit and bawdiness, and is entirely secular in nature.

The playwright and novelist Aphra Behn was probably the first British woman to earn her living by her writing. She wrote plays with all the wit and adventure of her colleagues. Her novel *Oroonoko, or the History of the Royal Slave* is based on her visit to Surinam, and contrasts the natural honor of the native Oroonoko with the faithlessness of the white Christians. The suggestion is that in this non-Christian country "religion would here but destroy that tranquillity they possess by ignorance."

A poet of the period, John Wilmot, Earl of Rochester, was an irreligious libertine. His poems were highly erotic and satiric. For instance his view of humanity was expressed:

> Bless me! thought I, what thing is man, that thus
> In all his shapes, he is ridiculous.

Wilmot did a poetic translation of some of the writings of LUCRETIUS. He returned to Christianity in the final months of his life.

In the eighteenth century, although it was said by Pope that "the proper study of mankind is man" and a civil urbanity characterized literature, the structure of thought was largely Christian. The development of the novel by Richardson and Fielding saw a Christian moralism struggling with moving accounts of amorous struggle. The influence of the Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE) was felt more with the philosopher David HUME and the historian Edward GIBBON (see UNITED KINGDOM, UNBELIEF IN).

Toward the end of the century a few minor novelists wrote in a more rationalist style (see RATIONALISM). Thomas Holcroft was a radical and playwright who thought that "philosophy is a true enemy to religion" and that "benevolence and morality" were the essence of religion. *Anna St. Ives* (1792) puts forward a vision of human happiness and depicts a conflict between Anna and Frank, who follow "the claims of truth and reason," and the villainous Clifton who relies on authority and violence.

William GODWIN (1756–1836) was married to Mary WOLLSTONECRAFT, who died in giving birth to Mary Godwin, who was to marry Shelley. Godwin's anarchist views were expressed in *Enquiry concerning Political Justice* (1793); his best known novel was *The Adventures of Caleb Williams* (1794), in which Caleb's contact with an aristocrat leads him to believe in universal morals and integrity apart from religion.

Romantics and Victorians. The first generation of romantic poets, particularly Wordsworth and Coleridge, adhered to a form of Christianity, but the second generation, namely, Shelley, Byron, and Keats, were atheists or agnostics.

Percy Bysshe Shelley was expelled from Oxford for publishing a pamphlet entitled *The Necessity of Atheism* (1811). His conflict with his father, a conventional Whig MP, led to the indignation which he felt toward God: "Oh! I burn with impatience for the moment of Xtianity's dissolution." He believed that God cannot be deduced from reason. His atheistic views were enlarged

in a note to his long poem *Queen Mab*, where he qualified his atheism with the view that the "hypothesis of a pervading Spirit coeternal with the universe remains unshaken." In this early poem he wrote of "the avenging God" as a "prototype of human misrule." His religious unorthodoxy was allied with a radical view of society—and a sympathy with working-class freethinkers and agitators. His poem *The Mask of Anarchy* presents a bitter, scathing view of the ruling class on the occasion of the Peterloo Massacre (an 1819 demonstration by radicals in favor of Parliamentary reform which was fired upon, resulting in several deaths). He modified the references to atheism, incest, revolution, and oppression in rewriting *Laon and Cynthia* as *The Revolt of Islam*. His works were published in pirated editions by working-class printers. His reputation as a radical in politics and religion was ironed out in the nineteenth century to leave a poet of prettiness, but his full reputation has been revived in the twentieth century.

His friend George Gordon, Lord Byron, was more of a skeptic than Shelley, finding that his beliefs wavered and constantly returned to the point of "not knowing." He scandalized upper-class Britain by his affair with his half sister Augusta and left England. His unfinished long poem *Don Juan* and his play *Cain* also shocked the literary world. *Don Juan* was at first condemned as "a filthy and impious poem," but its profuse seductions and satire slowly acquired an audience as it was published over the years. In the poetic drama *Cain: A Mystery,* Cain rages against his treatment by God and kills his brother Abel for sacrificing to God. The work was threatened with prosecution.

John Keats did not rage. His devotion to beauty, such as that of the Grecian urn and the richness of autumn, and his narrative sensitivity somehow made God irrelevant. Yet he was more realistic about human behavior than other romantics. He apparently refused religious assistance as he approached death from tuberculosis.

It was in the novel that the Victorian debate about religious belief was especially developed. The ever-popular Charles Dickens imbued his novels with a sentimental religiosity, despite some satirical portraits of men of the cloth, but the earnest AGNOSTICISM of George Eliot ran right through her fine novels.

George Eliot was a pen name for Marian EVANS. She went through an intense evangelical phase in her youth, but after acquaintance with the Unitarians Charles Bray and Caroline Hennell (see UNITARIANISM TO 1961) began to question her faith. She told her father she could no longer attend church regularly, which caused a rift resolved only by her agreement to attend and at the same time think what she wanted. She began to move in intellectual circles and translated D. F. STRAUSS's *Leben Jesu* (Life of Jesus), a work that undermined the theology of Jesus with a historical and skeptical approach. Later she translated Ludwig FEUERBACH's *The Essence of Christianity*, which gave a naturalistic account of Christianity. She was effectively the editor of the leading *Westminster Review*.

Yet it is as a novelist that she is primarily remembered, her two most substantial works being *Middlemarch* and *Daniel Deronda. Middlemarch* portrays the complete community of a provincial town. The heroine, Dorothea Brooke, yearns for meaning in her life—meaning without traditional religious views. Two Christian figures are deeply flawed—Casaubon, who cannot complete his mighty work on mythology; and Bulstrode, a nonconformist hypocrite. The scientifically inclined Dr. Lydgate is portrayed more sympathetically. *Daniel Deronda* examines the Jewish religion, giving some support to the development of Zionism. Eliot believed that art should enhance human sympathies and had a duty to tell the truth about human nature and society.

Some lesser novelists also explored religious doubt. J. A. Froude, who became a very successful historian, wrote *The Nemesis of Faith* (1849) to depict those of high intellectual stature departing from religious faith. (The book was burned on a college fire, a disapprobation which only gave it more publicity. Froude's father was an archdeacon—one of the many active or renowned religious men who spawned a freethinking child.) The despairing author and apostate typically retained strong ethical principles. This was a common theme in life and literature and, for example, the protagonist of Mrs. Humphry Ward's *Robert Elsmere* also demonstrated strong ethical principles in working among the poor of the East End of London.

The poets of the period were less engaged with this debate, but Tennyson and Browning alluded to religious doubt, Tennyson in his *In Memoriam*, a lament for the loss of his friend Hallam, and Browning in poems such as *Bishop Blougram's Apology,* a monologue depicting an argument between the bishop and an unbeliever. Algernon Charles SWINBURNE, a disciple of Sade in theory and practice, allowed irreligion to streak through his poetry. Arthur Hugh CLOUGH was the very apogee of sincere doubt.

More to the heart of unbelieving Victorian poetry were the works of Matthew ARNOLD and James Thomson. Thomson was a secularist and friend of the atheist campaigner Charles BRADLAUGH. Thomson's poetical masterpiece is *City of Dreadful Night*, the portrait of a godless city of darkness, poverty, hopelessness, and depression. Matthew Arnold, a doubter who doubted even his own doubt, bequeathed some of the most famous lines on the decline of religion in *Dover Beach*: He described the Sea of Faith and its "Melancholy, long, withdrawing roar . . ."

A novelist who was also a poet was Thomas Hardy. There is no Christian comfort for the fated characters of his novels. In *Jude the Obscure* (1895) the central character, who was trying to study theology, takes all his books into the garden and burns them, a scene that shocked readers even at the end of the Victorian era.

Some of Hardy's poems have a distinctly anti-Christian tendency: In *The Wood Fire*, soldiers plan to make a fire of what has been the cross on which Jesus was crucified; in another he writes of *God's Funeral*.

Walter Pater was an art critic and novelist who knew Mrs. Humphrey Ward and Swinburne. He turned from his original plan of being ordained. He became well known for his *Studies in the History of the Renaissance* (1873), which was among those works of the time re-examining the Renaissance for its human and aesthetic brilliance. His novel *Marius the Epicurean* (1885) depicts a fictional character at the period of Marcus Aurelius and is influenced by the latter's stoic philosophy (see STOICISM). He influenced Oscar Wilde, whose brilliant drama overshadowed his serious work. *The Soul of Man under Socialism* (1891), written under the influence of George Bernard SHAW. Shaw was one of the major playwrights of the twentieth century, who rejected orthodox religious belief in favor of a belief in "the life force."

William Morris also broke from Christianity and developed his own version of socialism (see SOCIALISM AND UNBELIEF) that posited a value for all in the community and the importance of works of art for their function in daily life. His utopian novel *News from Nowhere* (1891) shows London and its environs turned into a socialist paradise. Another work of fantasy, *Erewhon* (1873), was composed by Samuel BUTLER, a person whose clerical family's intention that he pursue a life in the church was frustrated by Butler's unorthodox intellectual development. The Erewhonians appear to have little or no religious belief; academe is dominated by the Colleges of Unreason and ethics are based on the behavior of the "true gentlemen." *The Way of All Flesh* (published posthumously in 1903) satirizes Victorian religious practices more sharply. Butler was fascinated by Charles DARWIN's theory of evolution (see EVOLUTION AND UNBELIEF), but preferred an alternative Lamarckian explanation allowing for the hereditary transmission of acquired characteristics.

George Meredith was a nonbelieving Victorian novelist and poet who believed in the importance of rationality. Although he is now out of fashion as a novelist, two of his novels contain fine portraits of men and women in the search for a moral understanding of their lives and the world around. *The Ordeal of Richard Feverel* (1859) recounts the education of the eponymous hero as a "scientific Humanist" who finds life and love in the power of nature. *The Egoist* (1879) is "a combination of wit and humanity." Beyond the brittle ego there is a belief in the uniting of reason and instinct. Meredith's freethinking is demonstrated in his letter to the editor of the *FREETHINKER*, G. W. FOOTE, whose work he called "the best of causes."

The Twentieth Century. H. G. WELLS spanned the nineteenth and twentieth centuries, being essentially a scientist turned novelist and social commentator. Such a development tends to lead to rationalism. From lowly beginnings he was eventually educated at the Normal School of Science (London), where he came under the influence of T. H. HUXLEY.

A considerable amount of self-education took place with his reading of VOLTAIRE, Jonathan Swift, Thomas PAINE, and Gibbon. His early works were science fiction—a genre that enabled him to give the reader excitement and social comment at the same time. He wrote of one character's "innate skepticism"—a perspective that he maintained himself, occasionally giving way to vague theism.

His greatest novel was *Tono-Bungay*—a "condition of England" novel, which surveyed an entrepreneur's rise in English life by the sale of a patent medicine with the aid of advertising. Wells laced his novels with adventure and humor, which accounted for their success—but scientific and socialist ideas lay underneath.

Wells also wrote books popularizing knowledge. Two early volume's of the Thinker's Library published by the RATIONALIST PRESS ASSOCIATION were *First and Last Things* (1909) and *A Short History of the World* (1922). He became an honorary associate of the RPA in 1929. He offered a late work, *Mind at the End of Its Tether* (1945), to the RPA for publication—but it was not accepted, publisher C. A. WATTS being unhappy with its pessimism, a constant strand of Wells's thought, exacerbated by the World War II and his own declining health. Atheism and optimism need not go hand in hand.

Arnold Bennett, a chronicler in fiction of provincial life, knew Wells and was also an honorary associate of the RPA.

E. M. Forster, one of the most distinguished novelists of the twentieth century, was a certain unbeliever, who in later life had contact with humanist organizations such the Cambridge Humanist Society, the BRITISH HUMANIST ASSOCIATION, and the RPA.

His six novels have become classics, studied and filmed. *Howards End* (1910) is comparable to *Tono-Bungay* in attempting to exemplify the condition of England through characters and milieu. It pleads for people to "only connect"—between the world of heart and relationships and the milieu of business and finance. *A Passage to India* (1924) aims to break through colonial insensitivity to the complex world of the Indian people and Indian civilization.

In his later life Forster defended free speech and tolerance and in a famous essay, "What I Believe" (1938), he wrote: "I do not believe in belief . . . tolerance, good temper and sympathy—they are what matters really. . . . My law givers are ERASMUS and Montaigne. . . . My motto is 'Lord I disbelieve . . . help thou my unbelief.'"

Virginia Woolf, like Forster, embedded her ideas in her sensitive novels. Her father was Leslie STEPHEN, who wrote on agnosticism. She was a member of the Bloomsbury group (an extended artistic coterie of family and friends based in that part of London) and suffered from mental illness during many parts of her life, leading eventually to suicide.

Her novels show characters searching for meaning, some of whom are explicitly atheistic. In *Mrs. Dalloway*, "Clarissa Dalloway was 'one of the most thoroughgoing skeptics he [her husband] had ever met'; nevertheless she found life could be bleak and unhappy and needed to alleviate distress by decorating 'the dungeons with flowers and air-cushions.'" Later she thinks "love and religion! . . . how detestable, how detestable they are." Woolf uses a stream of consciousness technique in her later work and the idea of an epiphany—an ecstatic moment of all-pervading meaning. A character in *The Lighthouse*, on finishing a painting, declares, "Yes, I have had my vision"—but a secular vision.

James Joyce likewise uses stream of consciousness and the epiphany in a more original way. His autobiographical *Portrait of the Artist as a Young Man* (1914–16) shows the young man moving away from Irish nationalism, the Catholic Church, and his family. The hellfire sermon of Father Arnall gives an appalling picture of hell likely to deter people from belief in Christian dogmas. His masterpiece, *Ulysses* (1922), ranges over the day and life of a group of Dubliners in a totally secular vision of the richness and variety of life.

Later twentieth-century novelists demonstrate how unbelief had become the mainstream for English literature. This is demonstrated in, for instance, the works of George ORWELL, Aldous Huxley, C. P. Snow, Margaret Drabble, Iris Murdoch, Maureen Duffy, Angus Wilson, Brian Moore, and the plays of Arnold Wesker and Harold Pinter, as well as the plays and novels of Samuel Beckett.

The epitaph for this survey could be Forster's words. "Lord I Believe—Help thou my unbelief."

ENLIGHTENMENT, UNBELIEF DURING THE. Enlightenment unbelief was—or appears to have been—overwhelmingly deistic. Since DEISM is examined elsewhere in this work, I shall be concerned here with varieties of unbelief during the Enlightenment other than deism: that is, with the outright denial of the existence of God and of personal immortality. Complete unbelievers such as Paul Henri HOLBACH accepted the deistic critique of revealed religion, but rejected the two articles of natural religion that deists still retained, namely, God and an afterlife. Although not all those who denied the existence of an afterlife—the mortalists—were atheists, the history of ATHEISM and that of mortalism are closely connected.

Avowed atheism and mortalism emerged late in the Enlightenment—in 1770 on the continent and 1782 in Britain. Their comparative infancy has been obscured by, for instance, the tendency of scholars to confuse accusations of atheism and mortalism with professions of the same. Historians have assumed that with so much polemical smoke there must have been some atheistic fire. The Boyle lectures are prominent among the hundreds of eighteenth-century treatises written against atheists, and the *Guardian* essay of June 23, 1713, which castigates certain unnamed "dull and phlegmatic [men who] prefer the thought of annihilation . . . [and] endeavour to persuade mankind to [their] disbelief," is characteristic of the popular literature against mortalists.

Another way in which the smoke of religious apologists has tended to invent a history of atheism is that in order to cast doubts on the originality of their opponents, apologists presented even the most novel attacks on religion as rather old-fashioned. But there is nothing old-fashioned about professed atheism. The Enlightenment does show us something new. For the first time, a handful of people openly denied the existence of God and regarded themselves as atheists. To bring into focus this unprecedented event in the history of ideas and of unbelief, we must distinguish (1) avowed published atheism from (2) avowed posthumously published atheism from (3) reports of covert atheists from (4) covert implied atheism from (5) positions that tended toward atheism or could be exploited by atheists. Most historians have obscured the genesis of atheism in the Enlightenment in that they have conflated these different classes, especially (1) and (5); and the history of mortalism has fared similarly.

Avowed Published Atheism. Since this is the most straightforward type of atheism, it should provide the focus for a historical study. If a published work contains a denial of the existence of God—particularly if it is argued—or a profession of atheism, then it can be considered a work of atheism and the author regarded as an atheist. Of course, we assume in such cases that the author is using such key terms as *God*, *wisdom*, and *matter* in a literal and normal way, and that he is not, for example, speaking ironically or idiosyncratically. By such a standard we must see Baron d'Holbach's *La Système de la Nature* (1770) as a model of straightforward atheism, even though its title page falsely states that it was written by Mirabaud and was printed in London (in fact, it was printed in Amsterdam). Not only does it contain the first published denials of the existence of God and (probably) of an afterlife, but it also extensively argues the case for total unbelief.

The *Système* has two parts: in the first part d'Holbach outlines his empirically grounded MATERIALISM and DETERMINISM, in chapter 13 rejecting immortality as "an illusion of the brain." The second part is overtly atheistic; in chapters 2 and 3 he critically examines the most formidable arguments for the existence of God, which, he says, "have their origin in the false principle that matter is not self-existent or able to move itself."

D'Holbach's defense of atheism is, however, based not solely on his belief that matter is a necessary, uncreated substance eternally in motion, or on his detailed criticism of arguments for the existence of God, such as that given by Samuel Clarke. He also tried to show that there is a conflict within the theologian's conception of God. Moving hopelessly between the incomprehensible immaterial God of the philosopher and the affecting but all-too-human God of the ordinary worshiper, the theologian united the "metaphysical God" of natural theology with the anthropomorphic God of revealed religion (see ANTHROPOMORPHISM AND RELIGION). In short: How can "an immutable deity . . . cause those continual changes in the world?" and "How shall we attribute anger to a being who has neither blood nor bile?" The God of the theist and of the deist "is nothing but a mere fiction." D'Holbach also argued that materialistic atheism, with its naturalistic ideals of man's happiness and his survival, provides the only solid foundation for morality and social prosperity.

In 1772 d'Holbach published the *Bon Sens*—a work deeply indebted to the *Testament* of Jean MESLIER—which gave popular expression to the former's atheism. Four years later d'Holbach developed the moral aspect of his atheism in *La Morale Universelle*. D'Holbach was assisted in these classic atheistic works by his friend Jacques-Andre Naigeon, the "monk of atheism," who wrote the preliminary discourse to the *Système*. Naigeon's own atheistic position in the *Philosophie Ancienne et Modern* (1791–94), although in general agreement with d'Holbach's, emphasizes the life sciences as against the physical sciences. Denis DIDEROT, the third and most famous member of the atheistic triumvirate, helped d'Holbach, too, especially with the *Système* and the *Bon Sens*. Diderot was well known as an atheist—Samuel Romilly described his conversation in 1781 as "ostentations of total unbelief"—yet his celebrated radical writings, such as *Le Rêve de D'Alembert,* were not only less explicit than those of his two colleagues but were published posthumously.

Perhaps the most shocking French atheist was the Marquis de SADE. In literary works such as *La Philosophie dans le boudoir* (1795) he argued not only for speculative but also for "practical" atheism (immoralism).

The first avowedly atheistic publication in Britain was *An Answer to Dr. Priestley's Letters to a Philosophical Unbeliever* (1782). This little-known book purports to be the work of two men. The editor, who signed himself William Hammon, is responsible for the advertisement, the prefatory address, and a postscript containing a letter to Joseph Priestley. The body of the work is supposed to be by a friend of the editor. This unnamed friend has been identified as Matthew Turner, a Liverpool physician, anatomist, classical scholar, and friend and helper of Josiah Wedgwood. Turner popularized the use of ether for medical purposes and lectured at Warrington Academy, where his lectures first interested Joseph Priestley in chemistry. The atheism of the *Answer to Priestley* is influenced most by d'Holbach's *Système*, which Turner quotes at length, and by David HUME's *Dialogues concerning Natural Religion* and his essay "Of Miracles."

The material world, Turner and Hammon urged, should be considered not as contingent, but as eternal and sufficient to explain any order or design in the world. They also argued against the orthodox claim that morality and social order require a religious foundation. Whereas Turner is at his best when pressing the argument from evil (see EVIL, PROBLEM OF), Hammon's most interesting comments are on the difficulties of being an atheist. Like d'Holbach, Hammon was aware that the possibility of atheism is widely disputed; like d'Holbach, he firmly resisted this repressive tendency: "[A]s to the question of whether there is such an Existent Being as an atheist, to put that out of all manner of doubt, I do declare upon my honor that I am one." Hammon also rejected (although more tentatively than d'Holbach) a future life. For nearly thirty years, until Percy Bysshe SHELLEY's *Necessity of Atheism* (1811), the *Answer to Priestley* was the only English work of avowed atheism.

Clandestine Atheism. The abbé Jean Meslier stands beside d'Holbach as the second giant of atheism. At his death in 1729 Meslier left three copies of his massive atheistic *Mon Testament.* Although not printed in its entirety until 1861–64, more than a hundred clandestine manuscript copies of the *Testament* were circulating in Paris alone by the middle of the eighteenth century, or so claimed VOLTAIRE, who in 1762 published a deistic *Extrait* of it. In some respects Meslier's achievement is even more extraordinary than that of d'Holbach. Not only did d'Holbach make extensive use of Meslier's work for *Bon Sens,* but Meslier seems to have worked out his all-embracing atheistic and mortalistic position in virtual isolation, whereas d'Holbach had the advantage of his brilliant coterie and their regular meetings at his Paris home, nicknamed the "Synagogue." Like d'Holbach, Meslier was a materialist and a determinist; just as d'Holbach argued at length against Clarke's 1704 *Demonstration of the Existence of God,* Meslier argued against Archbishop Fénelon's similarly themed *Demonstration* (1712). Meslier and d'Holbach are avowed, militant, and total unbelievers, who bring nearly every aspect of religion—natural as well as revealed, the soul as well as God—under unrelenting criticism. Of course, d'Holbach's atheism was openly avowed and published,

whereas Meslier confided his avowed atheism only to his posthumously published manuscripts.

Although Meslier was the most outstanding clandestine atheist, he was not the only one. Other atheistic and mortalistic manuscripts—although none as explicit as the *Testament*—were circulating clandestinely in France, and to a lesser extent in Holland and in England, in the eighteenth century. Thus the *Dissertation sur la Formation du Monde*, an anonymous manuscript dated 1738, argues that God cannot have created the world because creation is inconceivable. And in the fourth chapter of the even more radical *Essais sur la Recherche de la Verite*, a manuscript dated around 1740, the author argues against the existence of God by showing that certain of his alleged attributes—for example, infinity and immateriality—are incompatible with one another.

Some of the clandestine manuscripts can be traced to the so-called Boulainvilliers coterie, among whom were Henry de Boulainvilliers, N. Fréret, César Chesneau Dumarsais, and Jean-Baptiste de Mirabaud. In 1743 a largely skeptical collection of five anonymous clandestine tracts was printed with the title *Nouvelles Libertés de Penser.*

Reports of Covert Atheists. While one must be cautious about accepting reports concerning Enlightenment atheists, one should not be entirely incredulous. We know that there were militant atheists who were prepared to avow their atheism verbally and in print (d'Holbach) and militant atheists who were not (Meslier). Clearly, autobiographical reports—such as William GODWIN's (in the Bodleian Library) that "I became in my 36th year [i.e., in 1792] an atheist"—are of the most compelling historical value; failing these, firsthand reports by atheistic friends must weigh more heavily than those by religious enemies. Among the more credible of such reports we find the names of Claude Adrien HELVÉTIUS and Augustin Roux of the Holbach coterie, and, in England, Erasmus DARWIN and Jeremy BENTHAM. However, in none of these cases is the evidence decisive, nor, more importantly, have any published or unpublished atheistic works been tied to these putative atheists. In the same way the evidence is unclear in Matthew TINDAL's case, for although the reports of his atheism are allegedly firsthand and contain interesting details, they are recorded by opponents rather than friends.

Covert Implied Atheism. Somewhat different is the case of Anthony COLLINS, who was reported by George Berkeley to have said that he had found a proof for the nonexistence of God. Although Berkeley was no friend of Collins, there is reason to believe that his firsthand testimony is reliable; it is also supported by secondhand reports. I have argued that some of Collins's published works are covertly atheistic, that his atheistic position was shared by his friend John TOLAND, and that their common position, which may be described as pantheistic materialism, was embraced by other so-called deists (see PANTHEISM AND UNBELIEF).

One of the most interesting pantheistic materialists was Albert Radicatti, count of Passeron. He lived for a time in England, where he published his radical philosophical works, the most important of which is *A Philosophical Dissertation upon Death* (1732). In the first ten or so pages Radicatti boldly sketched a materialistic version of pantheism, which clearly replaces theism or deism. "By the Universe," he wrote, "I comprehend the infinite space which contains the immense matter. . . ." Radicatti argued that matter and motion "are inseparable"; they are "of eternal co-existence" and they "exist necessarily." Because motion is essential to matter, and since both are necessary and eternal, no God was needed to add motion to matter or to create the world. But Radicatti made God not merely superfluous; he made him equivalent to the material world: "This Matter, modified by Motion into an infinite Number of various forms, is that which I call NATURE. Of this the qualities and attributes are, *Power, Wisdom, and Perfection,* all of which she possesses in the highest degree."

Neither Collins nor Radicatti denied the existence of God in his published works. Indeed, in *Twelve Discourses concerning Religion and Government* (1734), Radicatti goes out of his way to rebut the charge of atheism directed against Collins and others: "To say that Deists are Atheists is false; for they that are so-called by the Vulgar, and by those whose interest it is to descry them, admit a first cause under the names of God, Nature, Eternal Being, Matter, universal Motion or Soul. Such were Democritus, EPICURUS, Lucian, SOCRATES, Anaxagoras, Seneca, HOBBES, Blount, Spinosa [see SPINOZA, BARUCH], VANINI, St. Evremond, BAYLE, Collins and in general all that go under the name of Speculative Atheists; and none but fools or madmen can ever deny it. So that the word Atheist must signify Deist, or nothing, there being no such thing as an Atheist in the world."

By these standards it will be difficult, however, to imagine anyone who could be an atheist; and I have argued elsewhere that Radicatti's real aim was to encourage atheism by doing away with its negatively emotive name. For the pantheistic materialism of Radicatti, Collins, and Toland is not substantially different from the patently atheistic position of Meslier and d'Holbach. They all regarded the material world as an eternal, infinite, determined entity, which is self-caused, and believed it is possible to explain the order (and disorder) of the world without recourse to a transcendent immaterial being. The main difference is that whereas the position of Meslier and d'Holbach is overtly atheistic, that of Collins, Toland, and Radicatti is covert and implied.

Two late works of covert atheism which come close to being overt are: *Watson Refuted* (1796) by Samuel Francis and *An Investigation of the Essence of the Deity* (1797) by "Scepticus Britannicus." Francis not only rejected theism but went, as he tells us, "much further"

than deism. Although he did not avow atheism or argue in its favor, he is plainly sympathetic toward it: "The world has too long been imposed upon by ridiculous attempts to vilify atheists and show their non-existence."

Scepticus's succinct *Investigation* is more important than *Watson Refuted*, however, in that it does argue for atheism by showing contradictions in the "theological Deity." God's alleged omnipotence, for example, is in conflict with his apparent inability to prevent Adam from sinning. God is supposed to be immutable, but he is also said to change his mind; and if he is immutable, "how truly ridiculous it is . . . to pray to him to alter His intentions." In the postscript, Scepticus's target shifts from theism to deism. Thus, deists such as Thomas PAINE claimed that God was omnipotent, but they also argued that he was incapable of producing the Bible. Nor could the deists explain "how an immaterial Being could create [i.e., from out of nothing] matter. . . ." Although Scepticus's atheism is not avowed, his pantheistic materialism is: "The Deity is material . . . in fine . . . the universe, or the whole material world is God."

Was Hume a covert atheist? My suspicion is that he was, although the scholarly consensus seems to be that he was not. One Hume scholar has recently described him as an "attenuated deist." There can be little doubt that Hume's arguments, especially in the *Dialogues*, bring him very close to atheism, even though it is not the sort of atheism of Scepticus or d'Holbach. Hume would have repudiated the metaphysical atheism of pantheistic materialism in favor of a more skeptical and epistemological variety. In the *Dialogues* he gradually but devastatingly stripped the concept of God of religious meaning, showing that the empirical evidence cannot warrant the inference to a creator of the world that is in any literal sense a wise person. At most Hume seemed prepared to allow that it is "probable that the principle which first arranged, and still maintains, order in this universe, bears . . . some remote inconceivable analogy to the other operations of nature, and among the rest the economy of human mind and thought."

Such an affirmation of God is, I would suggest, tantamount to a confession of atheism. Hume's attenuated conception of God and his statement that the "Atheist . . . is only nominally so, and can never be in earnest" should be interpreted along the same lines as I have interpreted Radicatti's statements.

While there seems to be little or no firsthand testimony that Hume considered himself an atheist, there is ample evidence from James Boswell's journals that he regarded himself as a mortalist. In 1776 Boswell recorded Hume as saying that "it was a most unreasonable fancy that we should exist forever." Thus Hume's essay "Of the Immortality of the Soul" must be seen as a case of covert implied mortalism. Here it is helpful to compare Collins and Hume, whose affirmations of conditional (gospel) immortalism are remarkably similar. At the beginning of his essay Hume asserted that "in reality, it is the gospel, and the gospel alone, that has brought life and immortality to light"; and in the *Discourse of Free-Thinking* Collins wrote that "the true Principles upon which the immortality of the Soul depends, are only to be fetched from the New Testament." The arguments of both men, however, are utterly subversive of the doctrine. Hence I am drawn to see Collins as a covert mortalist on the model of Hume, even though there was no Boswell present to chronicle his mortalistic profession. Similarly, I think we should see Hume as a covert atheist even though there was no Berkeley to record his denial of the existence of God.

Positions That Tend toward Atheism. In any case, there can be no doubt that Hume's works nurtured atheism, even if they did not imply it; and a similar judgment can be passed, a fortiori, on the works of Collins, Radicatti, and Toland. Enlightenment atheism was helped mainly by Thomas Hobbes, Baruch Spinoza, Charles Blount, Pierre Bayle, Lord SHAFTESBURY, and John LOCKE. Hobbes contributed materialism and empiricism; Spinoza, pantheism and militant RATIONALISM; and both a defense of determinism. Blount helped by translating and popularizing irreligous works—by Hobbes and Spinoza, among others—and also by writing some of the most provocative tracts of the seventeenth century, most of which are included in his *Miscellaneous Works* (1695). Bayle fostered atheism by the skepticism of his *Historical and Critical Dictionary* and, in his *Reflections of a Comet*, by severing religious belief from moral behavior and social order, a process that was continued by Shaftesbury. Locke's contribution was his epistemological approach, his empiricism and moderate rationalism. Although these thinkers rendered important services to atheism, and particularly to d'Holbach's 1770 synthesis, it seems unlikely that any of them, with the possible exceptions of Hobbes and Blount, was a covert atheist.

DAVID BERMAN

EPICURUS (341–270 BCE), Greek philosopher. Epicurus was the founder of the Epicurean school of philosophy, a leading intellectual movement of the Hellenistic era that began as an outgrowth of the atomism of Democritus and Lucippus. He was born in Samos, also the birthplace of Pythagoras. Along with several colleagues, Epicurus wrote numerous works that came to serve as the canon for the school. Epicurus alone authored about three hundred works, most notably his definitive treatise *On Nature*. The most important site of Epicurean scholarship and learning was located in a garden outside Athens, and yet Epicureans did not seek a garden of earthly delights of the sort that the modern term *epicurean* has come to invoke. For them happiness lay in the cultivation of the pleasures of knowledge, friendship (Epicurus's disciples were called simply the Friends), and simple and natural bodily experiences, which could be found in even the most modest everyday meal. More importantly, Epicurus taught that the key to achieving the good life was overcoming fear of pain and fear of gods. Epicureans sought to avoid the rigors of public life, but they accepted the legitimacy of civil law and justice as a prudent strategy for coordinating the interests of individuals. While Thomas JEFFERSON held up a Stoic philosopher, Epictetus, as a theorist of civic virtue (see STOICISM), in ethics Jefferson was much more Epicurean, as he once confided in a letter to a friend: "I consider the genuine (not the imputed) doctrines of Eipicurus as containing everything rational in moral philosophy which Greece and Rome have left us."

A radical empiricist about knowledge (see EMPIRICISM) and a materialist in metaphysics (see MATERIALISM, PHILOSOPHICAL), Epicurus envisioned an atomistic world composed of an infinite quantity of indissoluble particles moving in an infinite quantity of absolute void, governed by three natural laws of weight, collision, and an indeterministic factor, the "swerve." From the novel patterns initiated by the swerve, Epicurus generated a naturalistic model of human free will. In keeping with his metaphysics, Epicurus rejected the personal deities of traditional religion that interact meaningfully with the rest of nature. Epicurus gave a very clear statement of the theological problem of evil: "Either God want to abolish evil, and cannot; or he can, but does not want to. . . . If he wants to, but cannot, he is impotent. If he can, but does not want to, he is wicked. . . . If, as they say, God can abolish evil, and God really wants to do it, why is there evil in the world?" (see EVIL, PROBLEM OF). He cited the existence of crocodiles as part of the evidence against a benign creator. However, reasoning that the widespread belief in the gods required some explanation, he concluded that the gods have a real existence, but as images or shades of a peculiar kind composed of extremely fine atoms. These image-beings occupy the spaces between the universes, our universe being only one of an infinite number. There they do nothing but experience a kind of placid contentment, in an endless ideal representation of the Epicurean good life. The gods are not persons, nor creators of the world, and they are in no way concerned with human affairs. Accordingly, prayer is ineffectual because the gods are unresponsive. In any case, people are sufficient for their own happiness. Still, people should not entirely spurn the religious traditions of the culture in which they find themselves, since this would only create discord and confrontation with fellow community members. Furthermore, contemplation of the gods is a natural kind of meditation that can have salutary effects on the mind.

Famously, Epicurus argued that although death results in the annihilation of the self, we have nothing to fear from it: "Whatsoever causes no annoyance when it is present, causes only a groundless pain in the expectation. Death, therefore, the most awful of evils, is nothing to us, seeing that, when we are, death is not come, and when death is come, we are not. It is nothing, then, either to the living or to the dead, for with the living it is not and the dead exist no longer." The wise person, therefore, overcomes fear of pain, death, and gods and is freed to spend his days in peace, repose, friendship, intellectual study, and play: "The true understanding of the fact that death is nothing to us renders enjoyable the morality of existence, not by adding infinite time but by taking away the yearning for immortality."

AUSTIN DACEY

ERASMUS, DESIDERIUS (1466–1536), Dutch scholar and humanist. An early and internationally known Dutch humanist (see HUMANISM), Desiderius Erasmus was born in Holland at either Rotterdam or Gouda, the illegitimate son of a priest. Erasmus studied in Holland and was ordained a priest in 1492. Disliking monastic life, in 1494 he became Latin secretary to the bishop of Cambray. The next year he went to the University of Paris to study theology, but he did not like scholastic philosophy.

In 1499 Erasmus went to England, where he became a friend of the humanists John Colet and Thomas More. Erasmus increasingly devoted himself to the study of the classics and sacred literature. He combined the new humanism, based on the revival of interest in the classics, with Christian learning. In 1500 he returned to the Continent and devoted himself to the study of Greek.

Liberal and reformist theologians and classical scholars were inspired by Erasmus. He became important in the movement for reform of the Catholic Church. But when the reform movement developed into a radical direction, Erasmus tried to stay aloof from it. When Martin Luther became more aggressive and violent in his words, and when other reformers criticized Erasmus for his refusal to join them, he pointedly withdrew.

In 1524 Erasmus came out against Luther in his *On Free Will*, in which he argued against Luther's views on the free will. Luther replied sharply in his *De Servo Arbitrio* (1525). Luther could not stomach Erasmus's gentle SKEPTICISM and his willingness to accept Catholic teachings. As matters unfolded, Erasmus to a large extent broke with the reformers.

In his thinking Erasmus advocated a "philosophy of Christ" as different from various scholastic theories. The "philosophy of Christ" was to be reached by pious studies rather than by disputations. By this Erasmus intended to convey a simple form of Christianity, not a systematic theology but a message to be lived.

On the whole, Erasmus was a scholar. He seems to have been a moderate and cautious Christian, rather than an agnostic. It is not likely that he was ever an atheist (see AGNOSTICISM; ATHEISM).

ETHICAL CULTURE. In some cases, yesterday's unbelief becomes today's commonplace. Unbeliefs are always contextual, shaped by time and place. The Ethical Culture movement provides a test of such generalizations. Ethical Culture, like many religious movements, stemmed from a prophetic individual who selected from and recast his inheritance.

Felix ADLER was born in Germany in 1851 and immigrated to the United States when his father became rabbi of New York City's Temple Emanu-El, the wealthiest Jewish congregation in the country. After graduating from Columbia University, he studied for the rabbinate in Berlin and Heidelberg. In 1873 in his first sermon at this temple he called for "[a] religion not confined to church and synagogue alone shall go forth. . . . A religion such as Judaism claimed to be—*not of the creed but of the deed*."

Although what would come to be known as Reform Judaism was already emerging within German American Jewry, this vision was too extreme, and young Adler left with a small group of enthused supporters. Three years later, in a rented hall, he expanded upon these themes, leading to the incorporation of a Society for Ethical Culture: "Judaism was not given to the Jews alone, but . . . its destiny is to embrace in one great moral state the whole family of men. . . . We propose to entirely exclude prayer and every form of ritual. . . . Freedom of thought is a sacred right of every individual man. . . . Diversity in the creed, unanimity in the deed."

Such statements evoked the wrath of orthodox Jews and Christians. Adler was processing his admiration for Ralph Waldo EMERSON's new "moral religion" and Immanuel KANT's rational morality, both highly controversial heresies in their time. In addition, the academic world was digesting Charles DARWIN's new theory of evolution that devastated design justifications for a god (see EVOLUTION AND UNBELIEF), which, for thoughtful theologians, had remained as the last intellectual defense of any kind of orthodoxy.

Critics perceived an actual ATHEISM in Adler's AGNOSTICISM, whereas a much smaller group of supporters viewed it as the only survival platform for any kind of religion.

Also influencing Adler was his participation in the Free Religious Association. Founded in 1871, mostly by Unitarians alarmed by a growing creedalism in their own denomination, ideas such as transcendentalism and scientific theism were surfacing here, along with explorations of religion beyond liberal Christianity and Judaism. In 1878 Adler was elected president of the Free Religious Association. Frustrated by discussions that did not lead to concrete action, he resigned in 1882—and this may have crystallized his decision to move ahead with the new organization and career.

Adler's new society based itself upon what he called the Supreme Ethical Rule: "Act So as to Elicit the Best in Others and Thereby Thy Self." Adler was able to assemble and hold the intense loyalty of a group of successful and wealthy New Yorkers, and to motivate them to focus upon needs of the community. For persons of Jewish background, this was a clear element of their heritage. Ethical Culture's absence of metaphysical discussions, religious identities, behavioral laws, and rituals helped maintain this focus and eliminate distractions. Adler's vision continually opened new areas of ethical advance. He was successful in stimulating societies in other cities and in recruiting and guiding the education of future leaders. Within a few years, additional societies were established in Chicago, Philadelphia, and St. Louis that still are strong.

At the same time, Adler was continually guiding the education of potential leaders. Most of these early leaders and would-be leaders had left the religions of their childhoods, as had Adler. The closest parallel was within the Unitarian ministry (see UNITARIAN UNIVERSALISM), and some came from it while others shifted into it.

What was emerging was a new form of religion, without rituals or creeds and operating with leaders rather than ministers. The sole commitment in this religion was to work for ethical change in society. Such change was the surest way to effect individual ethical growth. The rapid industrialization of the United States had left much of an earlier Protestantism in small towns, and had left cities populated with immigrants from oppressive coun-

tries abroad who were assimilating only slowly. Thus this was a time for social experimentation, however limited the scale. A "social gospel" was being explored in liberal Protestant circles, and a few Catholics were exploring what they termed an "Americanist" movement.

Although most members of Adler's supporting circles were economically well-off, their immigration memories kept them concerned about those less advantaged (some of their historians regarded this as noblesse oblige or even guilt)—but whatever the motivations alongside their ethical concerns, they were pioneers.

To serve poor children, the new society in 1877 created a District Nursing Department that set the pattern for visiting nursing movements. The first free kindergarten east of the Mississippi was created by Adler and the society a year later.

That same year a Workingman's School was created, extending the ethical concern to compensate for the limitations of the new public school movement. A women's group from the society turned to the study of child development and the "new psychology." Here was established a blend of academic education and practical skills that set the pattern for what would later be called "progressive" pedagogy and that was a forebear of PTA developments.

Another protégé, Stanton Coit, had discovered Adler's ideas while a student at Amherst. After sponsored study at Berlin and Columbia, he founded in 1886 the Neighborhood Guild in New York (later known as University Settlement). Patterned on London's Toynbee Hall, this was the first US settlement house. Here radical university students could live and work among "the masses," creating "the enlightenment of the people in social principles." Two years later, Jane ADDAMS founded Hull House in Chicago along similar lines of organizing and empowering the poor so that they could better control their own destinies.

Adler founded the Child Labor Society in 1904, and he and other society members were leaders in the development of the National Association for the Advancement of Colored People and the American Civil Liberties Union. Members played key roles in creating successful prison reforms, and as European turmoil brought refugees in the 1930s, members were in the forefront of resettlement efforts.

Adler never lost his vision that ethics depended upon education, and the experiments with schools that started with the children of the poor evolved into more integrated schools, both in class terms and in ethnic terms. In 1895 the original school was turned into the Ethical Culture School, with guaranteed scholarships for poor children and provision for "pay pupils."

In 1903 Anna Garlin Spencer, a Unitarian minister, joined as an associate leader. In 1908 she began directing a summer school in Madison, Wisconsin. Her work for women's rights, however, was not supported by Adler and she left in 1913 for an academic career.

By the 1920s the vision generated the Fieldston plan for a large school at Riverdale. What was needed was an alternative to the "mass schools" (public schools) and the "class schools" of the rich. John D. Rockefeller helped finance the venture, and V. T. Thayer was appointed director. The pragmatism of John DEWEY thereby entered Ethical Culture despite Adler's reservations.

In the 1940s Florence Klaber collaborated with the Unitarian Sophia Fahs to produce a new series of religious education materials for posttraditional schools. Students read various creation stories from around the world, for instance, climaxing the unit with views from modern science.

Adler held an appointment in Columbia University's philosophy department and taught an annual seminar. Over the years, many colleagues became involved with the society and were also involved in the academic training of leaders: among others, David Muzzey, John Herman Randall, Horace Friess, Herbert Schneider, and Joseph Blau. Leaders were also involved in creating a number of organizations, for example, Algernon Black with the Encampment for Citizenship and Jerome Nathanson with the Conference on Science and Democracy. These post-Adler leaders increasingly moved away from a Kantian idealism into a naturalistic instrumentalism reflecting Dewey's dominant role in American philosophy.

Leaders and members of societies might give varied responses to the question of whether Ethical Culture is a religion. In a recent Texas case, it was successfully argued that it deserved tax-exempt status on this basis. Perhaps more importantly, the movement has shown that a focus on ethics alone permits a very small number of persons to accomplish a great deal within their culture. The concentration of intellectual life in Manhattan has also helped, since the society is able to provide physical space and platform to many national causes.

Looking at the society today, it is clear that a majority of leaders would comfortably identify themselves as humanists who work within a postpatriarchal, transethnic, and postnationalistic worldview. On the international scene, they are well represented in the INTERNATIONAL HUMANIST AND ETHICAL UNION.

ROBERT B. TAPP

ETHICS AND UNBELIEF. Introduction. This article critiques the very idea of there being a cosmic underpinning for morality. I put my argument principally in Christian terms by explicating and critiquing the Thomistic tradition of natural moral law and the Protestant Reformationist tradition of divine command morality. But the reference to the Christian tradition is completely inessential. Similar points could be made for Judaism or Islam with inessential changes. Moreover, a secular humanist critique could also be mounted of the attempts to give a cosmic grounding for morality by the other great world religions and by the so-called primitive religions of other cultures, though in both cases the specifics, of course, would have to be different. But the main thrust would remain against the need for, and indeed the very possibility of, a coherent cosmological grounding for morality or of the very attempt by such means to give our lives significance.

I should add, however, that a secular humanist critique of attempts at a religious grounding for morality could also be made of the other great world religions, but there the arguments would not be so very similar to the ones I shall make here, though again the main thrust would remain against the need for and indeed the very possibility of a cosmic underpinning for morality.

I

Thomas Aquinas argues that all human beings have at least the potential to attain objective knowledge of good and evil. Moral knowledge, for him, does not rest on divine revelation nor need we simply assume on *faith* that the ordinances of God are good. We all have, Aquinas would have us believe, at least the capacity to know that there are certain fundamental things that we should avoid and certain fundamental things that we should seek.

If we will only note and then dwell on our most basic inclinations and the inclinations—the strivings and avoidings—of our fellow humans, we will come to know what is good. Good is thus said to be an objective concept, and it is somehow a part of the very nature of things. But it is not in physical nature that one finds what is good. As a neo-Thomist philosopher, Father C. B. Daly, puts it: "The Catholic moralists . . . do not pronounce morally right whatever nature does; do not equate statistical averages of subhuman physical events with the moral good." The good, the moral law that we can at least dimly apprehend, is to be discovered in our own human natures. As "physico-spiritual" beings we find the rule of right within.

If we stopped at just this empirical strand in Aquinas's thinking—a strand that Jacques Maritain likes to stress when he is talking about relativism—Aquinas's theory would be a variety of ethical NATURALISM and his theory would be beset with the standard difficulties facing ethical naturalism. "X is good" does not mean "I approve of X," "My culture approves of X," "People generally seek X," "Humans desire X," or "Normal humans seek X," for people may desire, approve of, or seek something that is bad. Indeed something could be widely approved of and still be evil. Most people at some time desire to commit adultery, but that people have this desire does not by that very act establish that adultery is good.

The fact is equally true that my culture's approval of something does not establish that it is a good thing to do. The Greeks of Plato and Aristotle's time (like people in many other cultures) approved of infanticide. That this is so is established by anthropological investigation, but this does not establish the truth of the moral statement "Infanticide is sometimes a good thing." What makes the anthropological statement true does not make the ethical statement true. Plato would not be contradicting himself if he said, "My culture approves of infanticide but infanticide is evil"; and I would not be *contradicting* myself if I said, "People generally disapprove of engaged couples sleeping together before they marry, but in reality there is nothing wrong with it." I might in some way be mistaken if I were to assert that there is nothing wrong with it, but in the present context that is beside the point. What is to the point is that I do not *contradict* myself, or say anything incoherent or conceptually out of order, in making that statement. We do not by that very act establish that something is good by discovering that I or others approve of it, like it, desire it, strive for it, seek it, and the like. A cross-cultural examination of what people desire is no doubt very important to a full understanding of what is good and what ends are worth seeking, but it is not enough to establish which ends are good or what ought to be. Even when people desire something, after careful reflection it does not follow that what they so desire is desirable. They might in various ways be mistaken about what they desire or their moral thinking might in some way be defective. If we stress only this empirical strand of natural law morality, we will encounter all of the traditional difficulties connected with ethical naturalism.

II

Aquinas's theory, it should be noted, is not simply an empirical theory. It has a metaphysical-theological strand as well. Father F. C. Copleston correctly remarks that we can only properly understand Aquinas's conception of the natural moral law if we place it against his doctrine of man as a creature of God in a rational purposive universe. If we secularize the natural moral law we are, according to Maritain and Father Peter Kossel, cutting out its very heart. All men, whether they know it or not, are, Aquinas believes, seeking union with God. The *summum bonum* is in God's very essence. In this life we cannot know what that essence is, but God, in his mercy, enables us to understand *something* of his goodness. All lesser goods on this account derive their goodness from God. Without God, life could have no meaning or value, indeed nothing

could have value, for in a godless world nothing could, in Aquinas's view, be genuinely good. God tells us what is good by giving us laws. Laws, for Aquinas, are "ordinances of reason" promulgated "for the common good, by him who has care of the community."

For Aquinas there are four basic kinds of law, though all laws must have the above-mentioned features. There is eternal law. This is God's blueprint for the universe. It is an expression of God's "divine subsisting reason." It springs from God; one of the ways it is promulgated is through divine law, which is that part of the eternal law that humans cannot grasp with their reason but is given to man by God through divine revelation. The natural law, by contrast, is that part of the eternal law that man can grasp by the use of his reason, if his natural inclinations have not been "corrupted by vicious habits" or "darkened by passions and habits of sin." The natural law is simply the specifically rational moral law in which rational beings conform their conduct to the eternal law.

In addition, there is what most people would ordinarily mean by *law*, namely, human law, which, according to Aquinas, must be a precept devised by human reason for the common good. The important thing to remember about Aquinas's conception of human law is that in order to be genuine human laws, the laws must *not* be incompatible with natural law. (Given this theory, one is committed to the paradoxical contention that what ordinarily would be called "an evil or vile law" is not a law at all.)

Natural law is the unwritten, and in its primary forms unalterable, law graspable by the reason of all normal adult human beings not corrupted by sin. It emanates from God's reason and is that part of his law knowable by human beings. There are, of course, different natural laws. There is the first primary (and what certainly seems to be the vacuous) first principle of the natural law. This primary precept—as it is called—is "Good is to be done and evil is to be avoided." There are other less fundamental but substantive secondary precepts of the natural law. "Life ought to be preserved," "Men ought to know the truth about God," and "Ignorance ought to be avoided" are examples of such natural moral laws.

While people can come to understand these natural laws through the use of their reason, it is important to understand, as Maritain in particular stresses, that man is not the measure of what are or are not natural laws. Man does not simply *resolve* to treat certain laws as crucial to his well-being and then correctly label them "natural laws." Rather he apprehends—though sometimes rather dimly—these unalterable natural laws. Human beings do not create them and they cannot alter them by their collective decisions. They are not always *self-evident to* an individual or even to a whole society, but they are indeed *self-evident in themselves*, serving as an absolute and unalterable foundation for correct moral decisions in our political, social, and personal lives.

III

The natural moral law has a long and varied history, and we understand very well the strong emotional support natural law conceptions have provided for many of the morally perplexed from the Greeks until the present. However, as emotionally comforting as these conceptions are, they do not constitute an adequate foundation for morality. I shall limit myself here to four general criticisms of the Thomistic conception of the natural moral law.

1. We are told that natural moral laws are self-evident, absolute, rational laws. They are certain and can be known without any doubt at all to be true. This sounds very reassuring, for it promises to give us the kind of objective knowledge of good and evil we desire. But there is here no genuine surcease from our perplexities about an objective justification of moral beliefs. It would be a mistake to believe that advocates of natural law are claiming that honest, nonevasive, intelligent reflection will necessarily make it clear to impartial and informed examiners that there are natural moral laws and that the laws generally claimed to be natural laws are indeed natural laws. Since the natural laws are only *self-evident in themselves* and not necessarily self-evident to us, what could it *mean* to say they are certain and that we can justifiably claim to be certain of them?

For such a certain knowledge of good and evil, we require moral principles that can be *seen* or somehow appreciated to be self-evident to us, or natural moral laws of whose truth we can be certain. But since natural moral laws are only self-evident *in themselves* (assuming we know what that means) and since it is God's reason and not man's that is the source of the moral law, we poor mortals can have no rational certitude that the precepts claimed to be natural laws are really natural laws. Beyond this it is surely a mistake to claim that laws or anything else are self-evident in themselves where it is impossible to know or have grounds for asserting that they are self-evident.

If a law or proposition p is such that we could never, even in principle, be in a position to justifiably claim that it either is or is not self-evident (since we mortals have and can have no grounds for claiming that it is self-evident), then it is senseless to assert or deny that p is self-evident in itself. If human beings can have no grounds for asserting that something is self-evident, they can have no grounds at all for asserting it is self-evident in itself. What we don't know we don't know is a significant tautology.

2. We find out what a human being *ought* to be, natural law theorists claim, by finding out what are the specific rational ways in which a person is to conform to the eternal law. We in turn find this out, by finding out what we are—by discovering our *essential nature*. As one natural law moralist put it, "Morality is man's knowledge that he ought to become what he is; that he ought to become a man by conduct becoming to a man."

In order to know how we humans should live and die, the natural law account goes, we must understand man's essential nature.

But to this it can be objected that, from the point of view of science, human beings have *no* essential human nature. We are not artifacts with an assigned function. It is both linguistically odd and cosmologically question begging to ask what human beings are for—assuming by this very question that a person is a divine artifact rather than a person in his own right. Science does not ask what humans are for; it does not know how to make such inquiry or even *what it is* to inquire into our essential nature. Science has no conception of this and philosophy has deconstructed it.

For the Thomist to speak of our essential nature requires the acquaintance and acceptance of the background assumption that a human being is a creature of God. But that human beings are creatures of God is not part of the corpus of any science. In fact, it is a completely unverifiable statement whose very *factual* intelligibility is seriously in question. But unless we can establish the factual significance of such an utterance, we have no grounds at all for saying we have, in the requisite sense, an essential nature. If we have no grounds for saying that human beings have an essential nature, then we have no grounds for claiming there are natural moral laws, at least as the Thomist tradition construes "natural laws."

3. The first principle of the natural moral law is a tautology (if you will, an empty truism) and is thus not a substantive moral proposition or principle. It is compatible with a completely relativistic or subjective view of morals, for it does not tell us what is good or what is evil, but it only makes explicit what is already implicit in the use of the words *good* and *evil*, namely, that if something is good it is, everything else being equal, to be sought; and if it is evil it is, everything else being equal, to be avoided. But it does not and cannot tell us *what* is to be sought and *what* is to be avoided.

To discover this we must turn to the substantive secondary precepts of the natural moral law. But some of these run afoul of the facts concerning cultural relativity, for some of them are not always assented to, much less are they always accepted as self-evident by all people. If we say (as Aquinas does) that all people whose natural inclinations are not "corrupted by vicious habits" and "darkened by passions and habits of sin" acknowledge these natural laws, we can ask in turn: Where do we get our criteria for deciding whose habits are vicious and sinful and whose are not? To rule out some natural inclinations as corrupt or sinful indicates that we are using a criterion in moral appraisal that is distinct from the natural law criterion of basing man's moral conceptions on his natural inclinations.

What actually happens is that those moral beliefs incompatible with Catholic doctrine (and as a result, called corrupt and sinful) are simply arbitrarily labeled *unnatural* and *abnormal*. But to do this is not to base morality squarely on natural law conceptions. We have here the application of moral criteria that are not based on natural law conceptions. Without such an application—an application drawn from religious doctrine and not from what we learn about human nature or from what we can derive from the first principle of the natural law—natural law conceptions could not overcome the cultural relativity they were designed to transcend.

If in defense of such natural-law conceptions it is replied, "We do not claim that all people and cultures always acknowledge these laws, but the crucial thing is that most of them do," we make another egregious error, for, if we argue in this way, we have presupposed that moral issues can be settled by statistics or by some cross-cultural poll. But Aquinas and his followers would surely not wish to say that moral issues are "vote issues." To argue that what most people value is valuable is to assume rather simple democratic standards, and by assuming them we again have a standard which is (a) *not* self-evident and which is (b) *independent* of the natural law. To avoid ethical relativism, the natural-law theorist must incorporate into his theory moral conceptions that are not based on the natural moral law and which are questionable in their own right.

4. Natural moral law theorists confuse talking about what is the case with talking about what ought to be the case. They confuse de jure statements with de facto statements. A statement about what normal people seek, strive for, or desire is a factual, nonnormative statement. From this statement or from any conjunction of such statements alone no normative (de jure) conclusions can be validly deduced except in such trivial cases as from "He wears black shoes" one can deduce "He wears black shoes or he ought to be a priest." But this simply follows from the conventions governing *or*.

Moreover, because the above compound sentence is a disjunction, it is not actually action-guiding; it is not actually normative. Moreover, to discover what our natural inclinations are is simply to discover a fact about ourselves; to discover what purposes we have is to discover another fact about ourselves, but that we ought to have these inclinations or purposes or that it is desirable that we have them does not follow from statements asserting that people have such and such inclinations or purposes. These statements could be true, but no moral or normative conclusions follow from them.

IV

Natural law theorists and religious moralists generally feel that without a belief in God and his moral order, an objective rational morality is impossible. This seems to me an utter mistake. The choice is not between NIHILISM and God.

Morality is a practical (that is, action-guiding, attitude-molding) rule-governed activity, whose central function it is to adjudicate the conflicting desires and interests of

everyone involved in some human conflict in an impartial and fair manner. In morality, we are most fundamentally concerned with the reasoned pursuit of what is in everyone's best interests. How do we decide what is in anyone's best interest, let along what are the best interests of everyone? In talking about a person's best interests we are talking about his or her most extensive welfare and well-being, and in talking about the best interests of everyone we are talking about the most extensive well-being possible for all in a given situation. This, of course, is not a pellucid notion, but it is also not the case that we cannot say anything reasonable about it. It is this, though not only this, that morality tries to further.

The concept of well-being is indeed vague, but it is not so vague that it is not evident that certain social practices could not be in our welfare. Drastically frustrating our normal needs for sleep, food, sex, drink, elimination, and the like could not be in our welfare. Moreover, it is not just these mundane matters that are a part of every conception of human well-being. Any way of life that denigrated personal affection, integrity, conscientiousness, knowledge, and the contemplation of beautiful things would be an impoverished way of life, for to stifle any of these things is to strike a blow at our very well-being. Similarly, a community could not be a community whose social practices served human welfare if those social practices pointlessly diminished self-respect, the appreciation and concern for others, creative employment, play and diversion. So while *welfare* and *well-being* are defeasible, context-dependent terms, they are *not* so vague as to not exclude at least some social systems both possible and actual—the Nazis, the Dobuans, or the Aztecs—as not furthering the welfare of all or even most of their members.

In morality we are concerned with the practical tasks of guiding conduct and altering behavior in such a way as to harmonize conflicting desires and interests so as to maximize to the greatest extent possible the welfare and well-being of each person involved. (One of the reasons why John Rawls's principles of justice as fairness are so important is that their stress is not just on maximizing well-being, or indeed maximizing welfare at all, but their stress is on a concern, as a crucial element of what it is to be fair, for the well-being of *everyone* alike.) We should judge our moral rules and social practices by this standard; and individual actions unambiguously governed by the moral practices that the agent or agents in question are so committed to are to be judged by whether or not they are in accordance with the moral practice in question. To act in accordance with them, when one sees that they are so related to such practices, is to act on principle: to act as a morally good person and not just as a person of good morals.

Using this general conception of the function of morality, or at least as a central function of morality, we can make appraisals of many practical issues. The natural law moralist can do this as well. But using my framework I can do it more reasonably and with greater objectivity and internal consistency that can advocates of the natural moral law. I can avoid the reified conceptions of the Thomistic conception of natural law.

V

I shall now illustrate how this is so by turning to some specific moral issues that often divide religious moralists and secular humanists. Consider the issue of miscegenation and the moral issues that have emerged around the use of contraceptives (see BIRTH CONTROL AND UNBELIEF). I could make similar points with reference to adultery, abortion, artificial insemination, same-sex marriage, and euthanasia; I pick these two issues because on the first I suspect that by now, between religious moralists and secularists, there is often practical agreement over what is right and what is wrong, while on the second there is no such agreement. By airing the respective grounds for making one claim rather than another, we can gain some idea of the differences—and, I hope, of the respective merits and deficiencies—of the contrasting orientations to morality.

Miscegenation is the mixture of races through marriage or other sexual contact. It was illegal in apartheid South Africa, and, until relatively recently, it was against the law in many southern states of the United States for whites and blacks to marry. Such a law and the moral attitude behind it is plainly immoral and should be strenuously opposed. But that is not the natural inclination or the considered judgment of everyone or even of the majority of people in all societies.

A natural law theorist might well argue that laws or rules forbidding marriage between people of different races is evil because it is contrary to the natural moral law. I think it would be difficult for him to make out such a case. It seems to me that it is, as a matter of fact, a quite natural inclination for many people. It is very natural for many human beings to make sharp and discriminatory distinctions between their own kind and those who have different pigmentation, physique, language, religion, or mores. It took a papal bull to make the conquistadors regard the Peruvian Indians as human beings with immortal souls. People who are very different from us are quite naturally (that is, typically) regarded with distrust and aversion. It seems to be natural for us to regard ourselves and our particular mores and physical traits as being intrinsically superior. We can only overcome these inclinations by a cosmopolitan education, including some *hard moral thinking*.

If, on the one hand, we turn to man's primitive, immediate, unrehearsed inclinations and strivings—the strivings and inclinations of "raw human nature"—we could hardly find a ground for the condemnation of the moral belief that there should be no mixture of the races. If, on the other hand, we take only the inclinations that withstand reflection and examination—careful moral and fac-

tual scrutiny—we have already imported into morality principles that are not simply derived from or based on human inclinations. Rather, we are speaking of considered judgments that would not be extinguished when they faced the tribunal of wide reflective equilibrium.

On the humanist view of morality we have, by contrast, a clear and unequivocal basis for opposing the belief that it is wrong for the races to intermarry. Biological and anthropological studies have made it abundantly clear that no one race is biologically inferior to another. They have also made it perfectly clear that no biological harm could come from such marriages. If anything, it might make for a certain hybrid vigor. But the serious point is that there are no rational grounds for being against intermarriage. This removes one supposed major impediment. Culturally speaking, it would cause distress to some people, but this distress has no basis in reason—in the use of our intelligence—and it could be slowly alleviated by proper education and time. This distress, in turn, is plainly outweighed by the continued feelings of inferiority or racial tension that such irrational and discriminatory laws engender. Similar things should be said about same-sex marriage. The gut feeling of many people that it is "unnatural" has no rational basis or biological warrant. Moreover, it runs against our deeply embedded principle of respect for human beings.

Moreover, it is not enough for morality to simply consider the welfare and well-being of the *majority*; it must consider the welfare and well-being of *everyone*. Sometimes, in tragic situations, an individual's interests must be sacrificed, but they can only be sacrificed on nonarbitrary grounds (say, in the protection of the interests of the vast majority of people in a war), but in miscegenation or same-sex unions nothing like this is even remotely at issue. What we have are prejudices, and nothing else, of a goodly number of people on the one hand, and the welfare and well-being of the people who love each other and wish to marry on the other. If people's prejudices are not catered to, their welfare is not being sacrificed, but rather the welfare of the people who wish to marry is being sacrificed by such laws and to such prejudices. Interests deserve protection but not prejudices, and the two are not the same.

Let us now consider the use of contraceptives as devices for birth control. I think contraceptives are something that people with normal sexual desires ought to use in many circumstances of their lives. The need and desire to make love is normal and natural. It should go without saying that it is one of the most intensely pleasurable experiences that we humans can have. When accompanied by deep affection and complete acceptance and understanding, it can help us to experience a feeling of oneness and union that is precious in a world where we human beings so often feel alienated and alone. These are precious and positive values of sex that have nothing to do with the reproductive function of intercourse, and there is no reason at all to inhibit their expression by forbidding all sexual activity not intended to function in the service of procreation.

The Roman Catholic version of the natural law position says that the use of artificial contraceptive methods is always wrong. It is unnatural, for in the words of Father Daly, it places an artificial substance between the lovers that obstructs the natural function of sex. It represents—we are told by Father Daly—both a psychological and a physical withdrawal, and hence is a variety of onanism. In his words: "Every contraceptive appliance or device is a 'hard wall of the ego' (or of two egos) refusing to be two-in-one-flesh."

This argument, if it can be so dignified, is utterly without merit. Few would deny that sexual experience without contraceptives was, until the age of the pill, usually a fuller, more enjoyable experience. But given modern oral contraceptives this very slight disadvantage of contraceptives completely disappears. And the positive values of contraception completely outweigh what is sometimes with some contraceptives their very slight disvalue. This is highlighted dramatically by the role of contraceptive devices such as condoms in AIDS prevention. The Catholic supposed "natural law" doctrine on this is deeply immoral.

More fundamentally still, if we are going to say "sexual intercourse under such circumstances is wrong because it is unnatural since it interrupts a natural function," we should also say that shaving, cutting one's toenails or hair, removing cancerous growths, wearing glasses, having an appendectomy, giving blood, or being circumcised (see Circumcision and Its Opposition as Causes) are also immoral because unnatural. Part of the human animal's glory and creativeness lies in the human ability to transform nature, including human nature, and not simply to be a frail reed completely at the mercy of one's animal ancestry. There are no good grounds at all for arguing that something is wrong because it is unnatural.

Further, it is the case that there are good reasons—urgently good reasons—for controlling population growth. Throughout the world approximately fifty thousand people die each day from malnutrition and other easily preventable disabilities. It *may* be that we are sufficiently inventive to prevent our world from becoming a "plundered planet" without the institution of artificial birth control techniques, but it is still a very grave risk to take, and overpopulation is at present causing severe misery in many parts of the world. It seems to me that a continued adherence to a dogmatic theology prevents us from adopting this humane and rational measure.

It is not only considerations of overpopulation that count in favor of the use of contraceptives, but also more personal considerations of human welfare and well-being. Where contraception is not practiced, children are frequently born to parents who do not want them or cannot really afford to have them. It is a deep and permanently wounding blow to a child who slowly realizes that he or she was not wanted. Mothers in families that do not

practice contraception frequently have children in too rapid succession. Their physical and psychological health is often badly shaken; they suffer, and as a result their children and husbands suffer as well. Lastly, for various financial or medical reasons, some couples cannot risk having children. Under these circumstances it is irrational and immoral to deny these couples the pleasure and sense of oneness they would gain from sexual union.

By their very creativeness human beings have distinguished themselves from other primates. We have the distinctive capacity for culture and the correlative ability to transform our environment rather than being subject to it. The Catholic "natural moral law" doctrine on contraception in effect overrides and denies this distinctive human gift. It would in effect make man subject to blind forces that he could otherwise rationally control. It is certainly not "unnatural" to seek not to be in bondage to them.

VI

It is not unnatural to ask: Given the Decalogue, why the natural law? Natural law moralists reply, "Because what the Decalogue commands us to do is also discoverable by reason and not everyone has heard the Word." Indeed, as the Father Victor White puts it, "A Christian cannot and will not judge the Decalogue in the light of natural law; but he will find in the Decalogue the divine approbation of the intrinsic, though limited, rightness of natural law." Attractive as this claim is, if my argument in the previous sections has been even near to being correct, we can see that such a Thomistic conception of the natural law is thoroughly mythical and cannot serve as a sound foundation for our moral beliefs. But we still have the Decalogue and, what is called by religious people, the revealed word of God. Let us now look at those radical reformationist, and in effect voluntaristic, claims that contend that this is all we *have* and all that we *need* to give significance and direction to our moral lives.

The distinguished Protestant theologian Emil Brunner argues that we cannot discover any sound abstract principles of right action or good conduct under which we could subsume particular moral claims that concretely direct us to do this or that. *Genuine human good is found only in the unconditional, unquestioned obedience of man to God.* Human conduct is good—that is, we are doing what we ought to be doing—only when God himself acts in it, through the Holy Spirit.

The religious person's obedience is not, Brunner would have us understand, obedience to a law or a principle "but only to the free sovereign will of God." The will of God cannot be summed up under any principle. We do not know what God is or what love is by apprehending a principle. We do not even understand these conceptions unless, quite concretely—existentially, if you will—"we learn to know God in His action, in faith." All ethical thought and moral understanding is rooted in such an existential knowledge of God; and "really good Christian conduct" needs to have the whole of the revealed existential Christian knowledge of God behind it. This *Deus Absconditus*, the God that we should love and fear, is manifested only in his revelation.

We, Brunner recognizes, indeed long for something that goes beyond revelation. We long for something we can rationalize, for something that can give us a rationally justifiable standard in accordance with which we can live, but, natural law theorists notwithstanding, *we human beings have no natural knowledge of good and evil.* We have not been able, for all our Faustian drives, for all our intelligence and knowledge, to seize the tree of knowledge of good and evil. The truth of the Jewish-Christian-Islamic claim that God is the "perfect good" and obedience to God's command is the sole desirable ultimate end of human action is not "a truth of reason" or a truth that is objectively verifiable or in any way objectively establishable. Only the person of *faith* can know or even understand it. But it nonetheless remains true that this Christian ethic has universal validity. As Brunner puts it:

> But this does not mean that the Christian ethic makes no claim to universal validity. Whatever God demands can be universal, that is, valid for all men, even if those who do not hear this demand do not admit this validity and indeed do not even understand the claim to universal validity. The believer alone clearly perceives that the Good, as it is recognized in faith, is the sole Good, and that all that is otherwise called good cannot lay claim to this title, at least not in the ultimate sense of the word. It is precisely faith and faith alone which knows this: that alone is good which God does; and indeed, faith really consists in the fact that man knows this—and that he alone can be known, namely, in the recognition of faith. But once man does know this he also knows the unlimited unconditional validity of this conception and of the divine demand.

Since we cannot rely on abstract principles, we can never, as the natural law tradition claims, know beforehand what God requires. Rather God commands, and whatever it is he commands we must obey. Therein lies our sole good, for "the Good is simply what God wills that we should do on the basis of a principle of love." It is indeed true that God wills our true happiness; but *he* wills it, and he wills it in such a way that no one else knows what his will is. If we try to stick to the use of our own reason and a sense of our own most fundamental inclinations or considered judgments, we will "never know what is right for us, nor what is the best for the other person." Here, as children of faith, we must simply

and humbly rely on God. Doing the right thing is simply obeying God's commands.

We go astray when we think that we can deduce our moral obligations "from some principle or another, or from some experience." This casuistry, this reasoning by cases and principles, Brunner contends, is legalistic thinking in the worst sense of that term. Our very conception of God and his divine love is distorted if we think that we can know what God ought to will for us in accordance with his love. What his love is, what he would judge to be for our own good, is too utterly far from us to allow us this judgment. "But of one thing we may be quite sure: his will is love, even when we do not understand it—when he commands as well as when he gives." But it is a complete mistake to think that we can take the measure of it by our ideas of love. God's love is beyond that.

Many people, including Kantians, have complained that a morally good man (as distinct from a man who is only a man of good morals) does what is good because it is good, not because of what he will get out of it or because he will be damned or punished if he doesn't. The truly moral person, Immanuel KANT argues, requires no such sanctions, no such pricks to his own intent. To require them is a perversion of moral endeavor. It is—in the Kantian phrase—to make morality *heteronymous*. We ought instead to do the good simply for the sake of the good.

Brunner rejects this Kantian approach. He argues that such a critique of the morality of divine commands fails to recognize "that the Good is done for the sake of the Good when it is done for the sake of God, in obedience to the Divine Command."

VII

Starkly contrasting with the traditional Thomistic conception of the natural moral law, we have in Brunner's exposition a powerful and classical expression of the morality of divine commands, a conception of morality that has been a central one in the Protestant tradition.

To start to look at it critically, let us first ask again this ancient question: "Is something good because God commands it or does God command it because it is good?" Let us consider the alternatives we can take here. If we say God commands it because it is good, this implies that something can be good *independently* of God. Why? Because "God commands it *because* it is good" implies that God apprehends it to be good or takes it to be good or in some way knows it to be good and then tells us to do it. But if God does this, then it is at least *logically* possible for us to see or in some way know or come to appreciate that it is good without God's telling us to do it or informing us that it is good—that is, without knowing anything of God.

This last point needs explanation and justification. The preceding clearly implies that good is not a creation of God—something is not *made* good by God's willing it—but rather is something apprehended by God or known by God. Since God apprehends something to be good, since it doesn't become good simply because he wills it or commands it, it is not unreasonable to believe that there can be this goodness even in a godless world. Translated into the concrete, this means that it would be correct to assert that even in a world without God, killing little children just for the fun of it is vile and caring for them is good.

Someone might grant that there is this *logical* independence of morality from religion, but still argue that, given human beings' corrupt and vicious nature (the "sin of the Old Adam"), they, as a matter of fact, need God's help to understand what is good and to know what they ought to do. Humans are pervasively sinful, and there is and always will be much corruption in the palace of justice.

Such a response is confused. With or without a belief in God we can recognize such corruption. In some concrete situations at least, we understand perfectly well what is good or what we ought to do. The "corruption" religious people have noted does not lie here. The corruption they are interested in comes not in our knowledge but in "our weakness of will." We find it in our inability to do what, in a "cool hour," we acknowledge to be good—"the good I would do that I do not." Religion—for some people at any rate—may be of value in putting their *hearts* into virtue. But that for some it is necessary in this way does not show us how it can provide us with a knowledge of good and evil by providing us with our ultimate standard of goodness.

Suppose we say instead—as Brunner surely would—that an action or attitude is right or good simply because God *wills* it or *commands* it. Its goodness arises from divine fiat. *God makes something good simply by commanding it.* (That is the course a consistent divine theorist should take. It goes well, as it did in the Middle Ages for William of Occam, with his voluntarism.)

Can *anything* be good or become good simply by being commanded or willed? Can a fiat, command, or ban create goodness or moral obligation? I do not think so. Suppose you are in a course and the professor tells you, "You must get a loose-leaf notebook for this class." His commanding it, his telling you to do it, does not by that very act make it something you *ought* to do or even make doing it good, though it might, given your circumstance, make it a prudent thing to do. But whether or not it is prudent for you to do it, given his position of authority, and your dependence on him, it is (if there are no reasons for getting that particular type of notebook or any notebook at all, other than those consequent on his telling you to do it) all the same a perfectly arbitrary injunction on his part and not something that could properly be said to be good or something morally speaking you ought to do. Commanding it doesn't make it either good or obligatory.

Suppose, to appeal to a similar consideration, a mother says to her college-age daughter, "You ought not

to go to class dressed like that." Her telling her daughter that does not by that very act make it a bad thing, and her ordering her daughter not to go to class dressed in a particular way doesn't make it the case that her daughter ought not to go to class dressed like that. For the mother to be right, she must be able to give reasons, and indeed arguably cogent reasons, for her judgment.

More generally speaking, the following are all perfectly intelligible: (1) He wills *y* but should I do it? (2) *X* commands it, but is it good? (3) *X* told me to do it, but all the same I ought not to do it. (4) *X* proclaimed it but all the same what he proclaimed is evil. Items (3) and (4) are not contradictions and (1) and (2) are not senseless, self-answering questions like: Is a wife a married woman? (Think here of G. E. Moore's open question arguments.) This clearly indicates that the moral concepts "should," "good," and "ought" are, in their actual use, not identified with the willing of something, the commanding, the proclaiming of something, or even with simply telling someone to do something. Even if moral utterances characteristically tell us to do something, not all "tellings to" are moral utterances or even things we otherwise should do. Among other things, "moral tellings to" are "tellings to" that must be supportable by *reasons* and for which it is always logically in order to ask for reasons. But this is not true for simple commands or imperatives. As a mere inspection of usage reveals, moral utterances are not identifiable with commands.

To this it will be replied: "It is true that these moral concepts cannot be identified with any old commands but *divine* commands make all the difference. It is *God's* willing it, *God's* telling us to do it, that makes it good." It is indeed true that, for the believer, it's being *God* who commands it, who wills it, that makes all the difference. This is so because believers assume that God is good. But now, it should be asked, how does the believer *know*, or indeed does he know, that God is good, except by what is in the end his own quite fallible moral judgment that God is good? Must he not appeal to his own considered judgments, his own moral sense here? Is there any escaping that?

It would seem not. We must, to know that God is good, see or come to appreciate that his acts, his revelation, his commands, are good. It is through the majesty and the goodness of his revelation in the scriptures that we come to understand that God is good, that God is the ultimate criterion for all our moral actions and attitudes. But this, of course, itself rests on our own capacity to make moral assessments. It presupposes our own ability to make moral judgments and to recognize or appreciate the difference between right and wrong. It is we who acknowledge, or fail to acknowledge, that God's commands must be obeyed. There is no escaping this relying on our own moral capacities—our own need to appreciate what we are to do here. Whatever we decide our need for decision—our own decision—is inescapable.

Furthermore, it can be denied that *all* the commands, all the attitudes exhibited in the Bible are of the highest moral quality. The behavior of Lot's daughters and the damnation of unbelievers are cases in point. But let us assume what in reality should not be so lightly assumed, that the moral insights revealed in our scriptures are of the very highest order and that through his acts God reveals his goodness to us. However, if believers so reason, they have by that very fact shown, by their own line of reasoning, that they think—inconsistently with what are taken to be God's own proclamations—that they have some knowledge of good and evil which has no logical dependence on its being willed by God.

We can see from the very structure of the argumentation here that we must use our own moral understanding to decide whether God's acts are good. We finally must judge the moral quality of the revelation; or, more accurately and less misleadingly, it is finally by what is no doubt fallible human understanding that we must judge that what *purports* to be revelation is *indeed* revelation. We must finally use our own moral understanding, if we are ever to know that God is good or, again more accurately, that there is a reality of such goodness that we should call that reality "God." Many believers do not think they think this way, but their very way of reasoning (their very use of discourse) reveals they are mistaken *about* their moral beliefs. (Our moral beliefs may be right while our beliefs *about* them—really metabeliefs—are mistaken.)

The believer should indeed concede that if we start to deliberate about the goodness of God, we cannot but end up saying something very similar to what I have just said. But our mistake, he could argue, is in ever starting this line of inquiry. Who are we to inquire into, to question, the goodness of God? That is utter blasphemy. No *genuine believer* thinks for one moment that we can question God's goodness. That was the mistake that Job made. That God is good, that indeed God is the Perfect Good, is *a given* for the believer. Given the believer's usage, it makes no sense to ask if what God commands is good or if God is good. Any being who was not good could not properly be called "God"; nor would we call anything that was not perfectly good God. A person who seriously queried, "Should I do what God ordains?" could not possibly be a believer. Indeed, Jews and Christians and Muslims do not mean by "He should do *X*" that "God ordains *X*"; and "One should do what God ordains" is not equivalent to "What God ordains God ordains." Still it is not only blasphemy; but it is, logically speaking, *senseless to question* the goodness of God.

Whence then, one might ask, the ancient problem of evil? But let us assume what it is reasonable to assume, namely, that in some way "God is good" and "God is the Perfect Good" are tautologies or "truths of reason." It still remains true that we can only come to know that anything is good or evil through our own moral insight. Let us see how this is so. First, it is important to see that "God is good" is not an identity statement: that is, "God" is not

equivalent to "good." "God spoke to Moses" makes sense. "Good spoke to Moses" is not even English. But not all tautologies are statements of identity. "Wives are women" and "Triangles are three-sided" are not statements of identity, but they are clear cases of tautologies. Perhaps it is reasonable to argue "God is good" has the same status, but, even if it does, we still must independently understand what is meant by *good* and the fundamental criterion of goodness remains *independent* of God.

As we could not apply the predicate *women* to wives if we did not first understand what women are and the predicate *three-sided* to triangles if we did not understanding what it was for something to be three-sided, so we could not apply the predicate *good* to God unless we already understood what it meant to say that something is good, and had some criterion of goodness. Furthermore we can and do meaningfully apply the predicate *good* to many things and attitudes that can be understood by a person who knows nothing of God. Even in a Godless world, to relieve suffering would still be good.

But is not "God is the Perfect Good" an identity statement? Do not *God* and *the Perfect Good* refer to the same thing? The meaning of both of these terms is so indefinite that it is hard to be sure, but it is plain enough that a believer cannot, while remaining a believer, question that "God is the Perfect Good." But granting that, we still must have a more fundamental criterion for good that is independent of religion, that is independent of a belief in God, for clearly we could not judge anything to be *perfectly* good unless we could judge that it was good, and we have already seen that our more basic criterion for goodness must be independent of God.

Someone might still say: "Look, something must have gone wrong somewhere. No believer thinks he or she can question or presume to *judge* God. A devoutly religious person simply must use God as his ultimate criterion for moral behavior. If God wills it, as a "knight of faith" one must just do it!

Surely this is in a way so, but it is perfectly compatible with everything I have said. "God" by *definition* is "a being worthy of worship," "wholly good," "a being upon whom we are completely dependent." These phrases partially define the God of Judaism, Christianity, and Islam. This being so, it makes no sense at all to speak of *judging* God or deciding that God is good or worthy of worship. But the crucial point here is this: Before we can make any judgment at all that any conceivable being, force, ground of being, transcendent reality, or what not could be *worthy* of worship, could be properly called "good" and even "the Perfect Good," we must have a logically prior understanding of goodness. That we could call anything or any foundation of anything "God" presupposes we have a moral understanding, an ability to discern what would be *worthy* of worship, perfectly good. Morality does not presuppose religion; religion presupposes morality. Ludwig FEUERBACH was at least partially right: Our very concept of God seems, in an essential part at least, a logical product of our moral categories.

In sum, then, we can say this: A radically reformationist ethic, divorcing itself from natural moral law conceptions, breaks down because something's being commanded cannot by that very act make something good. Jews, Christians, and Muslims think it can because they take God to be good and to be a being who always wills what is good. "God is good" no doubt has the status of a tautology in Christian thought, but if so, "God is good" still is not a statement of identity, and we must first understand what *good* means (including what criteria it has) before we can properly use "God is good" and "God is the perfect good." Finally we must judge concerning *any command* as to whether it ought to be obeyed; and we must use, whether we like it or not, our own moral insight and wisdom, defective though it undoubtedly is, to judge of *anything whatever whether* it is good, and finally as to whether anything could possibly be so perfectly good that it is *worthy* of worship.

If this be arrogance or hubris it is inescapable, for it is built into the logic of our language about God. We cannot base our morality on our conception of God. Rather, our very ability to have the concept of God we have presupposes a reasonably sophisticated and independent moral understanding on our part. Brunner, and the whole divine-command tradition, has the matter topsy-turvy.

VIII

Suppose someone argues, "It is a matter of faith with me that what God commands is what I ought to do; it is a matter of faith with me that God's willing it is my ultimate criterion for something's being good." Such a believer might say: "I see the force of your argument, but for me it remains a straight matter of faith that there can be no goodness without God. I do not *know* this is so; I cannot give *grounds* for believing that this is so; I simply humbly accept it on faith that something is good simply because God says that it is. I have no independent moral criterion."

Such believers surely exist. My answer to such fideists—to fix them with a label—is that in the very way they reason, in their very talk of God as the being *worthy* of worship, they show that in reality—their professions to the contrary notwithstanding—they *have* such an independent criterion. Their own generalizations *about* what they do notwithstanding, they show in their very behavior, including their linguistic behavior, that something's being willed or commanded does not by that very act make it good or make it something that they ought to do, but that its being willed by a being *they take to be* superlatively *worthy* of worship does make it good. But we should also note that it is by their own reflective decisions, by their own honest avowals, that they take some being or, if you will, some x to be so

worthy of worship and thus they show in their behavior that they do not even take anything to be properly designatable as "God" unless they have made a moral judgment about that being: that they take that being to be superlatively worthy of worship. Moreover, it is their own moral judgment and understanding that enables them to take it that anything could be worthy of worship. They *say* that on faith they take God as their ultimate criterion for good, but their actions speak louder than their words, and they show by them that *even their God is in part a product of their moral sensibilities.* Only if they had a moral awareness could they use the word *God*, as a Jew or a Christian or a Muslim uses it, so that, their protestations notwithstanding, they clearly have a criterion for good and evil that is *logically* independent of their belief in God. Their talk of faith will not alter that.

If the fideists reply: "Look, we take it on faith that your argument here or any argument here is wrong. We will not trust you or any philosopher or even our own reason against our Church. We take our stand here on faith and we won't listen to anyone." If they take their stand here, we must shift our argument. We can and should point out that they are acting like blind, fanatical irrationalists—like persons suffering from a *total* ideology.

Suppose they reply: "So what? Then we are irrationalists!" We can then point out the painful consequences to themselves and others of their irrationalism. We can point out that even if for some unknown reason they are right in their claim that one ought to accept a religious morality, they are mistaken in accepting it on such irrationalist grounds. The consequences of irrationalism are such that anything goes, and this, if really followed, would be disastrous for them and others. It is like the fascist idea of "thinking with your blood."

If they say "So what?" they do not care even about this. It seems that if we were to continue to reason with them, we would now have to, perhaps like a psychoanalytic sleuth, question their *motives* for responding in such a way. They can no longer have any reasons for their claims, and indeed they do not care about reasons. So argument, deliberation, or discussion with them is out of place, though we can inquire into what *makes* them take this absurd stance. We look for *causes* here that are not *reasons*. We are a step beyond where we can ask for reasons.

There is another objection that I need to consider briefly. Someone might say: "I'm not so sure about all these fancy semantical arguments of yours. I confess I do not know what to say about them, but one thing is certain: If there is a God, then he is the author, the creator, and the sustainer of everything. He created everything other than himself. Nothing else could exist without God, and in this fundamental way everything else is totally dependent on God. Without God there could be nothing to which moral principles or moral claims could be applied. Thus, in one important respect, morality, logic, and everything else is dependent on God, if such a reality exists."

I would first like to argue that there is a strict sense in which even this at least prima facie plausible claim of the religionist is not so. When we talk about what is morally good or morally right, we are not talking about what, except incidentally, *is* the case, but about what *ought* to be the case or about what *ought to exist*. Even if there was nothing at all—that is, if there were no objects, processes, relations, or sentient creatures—it would still be correct to say that *if* there were sentient creatures, a world in which there was less pain and suffering than the present world has would be a better world than a world like ours.

The truth of this is quite independent of the actual existence of either the world or of anything's existing, including God, though indeed we would, in reflecting on this possibility, still have to have an *idea* of what it would be like for there to be sentient life and thus a world. That its truth is independent obtains for the perfectly trivial reason that the "we" would denote a contingently empty class. Though no one could announce this truth, since if this hypothesis were true there would be no people, yet it still would be true that if there were a country like the United States and it had a president like President John F. Kennedy, then it would be wrong to have killed him. To talk about what exists is one thing, to talk about what is good or about what ought to exist is another. God could create the world, but he could not—that is, logically could not—create moral values. *Existence is one thing; value is another.*

If all this arcane argument of what ought to be as being something independent of what is strikes you as stuff of too heady a nature, consider this independent and supplementary argument against the theist's reply. To assert that nothing would be good or bad, right or wrong, if nothing existed is not to deny that we can come to understand, without reference to God, that it was wrong to kill Kennedy and that religious tolerance is a good thing. The religious moralist has not shown that such killing would not be good even if the atheist were right and God did not exist. But the religious person must show that in a godless world morality and moral values would be impossible if his or her position is to be made out. If there is no reason to believe that torturing little children would cease to be evil in a godless world, we have no reason to believe that, in any important sense, morality is dependent on religion.

We can see that we have independent criteria for what is right and wrong or good and bad. God or no God, religion or no religion, it is still evil pointlessly to inflict pain on helpless infants. This, of course, is an extreme case, but it makes vivid how our moral categories are not religion dependent. In more mundane situations this is also plainly the case. In a godless world, the practice of promise keeping would still have a rational point.

IX

There is still a further stage in the dialectic of the argument about religion and ethics. I have shown, if my arguments have been on the mark, that in a purely logical sense fundamental moral notions cannot rest on the doctrinal claims of religion. In fact, quite the reverse is the case, namely, that only if we have a religiously independent concept of good and evil can we even have the Jewish-Christian-Islamic conception of deity. In this very fundamental sense, it is not morality that rests on religion, but religion that rests on morality. Note that this argument could be made out even if we grant theists their metaphysical claims about what there is. That is to say, the claims I have hitherto made are quite independent of skeptical arguments about the reliability or even the intelligibility of claims to the effect that God exists.

Some defenders of the faith will grant that there is indeed such a fundamental claim, as independent of ethical belief as it is from religious belief, though very few, if any, would accept my last argument about the dependence of religious belief on human moral understanding. They could accept my basic claim and still argue that to develop a *fully human* and *adequate normative* ethic one must make it a religious ethic. Here, in the arguments for and against, the intellectual reliability of religious claims will become relevant.

The claim that such a religious person wishes to make is that only with a God-centered morality could we get a morality that would be adequate, that would go beyond the relativities and formalisms of a nonreligious ethic. Only a God-centered, and perhaps only a Christ-centered, morality could meet our most persistent moral demands. Human beings have certain desires and needs; they experience loneliness and despair; they create certain "images of excellence"; they seek happiness and love. If the human animal were not like this, if we were not this searching, anxiety-ridden creature with a thirst for happiness and with strong desires and aversions, there would be no good and evil, no morality at all. In short, our moralities are relative to our human nature. And, given the human nature that we in fact have, we cannot be satisfied with any purely secular ethic. We thirst for a divine father who will protect us, who will not let life be just one damn thing after another until we die and rot. We long for a God who can offer us the promise of a blissful everlasting life with him. We need to love and obey such a Father. Unless we can picture ourselves as creatures created by such a loving sovereign, and convince ourselves of the truth of our picture, our deepest moral expectations will be frustrated.

No purely secular ethic can offer such a hope. Whatever the irrationality of such a faith, our very human nature, the claim goes, makes us long for such assurances. Without it, many feel that their lives will be without significance, without moral sense; morality finds its *psychologically* realistic foundation in certain human purposes; a human life without God will be devoid of everything but trivial purposes. Thus without a belief in God, there could be no humanly satisfying morality. On this view SECULAR HUMANISM is in reality inhuman.

It is true that a secular morality can offer no hope for a blissful immortality (see IMMORTALITY, UNBELIEF IN); it is also true that secular morality does not provide for a protecting, loving father or some overarching purpose to life. But we have to balance this off against the fact that these religious concepts are myths. We human beings are helpless, utterly dependent creatures for years and years. Because of this there develops at least in many of us a deep psychological need for an all-protecting father or, depending on what culture we are in, some other cosmic assurances. It is natural enough for human beings to thirst for such security. But there *is* not the slightest reason to think that there is such security. That we have *feelings* of dependence does not mean that there is something, particularly some transcendent something, on which we can depend.

Furthermore, and more importantly, if there is no such architectonic purpose *to* life this does not at all mean there is no purpose *in* life—that there is no way of living that is ultimately satisfying and significant. It indeed appears to be true that all small purposes, if pursued too relentlessly and exclusively, leave us with a sense of emptiness. Even Mozart listened to endlessly becomes boring, but a varied life lived with verve and with a variety of conscious aims can survive the destruction of Valhalla.

We do not need a God to give meaning to our lives by making us creatures of his sovereign freedom. We, by our deliberate acts and commitments, our reflective endorsements, give meaning to our own lives. Here we have that "dreadful freedom" that yields human dignity; freedom will indeed bring anxiety, but we will be the *rider* and not the *ridden*, and by being able to choose, seek out, and sometimes realize the things we most deeply prize and admire, our lives will take on significance. A life lived without purpose is indeed a most dreadful life, but we do not need God or the gods to give purpose to our lives. We, without God, have many things we would do or be.

There are believers who would say that these purely human purposes, forged in freedom and anguish, are not sufficient to meet our deepest moral needs. We need very much to see ourselves as creatures with a purpose in a divinely ordered universe. We need to find some cosmic significance for our ideals and commitments; we want the protection and the certainty of having a function. As Dostoyevsky's Grand Inquisitor realized, and as some religionists argue, this is even more desirable than our freedom. We want and need to live and be guided by the *utterly sovereign will of God*. If that entails a sacrifice of our autonomy, so be it.

If religious moralists really want this and would continue to want it on careful reflection, after all the consequences of this view and the alternatives had been placed

vividly before them, we *may* with them finally get back to an ultimate *disagreement in attitude*. But before we get there, there is a good bit that can be said. How could their purposes really be *their* own purposes, if they were creatures made for God's sovereign purpose and under the sovereign will of God? Their ends would not be something they had deliberately chosen, but would simply be something that they could not help realizing. Moreover, is it really compatible with human dignity to be *made for* something? To ask, "What are you *for*?" is an insult! Finally, is it not infantile to go on looking for some father, some order, that will lift all the burden of decision from you? Some children follow rules blindly, but do we want to be children all our lives?

It is hardly arrogance on our part to want a world where we can make our own decisions and live as we reflectively want in ways that do not harm others. We will want to follow the rules and have the practices we do, not simply because we have been enculturated into them, but because we see and accept their point. We want to have moral norms where we do not have to crucify our intellects in trying to belief these norms answer to some transcendent rationale whose very intelligibility is seriously in question. To charge secular humanists with hubris here is symptomatic of a dying religion suffering a failure of nerve in a world which in Max Weber's conception is becoming progressively disenchanted. The present task is not only to continue disenchanting and demystifying, but also to struggle to make our world a place that we would like to live in: that would answer to what we reflectively and nonevasively find desirable. Religion cannot achieve that for us, but as long as we by our own collective actions do not achieve it for ourselves, there will arise from the conditions of our social life pitiful phenomena like that of the Moral Majority or Christian Evangelicals for Bush.

EUGENICS. The term *eugenics* was originally coined by Francis Galton in 1893, under the influence of Charles DARWIN's work *The Origin of Species*. The word *eugenics* was intended to refer to attempts to improve the condition of the human race by means of what we would now call genetic policies. The term *genetics* itself was introduced only in 1905 by William Bateson to provide a name for the science of heredity, the study of how like normally begets like.

In the last quarter of the nineteenth century, a number of biological and social scientists came to believe that the quality of the populations of the Western nations was deteriorating. They thought this was happening because of a relaxation of natural selection, the process by which in every generation the unfit tend to be eliminated by the reduction of their fertility and/or by their relatively early deaths. They had in mind improvements in medicine and sanitation, and adaptive devices such as eyeglasses. Once natural selection becomes relaxed by such means, they argued, genetic deterioration becomes inevitable. They therefore concluded that this process of degeneration had already begun.

Some of these practically minded Victorians therefore began to ask themselves what could be done to counter such genetic degeneration. The obvious solution was to replace natural selection by a deliberately designed artificial selection by which human societies would become able to control and improve their own genetic quality. Such genetic policies would be of two kinds: positive, attempting to promote the birth of children to, and the raising of children by, parents perceived to be of a superior kind; and negative, attempting to prevent the birth to, and the raising of children by, parents perceived to be of an inferior kind.

Galton himself tried to promote positive eugenics in two ways. One was by establishing local eugenics associations to promote eugenic principles in their localities. The other was by trying to identify those families in those localities that had, by virtue of their qualities of health, ability, and character, made valuable social contributions over several generations, and to make them aware of their duty to have children, and thereby to increase, or at least maintain, their numbers in future generations. Galton's final contribution to this campaign was to announce, in a lecture to the Sociological Society at the London School of Economics in 1905, that he was funding a research fellowship at University College, London to undertake the task of compiling pedigrees of elite families. This

research was then begun by Edgar Schuster. The first volume, which dealt with the pedigrees of eminent British scientists, was published in the following year.

Galton's negative eugenics was directed at curtailing the fertility of so-called undesirables. This social group roughly corresponds to what much later became known as the underclass. Subsequent debates might have been less politically confused had the word *set* been used here instead of the word *class*. (By Cantor's Axiom for Sets, the sole essential feature of a set is that its members have at least one common characteristic, any kind of characteristic.)

Galton had read and digested the American sociologist Richard Dugdale's account of the degenerate Jukes family, which had produced seven generations of criminals, alcoholics, unemployables, and prostitutes. That account was the first detailed study of what was later to be called "the intergenerational cycle of transmitted deprivation." Such families, Galton believed, were not confined to the United States. England too was "overstocked and overburdened by the listless and incapable." He considered that such persons "are exceptionally and unquestionably unfit to contribute offspring to the nation." He "believed that stern compulsion ought to be exerted to prevent the free propagation of stock of those who are seriously afflicted by lunacy, feeble-mindedness, habitual criminality, and pauperism." Galton himself was confident that democracies would ultimately refuse consent to that liberty of propagating that was then allowed to the undesirable classes.

Although the twentieth century is now some years behind us, British democracy has not yet shown any sign of justifying Galton's confidence. But well before the end of that century, sterilization laws had been adopted in several other countries. By 1913 such laws had been adopted by twelve US states, and by 1931 by thirty; these laws were implemented on a substantial scale. It was, for instance, estimated by Ludmerer that by 1935 about twenty thousand sterilizations had been performed in the United States, and that by 1970 this figure had risen to about sixty thousand, of whom about half were mentally retarded and half were both mentally retarded and criminal. From the early 1970s some sterilizations continued to be performed in the United States, but the number was greatly reduced as the result of legal challenges, changes in public sentiment, and pressure by civil liberties organizations.

Sterilization laws similar to those in the United States were introduced in 1920 in the Canadian province of Alberta, in Denmark, and in Switzerland; in 1933 in Germany; in 1934 in Norway and Sweden; and in 1935 in Finland. In 1977 it emerged that approximately 60,000 people had been sterilized in Sweden between 1934 and 1976, the year during which the sterilization law was repealed. That amounts to roughly the same proportion of the population as was sterilized in Nazi Germany between 1933 and 1939. Eugenic sterilization was introduced in Japan in 1948, allowing doctors to sterilize those with gross mental or physical handicaps without their consent. It is estimated that 16,520 Japanese women were compulsorily sterilized between 1949 and 1995. The Japanese Sterilization Law was repealed in 1996.

Although the intellectual firepower exercised in support of eugenics in the United Kingdom seems to have been greater than that exercised in any other nation state, its actual effect on state policy has been negligible. Before the end of the nineteenth century the social philosopher Herbert SPENCER and the Fabian socialist Sidney Webb declared their support for Galton's views. Webb did research in the 1890s that showed "the improvident" had above-average numbers of children, and he wrote of the high fertility of the "degenerate hordes of a demoralized residuum." The leading exponent of eugenics in that pre–World War I period was Karl Pearson, a professor of applied mathematics at University College, London now mainly remembered for working out the statistical method of the Pearson correlation coefficient.

Until roughly two-thirds of the way through the twentieth century, eugenics continued to command the support of many, if not most, professional biologists. Thus Julian HUXLEY (grandson of the Thomas Henry HUXLEY, who became known as Darwin's bulldog, and brother of Aldous Huxley, who described a eugenic state in his novel *Brave New World*), who himself became the first director general of UNESCO, was always a member of the British Eugenics Society, was its president for the period between 1949 and 1968, and gave its annual Galton Lecture in 1936 and 1962.

But in the 1960s support for eugenics began to decline. All over the world eugenics societies put themselves into voluntary liquidation. A crucial year was 1969, when the American Eugenics Society ended publication of its journal *Eugenics Quarterly* and replaced it with *Social Biology*, and the British Eugenics Society ended publication of the *Eugenics Review* and replaced it with the *Journal of Biological Science*. In 1972 the American Eugenics Society changed its name to the Society for the Study of Social Biology. In 1974 the president of the new society explained that "[t]he society was groping for a wholly new definition of purpose. It was no longer thinking in terms of 'superior' individuals, 'superior' family stocks or even of social conditions that would bring about a 'better' distribution of births. It was thinking in terms of *diversity*" (italics added).

In France the Nobel Prize–winning physician and eugenicist Alexis Carrell had been honored by the medical faculty at the University of Lyons being named after him; streets were also named after him in Bordeaux, Strasbourg, and several other cities. In the 1970s and 1980s Carrell's name was removed from the Lyons medical faculty and from the streets.

In the United States, three people, Mark Haller, Kenneth Ludmerer, and Daniel Kevles, published polemical and abusive histories of the eugenics movement. Extracts from the third of these were serialized in the

New Yorker, while the *New York Times Book Review* described it as "a revealing study by a distinguished historian of science." For an alternative and better-informed view of this work of Kevles see pp. 15–17 of the first chapter of Richard Lynn's scholarly *Dysgenics: Genetic Deterioration in Modern Populations* (Westport, CT: Praeger, 1996).

ANTONY FLEW

EUPRAXSOPHY. The term *eupraxophy*, later modified to *eupraxsophy*, was introduced to characterize a way of life different from either religion or philosophy. It applies especially to SECULAR HUMANISM, which combines a method of inquiry, a cosmic worldview, a life stance, and a set of social values.

Fundamentalist religionists have attacked secular humanism as a "religion," which it is not. There has been no word in the English language adequate to describe secular humanism fully (though see LIFE STANCE). The Dutch, for example, have the word *levensbeschouwing*, which can be translated as "reflection on, consideration of, or view of life." Dutch also has the adjective *levensovertuiging*, which is stronger than *levensbeschouwing* because *overtuiging* means "conviction." Thus there are no religious overtones. *Religion* in Dutch is *godsdienst*, which means "service to God." English has no such terminology.

The term *eupraxsophy* is a term that can be used in many languages. Literally, *eupraxsophy* means "good practical wisdom." It is derived from the following Greek roots: *e*, *praxis*, and *-sophia*. *E* is a prefix that means "good," "well," "advantageous." It is combined in words such as *eudaimonia*, which means "well-being" or "happiness"; it is also used in *eulogy* (good speaking, as of the dead), *euphoria* (good feeling), *euthanasia* (good death), and so on. *Praxis* refers to "action, doing, or practice." *Eupraxia* means "right action" or "good conduct." The suffix *-sophia* is derived from *sophos* ("wise") and means "wisdom." This suffix appears in the term *philosophy*, combining *philos* ("loving") and *-sophia* ("wisdom") to mean "love of wisdom."

In its original sense, philosophy—as metaphysics or "the science of being"—investigated the general principles and categories by which we can understand nature and interpret reality. The classical philosophers attempted to work out a system of nature in which certain principles were considered to be basic. Metaphysics has suffered considerable disrepute in modern times, particularly at the hands of skeptical critics. At the very least, metaphysics analyzes and interprets the basic concepts of the sciences, attempts to make some sense out of them, and, if possible, to unify them. This is a very complex task today because of the continuing proliferation of new disciplines and fields of learning, and the enormous difficulty for any single mind to be able to master the expanding corpus of knowledge.

Philosophical inquiry also focuses on epistemology, the theory of knowledge. It is concerned with questions of meaning and truth and with the principles of valid inference: inductive and deductive logic. There are many other branches of philosophy, including logic, aesthetics, ethics, the philosophy of science, political and social philosophy, and the philosophy of religion; indeed, almost any field can be approached philosophically.

Synthetic philosophy attempts to offer universal or general principles and to develop an overall view, a cosmic perspective or *Weltanschauung*. This is sometimes called synoptic or speculative philosophy, but since the development of modern science in the sixteenth and seventeenth centuries, this approach has been seriously questioned on methodological grounds, for it cannot be done independently of science but only in relation to it. Nonetheless, philosophy, in this sense, is thinking about generalities; it is concerned with root questions and cosmic coherence. Analytic and critical philosophy, on the other hand, are far more modest in scope. Analytic philosophy is concerned with understanding the nature of meaning and truth, and in defining and analyzing the key concepts within any particular field of inquiry. Critical philosophy is evaluative; it strives for clarity, but it also seeks to appraise the validity of truth claims.

These activities are primarily intellectual in purpose, and they are neutral in regard to their practical consequences. The Greeks distinguished contemplative from practical wisdom. Philosophy, as the love of wisdom, begins primarily in the theoretical or contemplative mode. There is another branch of normative philosophy, however, that strives for practical wisdom in ethics and politics. Here, classical philosophy sought to provide some guidance for the good life and the just society. ARISTOTLE maintained in the *Nicomachean Ethics* that ethics has practical import and that we should study it in order to live well. He held that the development of character and virtue and the exercise of practical wisdom would contribute to the achievement of happiness. Many ethical philosophers, however, have focused primarily on the meta-analysis of concepts such as "good," "bad," "virtue," "value," "justice," and so on. This was expanded in latter-day Kantian philosophy (see KANT, IMMANUEL) to the definitions of "right," "wrong," "obligation," "responsibility," and the like. Whether or not these terms can be defined has been hotly debated down to the present; objectivists believe that they can be defined, but there is a skeptical tradition (see SKEPTICISM) that denies their definability. Be that as it may, classical ethics always had a normative purpose.

A basic distinction can be made between customary morality (see MORALITY FROM A HUMANIST POSITION), which refers to the moral conceptions that already prevail in a given cultural group, and *ethics*, which involves a reflective and critical component (see ETHICS AND UNBELIEF). Today, many philosophers concerned with

ethics emphasize the need for ethical rationality—but virtually for its own sake; and many eschew making any concrete recommendations beyond this in dealing with problems that arise in customary morality. This is particularly true in universities and colleges, where philosophy is taught as an academic discipline, where philosophers do philosophical research and publish their disquisitions in scholarly journals, and where philosophy teachers have no clearly identifiable positions. They consider their primary pedagogical method to be the presentation of alternative philosophical theories and do not attempt to inculcate a set of beliefs or values; that is, they do not seek to persuade their students or the general public to accept their philosophical outlook. Since their task is pure inquiry, similar to that of other disciplines, such as history and the natural and social sciences, they can safely retreat into splendid isolation in an ivory tower—being philosophers qua philosophers—without any need to vindicate their personal positions. The virtue of this form of philosophy is that the professor imparts a love of wisdom and the skills of critical thinking without imposing his or her own biases on the student. The professor does not wish to indoctrinate or propagandize for a particular cosmic outlook. He or she wants to be objective, or may even fear reprisals from those who support the conventional wisdom of the day. Yet this kind of philosophy does not satisfy the deeper queries either of students, or of ordinary men and women. It presents no worldview; it does not defend a theory of meaning and truth; nor does it seek to persuade others of the comparative reasonableness of the philosopher's own considered normative or social ideology. Philosophy, as the love of wisdom, aside from being committed to fair-minded and objective critical analysis, most often is *neutral*. It can take no position; it can draw no normative conclusions from its formal analyses. It is largely a cognitive enterprise; it involves no attitudinal or emotive component. Nor does it seek to arouse conviction or inspire commitment.

How far this form of philosophy has come from the original Socratic vision of the good life! For SOCRATES, philosophy had direct relevance to how we should live. The unexamined life is not worth living, he averred, and he was even willing to die for his convictions. Baruch SPINOZA's *Ethics* seems to have expressed both a philosophy and a eupraxsophy, at least implicitly. We might even say that many or most philosophical systems implicitly had a pragmatic function and that their task was to provide an alternative to religion and a guide to ethics and politics. Contemplative wisdom was often a mask for deeper utilitarian purposes. Karl MARX clearly marked a break with the contemplative mode of philosophy, particularly when he said that the task of philosophy was not simply to interpret the world but to change it! Philosophy in this sense has momentous significance—as it did for Jeremy BENTHAM, John Stuart MILL, Friedrich NIETZSCHE, Arthur SCHOPENHAUER, Bertrand RUSSELL, Jean-Paul SARTRE, John DEWEY, Sidney HOOK, and others. Thus many philosophers historically played analogous roles. Alas, philosophy today has all too often become wedded to the academy or corrupted by narrow specialization. Philosophy has lost out to religion and ideology, which in competition for the "souls" of men and women now rule the day.

Eupraxsophy differs from antiseptically neutral philosophy in that it enters consciously and forthrightly into the arena where ideas contend. It takes new directions and seeks to carve out a new approach. Unlike pure philosophy, it is not simply the love of wisdom, though this is surely implied by it, but also the *practice* of wisdom. This does not mean that ethicists should not be interested in developing the capacity for critical ethical judgment. That is an eminently worthwhile goal. But eupraxsophy goes further than that, for it provides a coherent, ethical life stance. Moreover, it presents a cosmic theory of reality that seems reasonable at a particular point in history in the light of the best knowledge of the day. Secular humanist eupraxsophy defends a set of criteria governing the testing of truth claims. It also advocates an ethical posture. Also it is committed, implicitly or explicitly, to a set of sociopolitical ideals. Eupraxsophy combines both a *Weltanschauung* and a philosophy of living. But it takes us one step further by means of commitment; based upon cognition, it is fused with passion. It involves the application of wisdom to the conduct of life.

Analytic and formalistic philosophies are unwilling to affirm this conviction. They examine all sides of a question, see the limits and pitfalls of each, but are unwilling to take a stand on any. This has some merit; the open mind must recognize that it may be mistaken and that views may have to be modified in the light of new arguments or evidence. For the *eupraxsopher*, a skeptical attitude is essential—but not at the price of forfeiting all convictions (see SKEPTICISM). The eupraxsopher does make choices—the most reasonable ones in light of the available evidence—and this enables him or her to act. After all, theologians, politicians, generals, engineers, businessmen, lawyers, doctors, artists, poets, and plain men and women have beliefs, and they act. Why deny this right to the informed philosopher-eupraxsopher? For the eupraxsopher, one's beliefs should be based upon reason, critical intelligence, and wisdom. This is what the suffix *-sophy* refers to. Wisdom in the broad sense includes not only philosophical and practical judgment, but also *scientific understanding*.

Merriam-Webster's Collegiate Dictionary defines *-sophia* or wisdom as follows: "1. The quality of being wise; ability to judge soundly and deal sagaciously with facts, especially as they relate to life and conduct; knowledge, with the capacity to make due use of it; perception of the best ends and the best means; discernment and judgment; discretion; sagacity. 2. Scientific or philosophical knowledge."

Explicit in this definition is a *scientific* component, for

wisdom includes the best scientific knowledge drawn from research and scholarship in the various fields of inquiry. Unfortunately, expert practitioners in the various scientific specialties often feel qualified to judge only matters within their own areas of competence, failing to engage the broader questions that have direct bearing on life. There is a crisis in modern science, for the specialties are growing exponentially, with many specialists feeling that they can talk only to those within their own disciplines. Science thus has become fragmented. Who is able to cross the boundary lines and draw meta-inferences about nature, the human species, society, or life in general? The eupraxsopher deems it his mission to do so. E. O. Wilson characterizes the goal of this enterprise as *consilience*, an attempt to interpret and integrate scientific knowledge across many disciplines.

Theoretical scientific research is morally neutral. The scientist is interested in developing causal hypotheses and theories that can be verified by the evidence. Scientists describe or explain how the subject under study behaves without evaluating it normatively. There is, of course, a pragmatic element to science, particularly the applied sciences; for we constantly seek to apply our scientific know-how to practical technology. Moreover, scientists presuppose epistemological criteria that govern their process of inquiry. They are committed to a set of values including truth, clarity, consistency, rationality, and objectivity. But scientists qua scientists do not go beyond that, and restrict themselves in the quest for knowledge to their specialized domain of inquiry.

Secular humanist eupraxsophy, on the other hand, attempts to draw the philosophical implications of science to the life of human beings. It seeks to develop a cosmic perspective, based on the most reliable findings encountered on the frontiers of science. It recognizes the gaps in knowledge and the things we do not know that still need to be investigated. It is keenly aware of the need for fallibilism and AGNOSTICISM about what we do and do not know. Yet it boldly applies practical scientific wisdom to life.

Eupraxsophy, unlike philosophy or science, does not focus on one specialized field of knowledge; it seeks to understand the total impact of scientific knowledge on a person's life. Yet the areas of philosophy, science, and eupraxsophy are not rigid. Philosophers can assist scientists in interpreting their discoveries and relating them to other fields of inquiry, and in developing a broader point of view. Still, eupraxsophy moves beyond philosophy and science in seeking to present a coherent, naturalistic life view as the basis on which we are willing to act. It is the ground upon which we stand, the ultimate outlook that controls our view of reality.

Accordingly, the primary task of eupraxsophy is to understand nature and life and to draw concrete normative prescriptions from this knowledge. Eupraxsophy thus draws deeply from the wells of philosophy, ethics, and science. It involves at least a double focus: a cosmic perspective and a set of normative ideals by which we may live.

PAUL KURTZ

EURIPIDES (485?–406 BCE), Greek playwright. Of the ninety plays Euripides is believed to have written, nineteen have come down to us—a far higher proportion than that of any other Greek playwright, but nevertheless a partial and perhaps unrepresentative selection.

Even in antiquity, Euripides developed a reputation for ATHEISM. The comic playwright Aristophanes has one of his characters remark: "But now that man [Euripides] by his tragic poetry has persuaded men that there are no gods at all." The classical scholar A. W. Verrall made Euripides' atheism the focus of his study *Euripides the Rationalist* (1913); but, granting that our knowledge of Euripides' work is imperfect (and granting further that, as with any playwright or novelist, it is highly problematic to attribute any given character's utterances to the author himself), it is the consensus of modern scholars that Euripides, while expressing skepticism and even scorn of the Greek pantheon and of the miraculous stories attributed to the gods, was not what one would today call an atheist.

The evidence for Euripides' religious skepticism is not easily interpretable. One fragment seems clear on the matter: "Who is it, anyway, that says the gods exist in starry heaven?/ They don't. They don't exist at all./Anyone still willing to talk in that old-fashioned way is a moron." But it is not clear how this utterance fits into the drama of which it is a part. Another fragment is less ambiguous: "If the gods do evil, they are not gods." This, in effect, is the thrust of Euripides' surviving play *Herakles*, in which the hero Herakles (believed to be the son of Zeus and a mortal, Alcmene) is maddened by Hera and kills his own

wife and children. Theseus, attempting to console Herakles after his madness has subsided and he is consumed with guilt for his actions, notes that even the gods commit adultery and other acts that would be branded as sinful. To this Herakles replies: "I don't believe gods tolerate unlawful love./ Those tales of chainings are unworthy; I never did/And never will accept them; nor that any god/Is tyrant of another. A god, if truly god,/Needs nothing. Those are poets' lamentable myths." The remarkable statement "[a] god . . . needs nothing," while probably derived from XENOPHANES, constitutes a radical repudiation of the basis of Greek religion, in which the gods were believed to be pleased with the animal sacrifices and other rituals that mortals made in their honor; it is also a striking anticipation of the theology of EPICURUS.

It would seem that Euripides, a generation younger than Aeschylus and a younger contemporary of Sophocles, and writing in the full flower of the radical skepticism engendered by the Sophists, was evolving a theology that repudiated the scandalous legends pertaining to the Greek gods as well as the notion, found in such writers as Hesiod, Pindar, and Aeschylus, that the gods were both powerful and just. Euripides has several characters express scorn of belief in oracles. The *Bacchae* has been thought to display the viciousness of some Greek religious rituals, as Pentheus is torn apart by women (including his own mother) maddened by Dionysus. But the exact degree of Euripides' religious skepticism will always remain a matter of doubt.

S. T. JOSHI

EVANS, MARIAN (GEORGE ELIOT; 1819–1880), British writer. The SKEPTICISM of George Eliot is best summed up in words attributed to her in conversation with Fredrick William Henry Myers, a fellow of Trinity College, Cambridge, who also had lost his Christian faith. Myers "remembered how, at Cambridge, I walked with her once . . . on an evening of rainy May; and she, stirred somewhat beyond her wont, and taking as her text the three words which have been so often as the inspiring trumpet-calls of men,—the words *God*, *Immortality*, *Duty*—pronounced, with terrible earnestness, how inconceivable was the *first*, how unbelievable the *second*, and yet how peremptory and absolute the *third*."

Early Life. Mary Anne (later Marian) Evans, the youngest of three children from the second marriage of Robert Evans, the estate manager of the Newdigate family of Arbury Hall in North Warwickshire, was born at South Farm on the Arbury Estate on November 22, 1819. Her mother, Christiana Pearson, was a farmer's daughter who had two other children, Christiana ("Chrissey") and Isaac, with whom Mary Anne had a complex lrelationship.

The family moved when she was only a few months old to nearby Griff, the family home until she was twenty-one. Between 1825 and 1835 she attended various local boarding schools, where she was subject to daily Bible readings and hymns. At home, as Eliot scholar G. S. Haight notes, John Bunyan's *The Pilgrim's Progress*, Daniel Defoe's *The Political History of the Devil*, and Jeremy Taylor's *Holy Living and Holy Dying* were among the few books allowed. At school she came under the influence of Maria Lewis, an Evangelical teacher. Their letters are replete with biblical citations, allusions, and religious piety. Between the ages of thirteen and sixteen she boarded at a school in Coventry run by the two daughters of a Baptist minister, where the daily diet of Bible readings and hymns continued.

Coventry: The 1840s. Her mother died in 1836, and Evans, in addition to looking after her brother and her father, continued to read widely and learn languages. Following Isaac's marriage in 1841, she and her father moved to Foleshill, a Coventry suburb. In August 1838 she made her first visit to London. Eliot scholar John Walter Cross notes: "[S]he was so much under the influence of religious and ascetic ideas that she would not go to any of the theaters with her brother, but spent all her evenings alone reading . . . the chief thing she wanted to buy was Josephus's *History of the Jews*." Such interest in life under the Romans at the time of Jesus and of Jewish Resistance to the Romans suggests a questioning of received notions of the life of Jesus. Her neighbors and close friends at Foleshill who remained lifelong friends included the wealthy Unitarians (see UNITARIAN UNIVERSALISM) Charles Bray, Caroline Bray, and Sara Sophia Hennell. The Brays' house, Rosehill, was a mecca for freethinkers and radicals. Eliot read Charles Christian Hennell's *Inquiry concerning the Origin of Christianity* (1838), which questioned the belief in miracles and Jesus's divinity. On January 2, 1842, she refused to attend church with her father. She wrote to him that she regarded the "Jewish and Christian Scriptures . . . as history consisting of mingling truth and fiction." At Rosehill during the 1840s she met many radical thinkers, including Ralph Waldo EMERSON, Herbert SPENCER, Harriet MARTINEAU, and the London radical publisher John Chapman, for whom she was to work.

Important translations questioning received religious opinion emerge from this period. She took over from her friend "Rufa" Brabant the task of translating into English David Friedrich STRAUSS's *Das Leben Jesu*, published in German in 1835. The translation was sponsored by the radical freethinking politician Joseph Parkes and published by Chapman in June 1846. The translator's name

was absent from the title page of this reexamination of the events of Jesus's life, which found them without historical foundation and based on myth (see JESUS, HISTORICITY OF). During this period Evans wrote and reviewed for the *Coventry Herald*, and began a translation of the political writings of the great Dutch Jewish pantheist and radical Baruch SPINOZA.

London: The 1850s. In March 1850 Evans returned to England from Geneva, where she had gone following her father's death in May 1849. For a few years she lodged with her employer, John Chapman, and his family. She worked as an editor and contributor to his publications, mainly with the radical journal the *Westminster Review*. Chapman specialized in publications reflecting radical and skeptical perspectives. At Chapman's home she met many skeptics and freethinkers including Herbert SPENCER and George Henry Lewes. The former, a distinguished political philosopher, rejected her personal overtures. She formed a close relationship with Lewes, a journalist, editor, dramatist, physiologist, philosopher, novelist, and man of letters, which lasted from the mid-1850s until his death twenty-five years later. Lewes, married with children, was unable to obtain a divorce from his wife. Upon learning of the relationship, her beloved brother, Isaac, broke off all direct contact with his sister. He resumed it only in 1878, following Lewes's death. In addition to breaking totally with social convention in her personal life, she edited and wrote extensively on diverse subjects, including radical German thought.

In 1854 Chapman published under the name "Marian Evans" her translation of Ludwig FEUERBACH's freethinking *Das Wesen des Christenthums*, first published in 1840. At the core of Feuerbach lies a belief found in her fiction: the importance of human relationships rather than the supernatural or reliance upon a deity or god. Evans had, however, the greatest respect for religious expression and belief. She wrote to Charles Bray on July 5, 1859: "I can't tell you how much melancholy it causes me that people are, for the most part, so incapable of comprehending the state of mind which cares for that which is essentially human in all forms of belief, and desires to exhibit it under all forms with loving truthfulness. Free-thinkers are scarcely wider than the orthodox in this matter,—they all want to see themselves and their own opinions held up to the true and the lovely."

During the 1850s Evans and Lewes were influenced by the Positivist writings of the French thinker Auguste COMTE (see POSITIVISM). The early writings, with their emphasis upon the importance of human relationships, rejection of the metaphysical, and belief in some kind of objective reality, had a considerable impact upon Evans's writings. His later creation of positive rituals she and Lewes found themselves less in sympathy with. Ironically, George Eliot's poem "O May I Join the Choir Invisible," written in 1867, was adopted by the positivists as a central hymn in their ceremonies.

The Priory and Success. Encouraged by Lewes to write fiction, her early *Scenes of Clerical Life* (1858) and *Adam Bede* (1859) achieved success. She adopted the pseudonym "George Eliot." *The Mill on the Floss* (1860), a thinly disguised autobiographical novel, and *Silas Marner* (1861) cemented her status as a best-selling novelist. Real financial security was secured by the publication of *Romola*, the rights for which were negotiated by Lewes with the London publisher George Smith. This was the only occasion on which Lewes and Eliot left Blackwood's, the Edinburgh publisher with whom she published her other fiction, because of an exceptionally generous prepublication advance offered by Smith. As it happened, Smith lost money when sales of the novel failed to make good the advance; nonetheless, from its proceeds Lewes and Eliot moved in November 1863 to the Priory near Regents Park, where they would live until Lewes's death of enteritis on November 30, 1878. In November 1876 Eliot and Lewes bought the Heights, in Witley, Surrey, as a country retreat. In addition to traveling frequently on the European continent with Lewes, she produced poems and essays in addition to fiction. Her last three published novels, *Felix Holt, the Radical* (1866); *Middlemarch, A Study of Provincial Life* (1871–72); and *Daniel Deronda* (1875–76), have contrasting settings: provincial England in the time of the Reform Act, and, in her last completed novel, aristocratic English settings, European gambling casinos, and impoverished London Jewish homes. A central preoccupation in them is the theme of the improbable becoming possible.

Final Years: After Life. Following Lewes's death, Eliot shut herself away from the world. Somewhat surprisingly, on May 6, 1880, she married the banker John Walter Cross, twenty years her junior. On December 22, 1880, she died of kidney disease. Burial in Westminster Abbey was denied, and on December 29, 1880, she was laid to rest alongside Lewes in the dissenters' section of Highgate Cemetery, North London.

Following a period of critical neglect in the earlier part of the twentieth century, George Eliot's work became recognized as among the very greatest productions of Victorian fiction. In the words of the radical writer William Hale White, "[S]he was really one of the most skeptical, unusual creatures I ever knew."

EVIDENTIALISM. Evidentialism is a theory of epistemic justification which claims that the only propositions that should be accepted as true are those for which one has sufficient evidence. Propositions that are not so supported should not be accepted. The best known expression of this view is found in William Kingdon CLIFFORD's 1876 essay "The Ethics of Belief," in which he writes: "It is wrong always, everywhere, and for any one, to believe anything upon insufficient evidence."

Clifford was not the first to propose evidentialism. John LOCKE had earlier issued an evidentialist challenge to religious believers. Locke was critical of those he called *enthusiasts*—individuals who claimed to have received private revelations from God but who could offer no evidence other than their own word to support their claims. Locke was not only troubled by the seeming irrationality of such claims; he also held that enthusiasm in this regard was antisocial. Locke argued that only religious beliefs that could be supported by evidence were worthy of being held. He was confident that the doctrines of Christianity could be so supported—a view which Clifford would later strongly oppose.

Unlike Locke, David HUME raised serious questions about whether it is possible to choose one's beliefs, or alter them at will, in which case evidentialism would have no empirical support. Hume made a distinction between the vulgar masses, who in general do not examine their beliefs, and the wise, who as a result of experience have formed the habit of developing their critical faculties. Clifford would make no such distinction. For him, the duty to examine one's beliefs is the same for the intellectual in the ivory tower as it is for the simple tradesman drinking a beer in the alehouse. "No simplicity of mind," he was to write in "The Ethics of Belief," "no obscurity of station, can escape the universal duty of questioning all that we believe."

Since the mid-1970s, especially with the rise of the so-called reformed epistemology school in philosophy, Clifford's epistemic position has become more of a focal point of criticism, especially by Christian philosophers Peter van Inwagen and Alvin Plantinga. The former notes that Clifford's evidentialism, although theoretically pertinent to *any* human belief, is almost always applied to *religious* beliefs rather than to philosophical, economic, social, or political beliefs. However, Clifford himself was careful to state that his admonition was indeed for all beliefs—it is just that religious beliefs tend to be the ones that are more likely to be shielded from criticism.

No doubt the most prominent contemporary Christian writer to criticize Clifford is the Notre Dame professor Alvin Plantinga. A self-professed reformed epistemologist, tracing his intellectual sympathies back to John Calvin, Plantinga has long argued that it is rational to believe in God despite not having any evidence whatsoever, and that evidentialists like Clifford fail to make a good counterargument. Plantinga argued that some beliefs are "basic"—it is not necessary to provide evidence for them, since they are a matter of trusting our very cognitive faculties. Asking for evidence is equivalent to demanding what the foundation is for one's belief, but if basic beliefs do not exist, then foundationalism itself is guilty of infinite regress.

Plantinga criticizes foundationalism for holding to the view that propositions obtain warrant in only one of two ways: either through being a basic belief, or else through acquiring warrant by virtue of being believed on the basis of some other proposition that already has warrant. But this being the case, a proposition like "I believe in God" can be treated in the same manner as a proposition like "I believe I had Rice Krispies for breakfast this morning." Why do foundationalists demand evidence for the former and not the latter? Furthermore, members of a given belief community need not justify their basic beliefs to others. While faulting Clifford for his strident and simplistic tone, Plantinga is equally guilty of presenting the evidentialist view in an overly simplistic manner. Plantinga treats Clifford as a "stock" or "paradigm" figure, without necessarily carefully examining what Clifford himself really meant. Utilizing the views of John Calvin with approval, Plantinga argues that God has so created us that we have a tendency or disposition to see his hand in the world about us. Those who deny this, like Clifford, are deliberately ignoring such dispositions implanted within us by the creator. Why do some people not accept such beliefs? Plantinga implies that the nonbelievers either have an improperly functioning intellectual system, or are guilty of committing willful sin.

Locke and Clifford present a formula by which knowledge may be advanced on an objective basis. Critics of Plantinga point out that abandoning evidentialism leads to a type of fideism, a justification of beliefs based solely upon one's faith. Plantinga and his fellow reform epistemologists, for all their erudition, come rather close to following the enthusiastic line which Locke had critiqued at the very beginning of the evidentialist debate.

In addition to the foundationalistic controversy, there are other questions raised by evidentialism. First of all, do we really have control over our beliefs? This volition-

alist argument has led some to doubt that evidentialism is itself a tenable claim. If we cannot truly alter our beliefs in light of new evidence, then the very topic is moot. Others have given a more restrained volitional argument. William James, for instance, criticized Clifford in his 1896 essay "The Will to Believe" by claiming that Clifford's evidentialism was too rigid. There are cases where the evidence is itself inconclusive, such as when a person has climbed a mountain and found that the path down has become impassible. He or she needs to jump from one mountain peak to another in order to escape, but has no conclusive evidence as to whether this is possible or not. James argued that in such cases one has a *right* to believe, because the belief itself can aid in bringing about the very thing desired, reaching the opposite peak safely. Clifford would have responded that this was not a matter of believing in the truth of a proposition, but rather weighing probabilities, what he would call a "provisional belief." The difference between a Jamesian and Cliffordian evidentialism, therefore, revolves around whether, as James phrased it, "faith in a fact can help create the fact," and whether such faith can actually create its own verification (see VERIFICATIONISM). For James, religious beliefs tend to fall within this area, for by acting *as if* they are true, one can perhaps actually bring about the state of affairs—such as God's existence or an afterlife—to which they refer. Critics of James have pointed out that he confuses action itself with a disposition to act. The key point is that James actually agrees with Clifford's main assertion, that one should never believe anything upon insufficient evidence.

Another challenge to evidentialism is just what would constitute "sufficient evidence." As philosopher Mario Bunge has pointed out, evidence comes in degrees: strong, weak, and inconclusive. With strong evidence, nothing else but that evidence would confirm a claim or prediction. With weak or inconclusive evidence, however, that which tends to support a claim or prediction could be otherwise interpreted. For example, one person may hold that the existence of crop circles in an empty field is evidence of space aliens, whereas skeptics would argue that such circles have either a naturalistic explanation or are a hoax perpetrated by human beings. Advocates of evidentialism, therefore, are closely connected with adherents of the scientific method, and argue that proper evidence must be verifiable, testable, and replicable in order to count as strong or conclusive support. Religious claims based upon personal experience or strong emotions would be categorized as weak or inconclusive.

Finally, several contemporary writers have pointed out that a distinction needs to be made between ethical and epistemological evidentialism. Clifford conflates the two, but one can look upon them separately. For instance, there are bad epistemic habits, such as sloppy inquiry, jumping to conclusions, and wishful thinking, which, if unchecked, can have harmful effects upon one's formation of beliefs, but it is by no means evident that this is a moral issue. Lorraine Code, in her book *Epistemic Responsibility* (1987), has carefully distinguished these two categories, and Earl Conee and Richard Feldman, in their edited volume *Evidentialism* (2004), have given the strongest contemporary defense of epistemic evidentialism. Code herself, however, also provides a possible approach toward defending Clifford's overall strategy of combining ethical and epistemic evidentialism, by developing a model of what she calls "an intellectually virtuous character." This is a person, argues Code, who maintains "a matter of orientation toward the world and toward oneself as a knowledge-seeker in the world. . . . Intellectually virtuous persons value knowing and understanding how things really are. They resist the temptations to live with partial explanations where fuller ones are attainable; they resist the temptation to live in fantasy or in a world of dream or illusion, considering it better to know, despite the tempting comfort and complacency a life of fantasy or illusion (or one well tinged with fantasy or illusion) can offer."

EVIL, PROBLEM OF. The idea that at least some of the evil present in the world constitutes a problem for belief in the existence of God is both an ancient idea—going back at least to Job, and presumably beyond—and a very natural one. Whether evil is, however, a decisive objection to the existence of God has remained unclear, as various formulations of the argument from evil that initially seemed plausible have proven problematic. This entry is concerned, accordingly, with how the argument from evil should be formulated, and with the various ways in which theists can respond to the argument.

Formulating the Argument from Evil. *Relevant Conceptions of God.* If a creator of the universe is conceived of in certain ways, the existence of evil in the world has no bearing at all upon the likelihood that such a creator exists. This is true, for example, if one thinks in terms of a deistic god who brought the world into existence, but who then had no concern at all about the

events that subsequently took place, and so who would never intervene in the world in any way (see DEISM).

The argument from evil becomes relevant when one has a god whose moral character, in contrast to that of the god of deism, provides a ground for believing that fundamental human hopes—that death is not the end of an individual's existence, that evil will not triumph over good, and that, in the end, justice will be done—will be realized. To provide such a ground for hope, however, one needs a deity that is very powerful, very knowledgeable, and morally very good—and ideally, one who is unlimited in these respects.

A good starting point, accordingly, is with the question of whether the evils we find in the world provide good reason for concluding that the God of traditional monotheism—that is, an all-powerful, all-knowing, and perfectly good person who created the world—does not exist. As a result, formulations of the argument from evil typically focus upon precisely this conception of God. But this is not to say that the relevance of the argument from evil is limited to God, thus conceived: properly formulated, the argument from evil may also tell against a wide range of possible deities with finite knowledge and power who are less than perfectly good.

Logical versus Evidential Formulations of the Argument from Evil. The argument from evil starts from the fact that the world appears to contain states of affairs that are bad, or undesirable, or that should have been prevented by any being who could have done so; and it asks how the existence of such states of affairs is to be squared with the existence of God. But the argument can be formulated in two very different ways. First, it can be set out as a purely deductive argument that attempts to show that certain facts about the evil in the world are logically incompatible with the existence of God. One especially ambitious form of this first sort of argument attempts to establish the very strong claim that it is *logically impossible* for God to exist if there is *any* evil at all in the world.

So understood, the argument might be put as follows. If God exists, he will want to prevent evil, since he is by definition morally perfect. Being omniscient, he will know about any evil that is about to come into existence. And being omnipotent, he will have the power to prevent any such evil. So if God exists, he will be willing and able to prevent all evil. Therefore, if God exists, there will not be any evil. But the world does contain evil. Therefore, God does not exist.

This form of the argument initially has a striking and perhaps impressive quality. It seems very doubtful, however, that it is sound. The reason is that the claim that a morally perfect being would want to eliminate any evil that exists is not unproblematic, since what this claim can be seen to rest upon, when it is scrutinized, is the assumption that no evil is ever logically necessary for some good state of affairs that outweighs it. Is this claim true? Some people have argued that it is not. For example, some people have argued that the world is a better place if people develop desirable traits of character—such as patience and courage—by struggling against obstacles, including suffering. But if this is right, then the elimination of *all* suffering would actually make the world a worse place, by depriving people of the chance to develop desirable traits of character by responding appropriately to suffering that they undergo.

The examples that are usually advanced of cases where some evil is logically necessary for a greater good that outweighs the evil are not, perhaps, convincing. But, on the other hand, they do seem to show that one cannot establish, without appealing to some substantive, and controversial, moral theory, that there cannot be cases where some evil is logically necessary for a greater good that outweighs it. Consequently, it would seem that the argument from evil should be formulated in a different way—not as a deductive argument for the very strong claim that it is logically impossible for both God and evil to exist (or for God and certain types, or a certain amount, of evil to exist), but as an inductive (or evidential or probabilistic) argument for the more modest claim that some evils that actually exist in the world make it very unlikely that God exists.

Responses to the Argument from Evil: Refutations, Defenses, and Theodicies. A successful version of the argument from evil involves two claims. The first is that there are facts about evil in the world that make it prima facie unlikely that God exists. The second is that the situation is not altered when information about such facts is conjoined with all the other things that one is justified in believing. The existence of God is, therefore, also unlikely relative to the totality of what one is justified in believing.

A theist can respond to the argument from evil, then, by questioning either of these claims. Thus, a theist might grant that there are facts about evil that, other things being equal, render it unlikely that God exists, but then argue that when those considerations are combined with everything else that one is justified in believing, it turns out that it is not unlikely that God exists, all things considered. Alternatively, a theist can attempt to defend the more radical thesis that there are no facts about evil in the world that make it even prima facie unlikely that God exists.

If the latter thesis is correct, the argument from evil does not even get started. So let us refer to such responses to the argument from evil as attempted *total refutations*.

The claim that relevant facts about evils in the world do not make it even prima facie unlikely that God exists probably strikes most people as rather implausible. A number of philosophical theists have, however, attempted to defend this type of response to the argument from evil.

The other alternative open to the theist is to grant that there are facts about evils in the world that make it prima facie unlikely that God exists, but then to argue that the

existence of God is not unlikely, all things considered. But here there are two different possibilities. One involves offering a *theodicy*. For this, the theist must specify, for every actual evil found in the world, some state of affairs that it is reasonable to believe exists, and that constitutes a morally sufficient reason for an omnipotent and omniscient being's allowing the evil in question.

The second possibility open to the theist who grants that there are facts about evils in the world that render it prima facie unlikely that God exists is to offer a *defense*, where this involves attempting to show that it is *likely* that *there are* facts that would justify an omnipotent and omniscient being in not preventing the evils that we find in the world, even if we do not know what they are.

In short, a defense attempts to show only that some God-justifying reasons probably exist; a theodicy, by contrast, also attempts to specify what those God-justifying reasons are.

Total Refutations? How might one attempt to show that the evils found in the world are not even prima facie evidence against the existence of God? Three main ways have been advanced, involving, first, the ontological argument; second, the claim that there is no best of all possible worlds; and third, an appeal to human epistemological limitations.

An Appeal to the Ontological Argument. One way of attempting to show that facts about evil do not provide even prima facie evidence against the existence of God is by appealing to the ontological argument. For while relatively few philosophers have held that the ontological argument is sound, there have certainly been some who have—such as Anselm and René DESCARTES, and, more recently, Norman Malcolm, Charles Hartshorne, and Alvin Plantinga.

If the ontological argument were sound, it would certainly provide a completely decisive answer to all versions of the argument from evil, since if, as the ontological argument attempts to show, it is a logically necessary truth that an omnipotent, omniscient, and morally perfect being exists, then it follows that the proposition that God does not exist must have probability zero on any body of evidence whatever.

But is the ontological argument sound? The vast majority of present-day philosophers believe that it is not, and one way of arguing for that view is by appealing to variants on a type of objection that was directed against the ontological argument by Gaunilo, a contemporary of Anselm. What Gaunilo argued was that one can parallel Anselm's argument for the existence of a perfect being to arrive at the corresponding conclusions concerning perfect beings of any sort whatever—such as perfect islands, perfect unicorns, and so on. These conclusions, however, are surely very implausible. But, in addition, one can strengthen Gaunilo's objection by focusing on versions that lead to mutually incompatible conclusions, such as the conclusion that there is a perfect solvent, together with the conclusion that there is a perfectly insoluble substance. For if arguments with precisely the same logical form as the ontological argument and with equally acceptable premises generate contradictions, then the ontological argument must be unsound.

The "No Best of All Possible Worlds" Response. A second way of attempting to set out a total refutation of the argument from evil is by appealing to the claim that there is no best of all possible worlds, since if it is true, for *every* possible world, however good, that there is a better one, then the fact that this world is not the best of all possible worlds provides no reason for concluding that, if there is an omnipotent and omniscient being, that being cannot be morally perfect.

This response to the argument from evil has been strongly advocated by George Schlesinger and, more recently, by Peter Forrest—though Forrest, curiously, describes the defense as one that has been "neglected," and refers neither to Schlesinger's well-known discussions, nor to the very strong objections that have been directed against this response to the argument from evil.

The natural reply to this attempt to refute the argument from evil has been set out very clearly by Nicholas La Para and Haig Khatchadourian among others, and it has been developed in an especially forceful and detailed way by Keith Chrzan. The basic point is that the argument from evil, when properly formulated in a deontological fashion, does not involve the claim that this world could be improved upon, nor the claim that it is not the best of all possible worlds: it turns instead upon the claim that there are good reasons for holding that the world contains evils, including instances of suffering, that it would be morally wrong, all things considered, for an omnipotent and omniscient being to allow. As a consequence, the contention that there might be better and better worlds without limit is simply irrelevant to the argument from evil, properly formulated.

Human Epistemological Limitations. The most popular way of attempting to construct a total refutation of the argument from evil—and also one of the most common responses to the argument by present-day philosophical theists—involves an appeal to human cognitive limitations. The idea is this. Suppose that it is granted that there are apparent evils in the world that, judged in the light of the right-making and wrong-making, or goodmaking and badmaking, properties that we are aware of, it would be morally very wrong for an omnipotent and omniscient person to allow to exist. An omnipotent and omniscient being would surely be aware, however, of morally significant properties that we are not aware of. But, then, how can one be justified in concluding that apparent evils for which we can see no justification *have* no justification? How can one show that there are no God-justifying reasons for such evils that lie outside the scope of human knowledge?

This is a very important response to the argument from evil. The answer, as we shall see in section 6, is that an application of inductive logic enables one to show that

while it is logically possible that such God-justifying reasons exist, the probability that they do is very, very low.

Defenses to the Argument from Evil. Let us now consider defenses to the argument from evil—where, as indicated earlier, a defense involves an attempt to show that it is likely that every apparently gratuitous evil is such that an omnipotent and omniscient person would have a morally sufficient reason for not preventing its existence, but where no attempt is made to specify what those morally sufficient reasons might be.

The Appeal to Positive Evidence for the Existence of God. Theists have often contended that there are a variety of arguments that, even if they do not prove that God exists, provide positive evidence to that effect. The question arises, then, whether such positive evidence might not outweigh the negative evidence of apparently unjustified evils.

This thought has led a number of philosophers to claim that in order to be justified in asserting that there are evils in the world that establish that it is unlikely that God exists, one would first have to examine all of the traditional arguments for the existence of God, and show that none of them is sound. Alvin Plantinga, for example, says that in order for the atheologian to show that the existence of God is improbable relative to one's total evidence, "he would be obliged to consider all the sorts of reasons natural theologians have invoked in favor of theistic belief—the traditional cosmological, teleological and ontological arguments, for example." And in a similar vein, Bruce Reichenbach remarks: "With respect to the atheologian's inductive argument from evil, the theist might reasonably contend that the atheologian's exclusion of the theistic arguments or proofs for God's existence advanced by the natural theologian has skewed the results."

If one is defending an evidential version of the argument from evil, one certainly needs to consider what sorts of positive reasons might be offered in support of the existence of God. But Plantinga and Reichenbach are advancing a much stronger claim here, for they are saying that one needs to look at *all* of the traditional theistic arguments. They are claiming, in short, that if one of those arguments turned out to be defensible, then it would serve to undercut the argument from evil.

To see that this view is mistaken, consider the cosmological argument. In some versions of the cosmological argument, the conclusion is that there is an unmoved mover; in others, the conclusion is that there is a first cause; in still others, it is that there is a necessary being, having its necessity of itself. The crucial point is that none of these conclusions involves any claim about the moral character of the object in question, let alone the claim that it is a morally perfect person. In the absence of such a claim, however, one does not have an argument that, even if it turned out to be sound, could undercut the argument from evil.

The situation is not substantially different in the case of arguments from order in the world, since while such arguments, if sound, might provide grounds for drawing some tentative conclusion concerning the moral character of the designer or creator of the universe, the conclusion would not be one that could be used to overthrow the argument from evil. The reason is that given the mixture of good and evil that one finds in the world, no argument from order could provide support for the existence of a designer or creator who was even very good, let alone one who was morally perfect (see Intelligent Design Theory).

A similar conclusion holds for other arguments, such as those that appeal to purported miracles, or religious experiences (see Religious and Mystical Experiences). Thus, although in the case of religious experiences it might be argued that personal contact with a being may provide additional evidence concerning the person's character, it is clear that the primary evidence concerning a person's character must consist of information concerning what the person does and does not do. So, contrary to the claim advanced by Robert Adams, even if there were veridical religious experiences, they would not provide one with a satisfactory defense against the argument from evil.

An effective way of seeing the basic point here is by noticing that an alternative way of setting out the argument from evil is by assuming, for the sake of argument, that there is an omnipotent and omniscient person, and then viewing the argument as showing something about the moral character of any such omnipotent and omniscient person, namely, that is it is very unlikely that such a person is even morally good, let alone morally perfect.

Given such a reformulation of the argument from evil, it is clear that the vast majority of considerations that have been offered as reasons for believing in the existence of God are of no help to the person who is trying to resist the argument from evil, since most of them provide, at best, very tenuous grounds for any conclusion concerning the moral character of any omnipotent and omniscient being who may happen to exist.

The ontological argument is, of course, a notable exception, and, consequently, the advocate of the argument from evil certainly needs to be able to show that it is unsound. But almost all of the other standard arguments for the existence of God are simply irrelevant.

Induction Based on Partial Success. A second type of defense has been mentioned by Richard Swinburne. In an article in which he argued in support of the conclusion that theists need to offer a theodicy, Swinburne noted one minor qualification—namely, that if one could show, for a sufficiently impressive range of evils that initially seemed problematic, that it was likely that an omnipotent and omniscient person would be morally justified in not having prevented them, then one might very well be justified in believing that the same would be true of other evils, even if one could not specify, in those other cases, what the morally sufficient reason for allowing them might be.

What Swinburne says here is surely reasonable, and there would not seem to be any objection in principle to a defense of this sort. The problem with it, however, is that no theodicy that has ever been proposed has been successful in the relevant way—that is, no theodicy has been able to point to an impressive range of apparent evils where, when people are confronted with some proposed theodicy, they come to believe that the apparent evils are not really evils, all things considered.

Theodicies. Let us turn now to theodicies. What are the prospects for a complete or nearly complete theodicy? Some philosophers, such as Swinburne, are optimistic, and believe that "the required theodicy can be provided." Others, including many theists, are much less hopeful. Plantinga, for example, remarks: ". . . we cannot see *why* our world, with all its ills, would be better than others we think we can imagine, or *what*, in any detail, is God's reason for permitting a given specific and appalling evil. Not only can we not see this, we can't think of any very good possibilities. And here I must say that most attempts to explain *why* God permits evil—*theodicies*, as we may call them—strike me as tepid, shallow and ultimately frivolous."

What types of theodicies have been proposed? An exhaustive survey will not be possible here. Four approaches, however, are especially important. These involve an appeal, first, to the value of a world that is governed by natural laws; second, to the value of libertarian free will; third, to the value of the freedom to inflict horrendous evil upon others; and fourth, to the value of acquiring desirable traits of character in response to suffering.

Natural Laws. One historically important approach to theodicy turns upon the idea that it is crucially important that the world be governed by natural laws. This type of theodicy involves the following four claims. First, it is essential that events in the world take place in a regular way, since otherwise effective action on the part of humans would be impossible. Second, events will exhibit regular patterns only if they are governed by natural laws. Third, however, if events are governed by natural laws, the operation of those laws will give rise to events that harm individuals. Hence, fourth, God's allowing natural evils is justified because the existence of natural evils is entailed by natural laws, and a world without natural laws would be a much worse world.

This type of theodicy is open to decisive objections. First, precisely what natural evils a world contains depends not just on the laws of that world, but also on the initial, or boundary conditions. For example, an omnipotent being could create ex nihilo a world containing human beings, and with the same laws of nature as our world, but without nonhuman carnivores. Such a world would have immensely less suffering than our world, where many animals die very painful deaths at the hands (or, rather, claws and teeth) of other animals. Similarly, our world, rather than being a limited globe, could be an infinite plane, with unlimited room for populations to expand, along with ample natural resources to support such populations.

Second, many evils depend upon precisely what laws the world contains. An omnipotent being could, for example, easily create a world with the same laws of physics as our world, but with slightly different laws linking neurophysiological states with qualities of experiences, so that extremely intense pain either did not arise, or could be turned off when it served no purpose. Alternatively, additional physical laws of a rather specialized sort could be introduced that would cause very harmful viruses to self-destruct.

Third, this first approach to theodicy provides no account of moral evil—that is, the evil that results from immoral actions, unless it is held that human actions are also causally determined by natural laws. Of course, if other theodicies could provide a justification for God's allowing moral evil, that would not be a problem. But, as we shall, that does not appear to be the case.

Libertarian Free Will. A second important approach to theodicy, and one that focuses especially upon moral evil, involves the following ideas. First, while there are conceptions of free will that are compatible with one's behavior being completely determined, there is a type of free will—known as libertarian free will—that is incompatible with DETERMINISM, and it is precisely this type of freedom that is of great value. Second, because it is part of the definition of libertarian free will that an action that is free in that sense cannot be caused by anything outside of the agent, not even God can cause a person to freely do what is right. Third, in view of the great value of libertarian free will, it is better for God to create a world where agents possess libertarian free will—even though they may misuse it, and may do what is wrong—than for God to create a world where agents lack libertarian free will.

One problem with an appeal to libertarian free will is that no satisfactory account of the concept of libertarian free will is yet available. Thus, while the idea that, in order for an action to be free in the libertarian sense, it must not have any cause that lies outside the agent is unproblematic, this is not a sufficient condition, since that condition would be satisfied if the behavior in question were caused by random events within the agent. So one needs to add that the agent is, in some sense, the cause of the action.

But the problem with this is that present accounts of the metaphysics of causation typically treat causes as events, or states of affairs, and if one adopts such an approach, then it seems that all that one has when an action is freely done, in the libertarian sense, is that there is some uncaused mental state of the agent that causally gives rise to the relevant behavior, and the question is then why freedom, thus understood, should be thought to be valuable.

The alternative is to shift from event causation to what

is referred to as "agent causation." But then the problem is that there is no satisfactory account of agent causation.

But even if this initial difficulty concerning the nature of libertarian free will is set aside, there are still several very strong objections to any freewill approach to theodicy. In the first place, the fact that libertarian free will is valuable does not entail that one should never intervene when someone is performing an action that involves an exercise of libertarian free will, since very few people think, for example, that one should not intervene to prevent someone from committing rape or murder. On the contrary, almost everyone would hold that a failure to prevent heinously evil actions when one can do so would itself be seriously wrong.

Second, the claim that libertarian free will is valuable does not entail that it is a good thing for people to have the power to inflict great harm upon others. An omnipotent and omniscient being could, accordingly, create a world where individuals had libertarian free will, but did not have the power to torture and murder others.

Third, many evils are caused by natural processes, such as earthquakes, hurricanes, tsunamis, volcanoes, and so on, and by a wide variety of diseases. Such evils certainly do not appear to result from morally wrong actions, and if they do not, then no appeal to the value of libertarian free will can provide an answer to any version of the argument from evil that focuses upon such natural evils.

Some writers—such as C. S. Lewis and Alvin Plantinga—have suggested that what appear to be natural evils may ultimately be due instead to the immoral actions of supernatural beings. If that were so, then the result would be that the first two objections mentioned above would have increased force, since one would have many more cases where individuals were not only being given the power to inflict great harm on others, but also were being allowed by God to perform horrendously evil actions leading to enormous suffering and many deaths. But it can also be plausibly argued, in response to this Lewis/Plantinga move, that, although it is *possible* that earthquakes, hurricanes, cancer, and the predation of animals are all caused by malevolent supernatural beings, the probability that this is so is extremely low.

The Freedom to Do Great Evil. It was noted above that agents could be free in a libertarian sense even if they did not have the power to inflict great harm upon others. This point has led at least one theistic philosopher—namely, Richard Swinburne—to argue that, while free will is valuable, precisely how valuable it is depends upon the range of actions open to one. If possible actions vary enormously in moral worth, then, Swinburne claims, libertarian free will is very valuable indeed. But if the variation in the moral status of what one can do is very limited, then, Swinburne contends, libertarian free will adds much less to the world: one has, to his way of thinking, a "toy world," where one has very little responsibility for the well-being of others.

Swinburne's variant on the appeal to libertarian free will is also open to a number of objections. First, and as with freewill theodicies in general, this line of thought provides no justification for the existence of what appear to be natural evils.

Second, if what matters is simply the existence of alternative actions that differ greatly in moral value, such differences can exist even in a world where one lacks the power to inflict great *harm* on others, since there can be actions that would benefit others enormously, and which one may either perform or refrain from performing.

Third, what exactly is the underlying line of thought here? In the case of human actions, Swinburne surely holds that one should intervene to prevent someone from doing something that would be morally horrendous, if one can do so. Is the idea, then, that while occasional prevention of such evils does not significantly reduce the scope of the moral responsibility of others, if one's power were to increase, a point would be reached where one should sometimes refrain from preventing people from performing morally horrendous actions? But why should this be so? One answer might be that if one intervened too frequently, then people would come to believe that they did not have the ability to perform such actions. But, in the first place, it is not clear why that would be undesirable. People could still, for example, be thoroughly evil, for they could wish that they had the power to perform such terrible actions, and be disposed to perform such actions if they ever came to have the power. In the second place, prevention of deeply evil actions could take quite different forms. People could, for example, be given a conscience that led them, when they had decided to cause great injury to others, and were about to do so, to feel that what they were about to do was too terrible a thing, so that they would not carry out the action. In such a world, people could surely still feel that they themselves were capable of performing heinously evil actions, and so they would continue to attempt to perform such actions.

A Soul-Making Theodicy. A fourth and very important type of theodicy, championed especially by John Hick, involves the idea that the evils that the world contains can be seen to be justified if one views the world as designed by God as an environment in which people can, through the free decisions that they make, undergo spiritual growth that will ultimately fit them for communion with God:

> The value-judgment that is implicitly being invoked here is that one who has attained to goodness by meeting and eventually mastering temptation, and thus by rightly making responsibly choices in concrete situations, is good in a richer and more valuable sense than would be one created *ab initio* in a state either of innocence or of virtue. In the former case, which is that of the actual moral achievements of mankind, the individual's goodness has within it the strength of temptations over-

> come, a stability based upon an accumulation of right choices, and a positive and responsible character that comes from the investment of costly personal effort.

Hick's basic suggestion, then, is, first, that soul making is a great good; second, that God is therefore justified in designing a world with that purpose in mind; third, that our world is very well designed in that respect; and thus, fourth, that if one views evil as a problem, it is because one mistakenly thinks that the world ought, instead, to be a hedonistic paradise.

Is this theodicy satisfactory? There are a number of reasons for holding that it is not. First, there is the horrendous suffering that people undergo, either at the hands of others—as in the Holocaust—or because of terminal illnesses such as cancer. What is one to say about such evils? One writer—Eleonore Stump—has suggested that the terrible suffering that many people undergo at the end of their lives, in cases where it cannot be alleviated, is to be viewed as suffering that has been ordained by God for the spiritual health of the individual in question. But given that it does not seem to be true that terrible terminal illnesses more commonly fall upon those in bad spiritual health than upon those of good character, let alone that they fall only upon the former, this "spiritual chemotherapy" view seems very implausible. More generally, there seems to be no reason at all why a world must contain *horrendous* suffering if it is to provide a good environment for the development of character in response to challenges and temptations.

Second, and as illustrated by the weakness of Hick's own discussion, a soul-making theodicy provides no justification for the existence of any animal pain, let alone for a world where predation is not only present but a major feature of nonhuman animal life. The world could perfectly well have contained only human persons, or only human persons plus herbivores.

Third, the soul-making theodicy provides no account either of the suffering that young, innocent children endure, either because of terrible diseases or at the hands of adults. For here, as in the case of animals, there is no soul-making purpose that is served.

Finally, if one's purpose were to create a world that would be a good place for soul making, would our earth count as a job well done? It is very hard to see that it would. Some people die young, before they have had any chance at all to master temptations, to respond to challenges, and to develop morally. Others endure suffering so great that it is virtually impossible for them to develop those moral traits that involve relationships with other people. Still others enjoy lives of ease and luxury where there is virtually nothing that challenges them to undergo moral growth.

Inductive Logic and the Evidential Argument from Evil. In his article "Ruminations about Evil," William Rowe focuses upon the case of a young girl who is brutally beaten and murdered by her mother's boyfriend. If one knowingly allowed such an event to take place, one would be doing something that possessed a very serous wrong-making feature—that is, a property that would make one's failure to intervene morally wrong, and seriously so—unless there was some counterbalancing right-making property. When we humans contemplate such an occurrence, none of the right-making properties that we are familiar with are both present and sufficiently weighty to make it morally permissible for one not to have intervened, if one could have done so.

Consequently, the following claim is justified:

1. There are cases of allowing a young girl to be brutally beaten and murdered where the action of doing so has a serious wrong-making property that is not counterbalanced by any right-making property that we are aware of.

The crucial question is now whether we are justified in moving inductively from this claim to the conclusion that the following claim is *probably* true:

2. There are cases of allowing a young girl to be brutally beaten and murdered where the total wrong-making properties of allowing this, *both known and unknown*, are not counterbalanced by the total right-making properties, *both known and unknown*.

The reason that this inference is crucial is, first, that it can be shown, by a sound *deductive* argument, that (2) entails that God, defined as an omnipotent, omniscient, and morally perfect being, does not exist; and second, it then follows via postulates of inductive logic that, given (1), it is unlikely that God exists.

In the section "Human Epistemological Limitations," it was noted that one of the most common present-day responses to the evidential argument from evil involves the claim that probabilistic inferences of the sort involved in the move from (1) to (2) are rendered unsound by the fact that there may be any number of morally significant properties that lie outside the scope of human knowledge. Is this contention correct? The answer is that it is not.

To demonstrate this would require a rather technical argument in inductive logic. But one can gain an intuitive understanding of the basic idea in the following way. Suppose that there is some very significant right-making property of which we have no knowledge. If an action of allowing a child to be brutally killed possessed that property, then it might not be wrong to allow that action. But the existence of unknown right-making properties is no more likely, a priori, than of unknown wrong-making properties. So let us suppose, then, that there are two morally significant properties of which we humans have no knowledge—a right-making property, R, and a wrong-making property, W. Let us suppose, further, that

these two properties are equally weighty, since, a priori, there is no reason for supposing that one is more significant than the other. Finally, let *A* be an action of knowingly allowing a child to be brutally killed. We can see that there are four possibilities:

1. Action *A* has both unknown properties, *R* and *W*. In this case, those two unknown properties cancel one another out, and action *A* will be morally wrong, all things considered.
2. Action *A* has the unknown right-making property, *R*, but not the unknown wrong-making property, *W*. In this case, action *A* may be morally permissible, all things considered, if property *R* is sufficiently strong to outweigh the known wrong-making property of allowing a child to be brutally killed.
3. Action *A* has the unknown wrong-making property, *W*, but not the unknown right-making property, *R*. In this case, action *A* is even more wrong, all things considered, than it initially appeared to be.
4. Action *A* does not have either of the unknown, morally significant properties, *R* and *W*. In this case action *A* is morally wrong to precisely the degree that it initially appeared to be.

The upshot is that in three of the four possibilities that we have considered, action *A* turns out to be morally wrong, all things considered. Accordingly, the idea that there may be moral properties that lie outside the scope of human knowledge does not undermine in any way the probabilistic inference that is involved in the move from statement (1) to statement (2): if an action of knowingly allowing a child to be brutally killed is morally wrong as judged by the moral knowledge that we humans possess, then it is more likely than not that it is morally wrong judged by the totality of moral knowledge, including any moral truths that lie outside our ken.

A full exposition of this argument requires a careful application of inductive logic. But if one undertakes that task, what is the result? The answer is that if one considers a *single* action that is morally wrong as judged by the moral knowledge that we possess—such as that of knowingly allowing a child to be brutally killed—then the probability that that action is not morally wrong, all things considered, can be shown to be less than one half. If one considers *two* actions that are morally wrong as judged by the moral knowledge that we possess, then the probability that neither action is morally wrong, all things considered, can be shown to be less than one-third, since it turns out that the general result that one can establish is this:

> Suppose that there are n events, each of which, judged by *known* right-making and wrong-making properties, is such that it would be morally wrong to allow that event. Then, the probability that, judged in the light of *all* right-making and wrong-making properties, *known and unknown*, it would not be morally wrong to allow *any* of those events, must be less than $\frac{1}{n+1}$.

The conclusion, accordingly, is that by considering n apparent evils, one can show that the probability that God exists must be less than $\frac{1}{n+1}$.

The probability that God exists depends, then, on the number, n, of apparent evils. But this number is surely very large, given, for example, that the present population of the world is about six billion, and that most of those people during their lifetimes will suffer evils that they do not deserve to undergo—including various diseases, aging, and death. If this is right, then a version of the evidential argument from evil that makes use of inductive logic can be seen to generate the result that the probability that God exists is very low.

EVOLUTION AND UNBELIEF. See **LIFE, ORIGIN OF, AND UNBELIEF.**

EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST. Arguments for and against God's existence number in the hundreds. Only the "top ten" in each category will be presented and discussed here. The theistic arguments are numbered 1–10 and the atheistic arguments are numbered 11–20.

DEFINITIONS OF *GOD*

Before getting to the arguments, it is important to present the various definitions of *God* that they employ.

D1: God is the eternal, all-powerful, personal being who created and rules the universe. (Being eternal, God cannot come into or go out of existence. Being all-powerful, he can perform any action that is logically possible to perform. Being personal, he has some characteristics in common with humans, such as thinking, feeling emotions, and performing actions. The universe is understood to consist of all the space, time, matter, and energy that has ever existed.)

D2: God is the eternal, very powerful, personal being who rules the universe, loves humanity, and gave humanity its moral conscience.

D3: God is the eternal, very powerful, personal being who rules the universe, loves humanity, and strongly desires that that love be reciprocated.

D4: God is that being which is self-existent, that is, which contains the explanation for its own existence within itself.

D5: God is that being which is (objectively) perfect in every way. (The term "perfect" is here understood in an objective sense, as opposed to a subjective sense relative to individual values, so the term may be used in public reasoning.)

D6: God is the deity described in the Bible as interpreted by evangelical Christianity.

Each argument will be presented by means of a step-by-step formulation, followed by a consideration of possible objections to it. It will be indicated for each argument which of the above definitions of *God* it employs.

ARGUMENTS FOR GOD'S EXISTENCE

1. The Cosmological Argument (D1). (a) The entropy (or quantity of used-up energy) of the universe constantly increases. Also, the universe constantly expands and the hydrogen within each star is constantly being used up in the production of heat and light by atomic fusion. (b) Therefore, if the universe has always existed, then by now it would have reached a state of maximal entropy (with no usable energy remaining) and maximal expansion, and there would be no stars containing any hydrogen. (c) But the entropy level of the universe is not maximal. Usable energy still exists. Also, the universe is

not in a state of maximal expansion and there are stars that contain hydrogen. (d) It follows that the universe has not always existed: it must have had a beginning of some sort. (e) But everything that begins to exist must have a cause. (f) Therefore, the universe must have a cause. (g) But the only possible cause would have been an act of creation by God as defined by D1. (h) So God must have created the universe at some time in the past, and, being eternal, he cannot have gone out of existence. (i) Hence, God as defined by D1 must presently exist.

Objections. 1. Scientists have no information as to whether the entropy of the universe has always (from the beginning of time) been increasing. For all they know, there may have been periods in the past (maybe prior to the Big Bang) when the entropy of the universe decreased. Perhaps it regularly increases and decreases, and presently happens to be in an increasing stage. That the process may be reversed is also true of the expansion of the universe and the atomic fusion that occurs within stars. Although this alternate "oscillating universe" model is not advocated by a majority of cosmologists at the present time, it has not been definitely refuted either. It follows that premise (a) of the Cosmological Argument cannot be regarded as an established fact. For all that scientists know, the universe (i.e., space, time, matter, and energy), in some form or other, may have always existed.

2. There is no good reason to claim that things never come into existence uncaused. The fact that we do not experience such events in everyday life is not a good reason. Quantum theory allows for it and there are cosmologists who theorize that that is precisely how the universe originated. Therefore, premise (e) of the Cosmological Argument can legitimately be doubted.

3. Even assuming that the universe was caused, the cause need not have had all the properties ascribed to God in definition D1. Therefore, premise (g) of the Cosmological Argument is false, which makes the argument unsound.

2. The Argument from Design (D2). (a) Scientists try to explain the complexity that we observe in nature by appeal to the theory of evolution (TE). (b) But if TE were true, then we would probably have found by now an orderly sequence of fossils showing intermediate forms between main groups of organisms. (c) Yet no such fossils have ever been found. (d) Also, if TE were true, then there must have occurred (within the evolutionary process) violations of the second law of thermodynamics. (e) But no such violations have ever occurred. (f) Furthermore, an implication of TE is that, both in the chemical evolution of the original life-form and in the later biological evolution of complex life-forms from simpler forms (by chance mutations), there must have occurred a series of events with a probability so small as to be negligible. (g) For each of these three reasons [(b,c), (d,e), & (f)] taken separately, TE is very likely false. Taken jointly, they overwhelmingly establish the falsity of TE. (h) The only alternative to TE is to explain the complexity that we observe in nature by appeal to intelligent design. (i) The living organisms on earth exist in a physical environment that ideally suits them, or at least they did exist in such an environment in the past. (j) Hence, very probably, the earth's living organisms were created by some intelligent being who also designed their physical environment to ideally suit them [from (g)–(i)]. (k) But no being other than God as defined by D1 could have carried out such a creation. (l) So, it is highly likely that at some time in the past God, thus defined, created the earth's living organisms and designed their physical environment to ideally suit them, and thus exists.

Objections. 1. It is only under rare and unusual circumstances that dead bodies become fossilized, and it is only specially trained people who can recognize fossils. Hence, for any given organism that dies, it is highly unlikely that any part of its body would ever become fossilized and then discovered and recognized as being a fossil. Therefore, there is no reason whatsoever to regard premise (b) of the Argument from Design to be true.

2. Premises (c), (d), and (f) of the Argument from Design have all been refuted within the sciences. Thus, each of the three subarguments leading to step (g) of the argument contains at least one false premise, making each of them unsound. So, that step has not been established.

3. Even if TE were rejected, there are other alternatives to it than that mentioned in premise (h) of the Argument from Design, for example, the theory that the life-forms on our planet came to it from outer space. That refutes (h) and shows the argument to be unsound.

4. Living organisms on earth have always been subject to a hostile environment that has included severe storms, floods, droughts, earthquakes, volcanic eruptions, meteorite bombardments, disastrous weather patterns, disease, and predators. Therefore, their physical environment has never suited them ideally. It follows that premise (i) of the Argument from Design is false, which makes the argument unsound.

5. Even assuming that the life-forms on earth were created, there is no reason whatever to believe that their creator had all the particular defining properties of God given in definition D1. Therefore, there is no reason whatever to think that such a creator must have been God, thus defined. It follows that premise (k) of the Argument from Design is false, which makes the argument unsound.

Comment. The issues involved in objection 2 are enormously complex and the scientific literature relevant to them would fill a library. It is regrettable that space restrictions prohibit a fuller treatment and fuller bibliography on the topic here. This also applies to the objections to argument 1.

3. The Fine-Tuning Argument (D1). (a) The combination of physical constants that we observe in our uni-

verse is the only one capable of giving rise to, and sustaining, life as we know it. (b) Some explanation is needed as to why our universe has that particular combination of constants rather than some other conceivable combination. (c) One very good explanation of the given fact is the God hypothesis, according to which God, as defined by D1, designed our universe with the particular combination of physical constants that it has for the purpose of giving rise to, and sustaining, life as we know it. (d) No other explanation is as good as that one. (e) Hence, there is strong evidence that God, as defined by D1, exists.

Objections. 1. Definition D1 is unclear in various ways. For that reason, the hypothesis according to which God (as defined by D1) designed our universe fails to explain in a clear way what God is. It also fails to explain how God was supposed to have done the designing in question, why he made the universe so large in relation to life-forms, and why he permitted so much time (more than 10 billion years) to elapse for present-day life-forms to come about. Thus, the God hypothesis is unclear and incomplete, which makes it a poor explanation for the fact in question. It follows that premise (c) of the Fine-tuning Argument is false, which makes the argument unsound (see ANTHROPIC PRINCIPLE).

2. Physicists are trying to develop a "theory of everything" that would explain, among other things, why the universe has the particular combination of physical constants that it has. If successful, they would have a better explanation for the given facts than is the God hypothesis. There is no good reason to think that those physicists will eventually fail. Hence, there is no good reason to believe premise (d) of the Fine-Tuning Argument.

3. The fact that the universe has the particular combination of constants that it has can be regarded as simply a "brute fact" about it (i.e., a matter of sheer coincidence). It is possible that there are or have been in fact trillions of other universes with other combinations of constants. It is also possible that other combinations of constants would have produced universes at least as complex and interesting as ours. There is no reason to deny either of those possibilities and if either of them were true, then there would be nothing surprising about the fact that our universe has the particular combination of constants that it has, even if it were just a brute fact that it does so. But the brute-fact hypothesis does not have any of the defects of the God hypothesis. Hence, it is a better explanation for the given facts than is the God hypothesis. Therefore, premise (d) of the Fine-Tuning Argument is false, which makes the argument unsound.

4. Even given that our universe was designed to have the particular combination of physical constants that it has, the hypothesis that it was designed by some being or beings other than God, as defined by D1, is more likely true than the God hypothesis. Hence, premise (d) of the Fine-Tuning Argument is false, which makes the argument unsound.

4. The Argument from Mind (D1). (a) Mind (or consciousness or reason) exists. (b) One very good explanation for it is that God, as defined by D1, created it. (c) No other explanation is adequate. (d) Thus, there is strong evidence that God, as defined in the given way, exists.

Objections. 1. The God hypothesis can be severely attacked (objection 1 to argument 3, above, and objection 2 to argument 7, below). Hence, the God hypothesis is not a good explanation for anything. Therefore, premise (b) of the Argument from Mind is false, which makes the argument unsound.

2. Biology, psychology, and neuroscience together provide an adequate explanation for the existence of mind. Therefore, premise (c) of the Argument from Mind is false, which makes the argument unsound.

5. The Argument from Miracles (D1). (a) A miracle, by definition, is an event that violates some law of nature and is caused by a supernatural being. (b) Miracles, defined in that way, have occurred. An example is the raising of Jesus from the dead. Other examples are miraculous healings (unexplainable by science) that have occurred. (c) Those miracles (by definition) must have been performed by some supernatural being. (d) If any supernatural being exists, then God, as defined by D1, must also exist. (e) Hence, God, thus defined, exists.

Objections. 1. For every miracle ever alleged to have occurred, there is a body of eyewitness evidence (call it *M*) that supports the occurrence of the miracle and another body of evidence (call it *L*) against it, including all the evidence supporting the law violated by the alleged miracle. Since all laws of nature are supported by a body of evidence that is huge and vast, *L* must be huge and vast. There has never been a case, so far as we know, in which *M* outweighed *L*. For every alleged miracle, evidence *L* has always outweighed evidence *M* (see HUME, DAVID). Thus, for every alleged miracle, it is more likely that it did not actually occur than that it did. Hence, premise (b) of the Argument from Miracles is probably false (see MIRACLES, UNBELIEF IN).

2. Even if miracles occur, they may be brought about by supernatural beings other than God (as defined by D1) and God may not exist. Therefore, premise (d) of the Argument from Miracles is false, which makes the argument unsound.

Comment. A defect in the concept of omnipotence is pointed out in argument 13, below. Because of that, no argument for the existence of God as defined by D1 could possibly succeed. (This could be regarded as an additional objection to each of the arguments, above, that make use of D1.) In definitions D2 and D3, the expression "all-powerful" is replaced by "very powerful," so argument 13 is not applicable to those definitions.

6. The Moral Argument (D2). (a) There are certain actions that everybody agrees are morally right or morally wrong. (b) Given such agreement about

morality, there must exist objective moral values. (c) Therefore, it is a fact that such values exist. (d) That fact is adequately explained by the hypothesis that God, as defined by D2, created moral values. (e) There is no other adequate explanation for the given fact. (f) Hence, God, thus defined, must exist.

Objections. 1. The fact that there is much agreement among people regarding moral values (assuming that is a fact) can be adequately explained without appeal to the idea that those values are objective, for example, within the fields of anthropology and sociobiology. Hence, the Moral Argument's premise (b) is false, which makes the argument unsound (see ETHICS AND UNBELIEF).

2. Even given that there are objective moral values, God could not have created them, for it is conceptually impossible for God to have made something morally right that we know is wrong, or vice versa. Therefore, premise (d) of the Moral Argument is false, which makes the argument unsound.

3. The existence of objective moral values (assuming they exist) could be adequately explained by various nontheistic ethical theories, such as CONSEQUENTIALISM and intuitionism. Therefore, premise (e) of the Moral Argument is false, which makes the argument unsound.

7. The Cumulative Case Argument (D2). (a) There are many facts and events that need to be explained. The existence of the universe, complex living organisms and their sustaining environment, the conditions that made life possible, mind (or consciousness), the occurrence of alleged miracles, and the existence of objective moral values (mentioned in the arguments above) are just a few of them. Some others are the universality of religious belief, the occurrence of religious experiences in people, love, and the willingness of some people to die for their faith. (b) Theism and ATHEISM, understood in terms of definition D2, are the two great hypothetical frameworks within which explanations for all those facts and events might be constructed. (c) Theism is able to adequately explain all the phenomena. (d) Atheism is unable to do it. (e) There are also prudential factors which make the theistic hypothesis the preferable one: (1) It is being on the safe side, just in case God does exist. (2) It helps people to be moral because they think that would please God. (3) It provides people with a sense of meaningfulness (or purposefulness) in life, which is good to have, by causing them to see the world as a great system in which they and everyone and everything else has been assigned some significant role. Also, it gives people comfort and hope because they see the world as being providentially guided by a loving father and as containing the opportunity for eternal life. (f) For all of the reasons mentioned in (c), (d), and (e), taken cumulatively, theism must be declared the preferable hypothesis between the two explanatory frameworks. (g) It follows that theism is more likely true than atheism: God, as defined by D2, probably exists.

Objections. 1. There are many definitions of "God" other than D2, and many different explanatory frameworks for the various phenomena mentioned in premise (a) of the Cumulative Case Argument. It follows that premise (b) of the argument is unduly narrow and false, making the argument unsound.

2. The purpose of explanation is illumination and understanding. In order for the God hypothesis to provide those things, we need to know what God is, how and why God does things, and how God originated. But we do not know what God is. Definition D2, above, does not adequately provide that information. We need to know God's composition and in what respects, if any, God is like a human, and these things we do not know. Nor do we know how God does things; theists simply declare that to be a great mystery. Nor do we know why God does things. The motivations ascribed to him in the Bible conflict with the way we observe the world to be (as shown in the arguments from Evil, Nonbelief, and Confusion, below). Theists usually end up with the Unknown-Purpose Defense, thereby conceding that we do not know why God does things. Nor do we have any intelligible answer to the question of God's origin. (See arguments 8 and 17, below.) Hence, the God hypothesis provides no illumination or understanding, and so it does not satisfy the purpose of explanation. It follows that the God hypothesis does not really explain anything at all. Thus, premise (c) of the Cumulative Case Argument is false, which makes the argument unsound.

3. As argued by Richard Carrier and others, atheism in the form of metaphysical naturalism can adequately explain all the relevant phenomena. Therefore, premise (d) of the Cumulative Case Argument is false, which makes the argument unsound.

4. The practical or prudential factors appealed to in premise (e) of the Cumulative Case Argument do not make theism preferable to atheism in any sense of the term "preferable" that entails that theism is more likely true than atheism. Therefore, premise (e) of the argument lends no support whatever to its conclusion (g), and is irrelevant to the topic.

5. Some further objections to premise (e) are the following: (1) There is no reason whatsoever to think that theists are "on the safe side." For all we know, there may be unseen forces that make it very risky to be a theist. If one is going to believe in supernatural beings, one could as well believe that they are hostile toward theists as that they are friendly toward them. Therefore, there is no reason whatsoever to believe part (1) of premise (e), as given (see PASCAL'S WAGER). (2) Many atheists are moral and many theists are not moral. Therefore, part (2) of premise (e) applies, at most, to only some people. It is unclear how theism might help people to be moral. (Is it through an appeal to their selfish desire for future rewards? If so, then clearly more than theism is involved there, and furthermore, their motivation for being moral

is defective.) For these reasons, part (2) can be doubted. (3) There is no reason whatever to think that God, as defined, has assigned a purpose to everyone and everything, or is like a loving father, or has provided people with an opportunity for eternal life. Hence, anyone who has the sense of purposefulness or the sort of comfort or hope mentioned in part (3) has not obtained it from theism alone. Furthermore, not everyone wants to have a sense of purposefulness gained from the idea that God assigns purposes. Some people prefer feeling free to formulate their own purposes in life. And not everyone gains comfort or hope from ideas associated with theism. Some people are mentally disturbed by it all. For these reasons, part (3) of premise (e) of the Cumulative Case Argument lends no support whatever to the conclusion that theism, as a hypothesis, is preferable to atheism. We can see that not only is the whole appeal to practical or prudential reasons irrelevant to our topic, but the actual reasons which are given are in themselves exceedingly weak. The alleged "Cumulative Case" fails in every respect.

8. The Ultimate Explanation Argument (D4). (a) If everything were to depend for its existence on something else, then there would be an endless regress of things, without there being any ultimate explanation for anything. (b) But it is impossible that there should be no ultimate explanation for anything. (c) Thus, it is impossible that everything should depend for its existence on something else. (d) It follows that there must be something that exists totally independently and necessarily, which contains the explanation for its own existence within itself. (e) Hence, God, as defined by D4, must exist.

Objections. 1. The concept of necessary existence is unclear. (As Hume said, "[W]hatever can be conceived of as existing can also be conceived of as not existing.") Also, the concept of something "containing the explanation for its own existence within itself" and the concept of an "ultimate explanation" are both unclear. (See argument 17, below.) Therefore, the Ultimate Explanation Argument, which makes appeal to all those concepts, is unclear. It is hard to make any sense of it whatever. Hence, the argument is defective and needs to be rejected.

2. Even aside from the unclarity inherent in the Ultimate Explanation Argument, there is no reason whatever to accept its premise (b). Why not maintain that time, events, and explanations for things simply go back indefinitely, with no starting point, or alternatively, that it all began at some initial moment, uncaused, and thereby unexplained? (See objections 1 and 2 to argument 1, above.) Without any support for premise (b), the argument may be reasonably rejected.

Comments. A slightly different version of the Ultimate Explanation Argument appeals to the idea that God, by definition, is not a contingent being in the sense of something that may or may not exist, thus God's existence is either necessary or impossible. And since there is no contradiction inherent in the idea of God's existence, it follows that his existence is not impossible, and so he necessarily exists. (This is sometimes called the Modal Cosmological Argument, distinguishing it from argument 1, above, which is called the Temporal Cosmological Argument.) Aside from the unclarity inherent in the idea of necessary existence, there is the further objection that the argument can simply be turned around: "Since God's existence is either necessary or impossible, and since there is no contradiction inherent in the idea of God's nonexistence, it follows that his existence is not necessary, and so it is impossible for God to exist." With no good reason to prefer the theistic version of the argument over the atheistic version, both arguments should be dismissed as absurd.

It should be noted that definition D4 and the Ultimate Explanation Argument are not used in ordinary language or in the thinking of laymen or any clear-minded theists. They are sometimes encountered in the writings of philosophers or theologians, which is the only reason for including them here. The same is true of definition D5 and the Ontological Argument, below.

9. The Ontological Argument (D5). (a) God as defined by D5 is objectively perfect in every way. (b) For a being to exist is better than not to exist. (c) So, if a being were nonexistent, then it could not be objectively perfect in every way. (d) Thus, God cannot be nonexistent [from (a) & (c)]. (e) Hence, God, as defined by D5, must exist.

Objections. 1. Perfection is relative. What is perfect to one person may not be perfect to another, and there is no objective way to settle such disputes. Therefore, the concept of "objectively perfect," as a concept to be employed in public reasoning, makes no sense. It follows that definition D5 and premise (a) of the Ontological Argument, both of which make appeal to that concept, are incoherent. Hence, the argument is defective and must be rejected.

2. Even assuming that the Ontological Argument is intelligible, there is no good reason to accept its premise (b). There are some beings (e.g., demons) that practically everyone would regard to be better not to exist. Therefore, the argument has failed to establish its conclusion.

10. The Argument from the Bible (D6). (a) The Bible contains all of the following: remarkably fulfilled prophecies, an absence of unfulfilled prophecies, a convincing eyewitness account of the resurrection and subsequent appearances of Jesus, an absence of contradictions, amazing facts about the planet earth that were unknown to the general public in ancient times, an absence of factual errors, and a perfect moral system. (b) The only reasonable explanation for all of that is the

hypothesis that the Bible, as interpreted by evangelical Christianity, is divinely inspired and totally true. (c) It follows that the deity described in the Bible, as interpreted by evangelical Christianity (which is God as defined by D6), must exist.

Objection. All the alleged facts appealed to in premise (a) have been discredited, so the argument is unsound; see argument 19, below.

Arguments against God's Existence

11. The Anticreation Argument (D1, D6). (a) If *X* creates *Y*, then *X* must exist temporally prior to *Y*. (b) But nothing could possibly exist temporally prior to time itself (for that would involve existing at a time when there was no time, which is a contradiction). (c) Thus, it is impossible for time to have been created. (d) Time is an essential component of the universe. (e) Therefore, it is impossible for the universe to have been created. (f) It follows that God, as defined by D1 and D6, cannot exist.

Discussion. A similar argument might possibly be constructed with regard to the other components of the universe as well: space, matter, and energy. It is very hard to comprehend how a being could have created the universe without existing within space and without any involvement with matter or energy.

The God of evangelical Christianity (defined by D6) is included here (and for argument 12, below) because of the first sentence in the Bible, which evangelicals take to refer to the entire universe.

12. The Transcendent-Personal Argument (D1, D6). (a) In order for God to have created the universe, he must have been transcendent, that is, he must have existed outside space and time. (b) But to be personal implies (among other things) being within space and time. (c) Therefore, it is logically impossible for God, as defined by D1 or D6, to exist.

Discussion. It might be suggested that God has a part that is outside space and time and another part that is inside space and time and that it is the latter part, not the former part, which is personal in nature. But the idea of a being that is partly personal and partly transcendent is incomprehensible. Furthermore, definition D1 implies that God, as a personal being, existed prior to the universe, and it is incomprehensible how a personal being could do so.

Aside from conceptual considerations that have to do with the very concept of "being personal," there are empirical considerations relevant to premise (b). It might be argued that to be personal requires having thoughts, and that science has very strongly confirmed that having thoughts is dependent on having a physical brain. For example, since brain damage has always been found to delete, or at least disrupt, thoughts, it can be extrapolated that there can be no thoughts at all in the total absence of a brain (see Cognitive Science and Unbelief). Although the empirical support for premise (b) is very strong, that may not be a factor that would impress people who are not scientifically oriented to begin with.

13. The Incoherence of Omnipotence Argument (D1, D6). (a) If God as defined by D1 or D6 were to exist, then he would be omnipotent (i.e., able to do anything that is logically possible). (b) But the idea of such a being is incoherent. (c) Hence, such a being cannot possibly exist.

Discussion. Definition D6 is included here because evangelical Christians maintain that the biblical description of God as "Almighty" is accurate. The issue of whether or not premise (b) is true is complicated. Some writers claim that the idea of omnipotence in itself is inconsistent. Also, some writers claim that being omnipotent is incompatible with possessing certain other properties. (For example, an omnipotent being could commit suicide, since to do so is logically possible, but an eternal being, by definition, could not. Hence, the idea of the deity defined by D1 or D6 is incoherent.) Whether or not the given claim is true is here left open. See comments on the concept of "incoherence" made in connection with argument 17, below.

The divine attribute of omniscience gives rise to similar considerations, and there is an Incoherence of Omniscience Argument that could be raised. That argument, which is omitted here to save space, also has a premise (b) (worded as in argument 13), which introduces issues that are exceedingly complicated and controversial.

14. The Lack of Evidence Argument (D1, D2, D3, D6). (a) If God as defined by any of the four definitions in question were to exist, then he would have to be deeply involved in the affairs of humanity and there would be good objective evidence of his existence. (b) But there is no good objective evidence for the existence of a deity thus defined, seeing as arguments 1 through 7 and 10, above, have all been refuted. (c) Therefore, God, as defined by D1, D2, D3, or D6, does not exist.

Discussion. The rationale behind premise (a) is that the sort of deity in question, a personal being who rules the universe or who loves humanity (and perhaps wants that love reciprocated), would need to become involved in the affairs of humans and thereby reveal his existence overtly. It might be claimed that God has achieved such involvement just by means of subjective religious experiences, without providing humanity with any good objective evidence of his existence. This assertion could be attacked on the grounds that people who claim to have had such experiences are mistaken about the nature and cause of them. It might also be reasonably argued that religious experiences would be insufficient for the given divine purposes, and only good objective (publicly testable) evidence of some sort would do. Argument 14 is a versatile argument that can be widely used by atheists to attack God's existence, given many different definitions of "God."

Another argument similar to 14, sometimes put forward by scientifically oriented atheists, is the Argument from Metaphysical Naturalism, according to which all phenomena ever observed are best explained by appeal to natural causes. Since that premise is a reason to accept naturalism, it provides an evidential argument against God's existence. However, the given premise is an extremely sweeping one and for that reason alone argument 14 would be preferable.

15. The Argument from Evil (D2, D3, D6). (a) If there were to exist a very powerful, personal being who rules the universe and loves humanity, then there would not occur as much evil (i.e., suffering and premature death) as there does. (b) But there does occur that much evil. (c) Therefore, there does not exist such a being. (d) Hence, God, as defined by D2, D3, or D6, does not exist.

Discussion. This formulation of the argument is a version of what is called "the Logical Argument from Evil" (see EVIL, PROBLEM OF). If the word "probably" were to be inserted into steps (a), (c), and (d), then it would be a version of what is called "the Evidential Argument from Evil." Similar considerations arise in connection with the different versions.

According to the Freewill Defense, premise (a) is false because God wants people to have free will and that requires that they be able to create evil. The evil that actually occurs in our world is mankind's fault, not God's. Thus, God can still love humanity and be perfectly good despite all the evil that occurs. There are many objections to this defense. One of them is that much of the suffering and premature death that occurs in our world is due to natural causes rather than human choices, and the Freewill Defense is totally irrelevant to that form of evil.

16. The Argument from Nonbelief (D3, D6). (a) If there were to exist a very powerful, personal being who rules the universe, loves humanity, and who strongly desires that his love for humanity be reciprocated, then there would not exist as much nonbelief in the existence of such a being as there does. (b) But there does exist that much nonbelief. (c) Therefore, there does not exist such a being. (d) Hence, God, as defined by D3 or D6, does not exist.

Discussion. As with the Argument from Evil, an "evidential" version of this argument could be constructed by inserting the word "probably" into steps (a), (c), and (d). Similar considerations arise for all the various versions. The argument is directed against the deity defined by D6, as well as the one defined by D3, because evangelical Christians take God to have all the properties mentioned in D3. Possibly the argument might also be directed against the deity defined by D2, and something like that is attempted by J. L. Schellenberg, though there it would not be quite so forceful.

The rationale behind premise (a) is that nonbelief in God is an impediment to loving him, so a deity as described by definition D3 or D6 would remove that impediment if he were to exist (see UNBELIEF AS A PROBLEM FOR THEISM).

Defenses similar to those in the case of the Argument from Evil could be raised, and similar objections to them could be presented.

17. Arguments from Incoherence (D4, D5, D6). (a) In order for X to explain Y, not only must Y be derivable from X, but the derivation needs to be in some way illuminating. (b) If X is derived from itself, then the derivation is in no way illuminating. (c) Thus, it is impossible for anything to explain itself. (d) God as defined by D4 is supposed to explain itself. (e) It follows that the idea of "God" as defined by D4 is incoherent. (f) Furthermore, as pointed out in connection with argument 9, perfection is relative, and so the concept of "objectively perfect," as a concept employed in public reasoning, makes no sense. (g) Hence, the idea of "God" as defined by D5 is also incoherent. (h) In addition, the Bible contains descriptions of God that are incoherent (e.g., implying both that Jesus is God and that Jesus is God's son, that God is spirit or a spirit and that God is love). (i) Evangelical Christians interpret those descriptions literally. (j) Therefore, it might be argued that the idea of "God" as defined by D6 is also incoherent.

Discussion. Unlike the other arguments in this section, these arguments do not aim to prove God's nonexistence, but rather, the incoherence of God talk when "God" is defined in certain ways. The point is not that theists who employ such God talk are mistaken about the world, but that they are confused in their language (see NONCOGNITIVISM).

The idea of "incoherence" is also sometimes applied to contradictions or other sorts of conceptual incompatibility. For example, arguments 12 and 13, above, could each be regarded as a kind of "argument from incoherence," for they appeal to conceptual incompatibilities between pairs of divine attributes. (This point might also be applicable to definition D5 if theists were to try to combine it with other definitions. For example, if a theist were to claim that God is both perfect [as given in D5] and the creator of the universe [as given in D1], then it might be argued that such a notion is incoherent, since a perfect being can have no wants, whereas a creator must have some wants. Or if a theist were to claim that God is perfect and also loves humanity [as given in D2 and D3], then it might be argued that such a notion is incoherent, since a perfect being can feel no disappointment, whereas a being who loves humanity must feel some disappointment.) However, this notion of "incoherence" is different from that appealed to in the Arguments from Incoherence, for if incompatible properties are ascribed, at least there is a conjunction of propositions there, even if it is a contradictory pair. In that case, it would still make sense to say that the sentence "God exists"

expresses a (necessarily) false proposition. But with the sort of "incoherence" appealed to in the Arguments from Incoherence there is no proposition expressed at all, whether true or false. (For more on incompatible-properties arguments against God's existence, see Martin and Monnier, 2003.)

18. The Argument from Confusion (D6). (a) If the deity described in the Bible as interpreted by evangelical Christianity were to exist, then there would not exist as much confusion and conflictedness among Christians as there does, particularly with regard to important doctrinal issues such as God's laws and the requirements for salvation. (b) But there does exist that much; Christians disagree widely among themselves on such issues, as shown, among other things, by the great number of different Christian denominations and sects that exist. (c) Therefore, that deity does not exist. (d) Hence God as defined by D6 does not exist.

Discussion. The rationale behind premise (a) is that the God of evangelical Christianity is a deity who places great emphasis upon awareness of the truth, especially with regard to important doctrinal issues. It is expected, then, that if such a deity were to exist, he would place a high priority upon the elimination of confusion and conflictedness among his own followers with regard to important doctrinal issues. Because of the great abundance of Christian confusion of the relevant sort, this argument is a very forceful one.

19. The Argument from Biblical Defects (D6). (a) If the deity described in the Bible as interpreted by evangelical Christianity were to exist, then the Bible itself would not have the defects that it has. That is, it would not contain textual errors, interpolations, contradictions, factual errors (including false prophecies), and ethical defects. Also, the canon would have been assembled with less political involvement and would not have original manuscripts or parts missing. (b) But the Bible does contain those defects. (c) Therefore, that deity, which is God as defined by D6, does not exist.

Discussion. Premise (a) is based on the point that evangelical Christians regard the Bible to be God's main form of revelation to humanity. So, given that their God exists, it would be expected that the Bible would possess features implied by the motivations which they ascribe to him. Premise (a) follows quite naturally.

20. The Argument from Human Insignificance (D6). (a) If the deity described in the Bible as interpreted by evangelical Christianity were to exist, then it would be expected that humans occupy some significant place in the universe. (b) But, both from the standpoint of space (the size of the universe in relation to the size of the earth) and from the standpoint of time (the length of time in which the universe has existed in relation to the length of time in which humans have existed), humans do not occupy any significant place in the universe. (c) Hence, God, as defined by D6, probably does not exist.

Discussion. The idea behind the first premise here is that the Bible describes God as having a very special interest in humans. Since humans are so important, they should naturally occupy some significant place in space and time. To reject that idea is to reject the evangelical Christian outlook on the nature of reality. (A slightly different version of this argument is referred to by Nicholas Everitt as "the Argument from Scale.")

There are many other arguments against God's existence. Some are inductive in form; some make appeal to cosmological assumptions. In this brief outline, just those regarded as the main ones were selected for coverage.

Summary

The various arguments can be matched up with the six definitions of *God* as follows:

DEFINITION	ARGUMENTS FOR GOD	ARGUMENTS AGAINST GOD
D1	#1–5	#11–14
D2	#6, #7	#14, #15 (+ possibly #16)
D3	–	#14–16
D4	#8	#17
D5	#9	#17
D6	#10	#11–20

All of the arguments for God's existence can be refuted by at least one objection, and all of the definitions of "God" considered here permit God's nonexistence to be established (or else God talk to be shown incoherent) by at least one argument. Other definitions of "God" are used in ordinary language, but all of them permit God's nonexistence to be established by appeal to similar or analogous considerations. There is much more to be said about the various arguments.

EXISTENTIALISM. Existentialism is the name given to the body of thought of a number of loosely linked, mainly French and German, thinkers. Like most such umbrella terms, it conceals a great deal of diversity; inevitably, attempting to characterize the main themes and views of the movement obscures a number of fundamental disagreements. For the most part, existentialists were unified by shared themes, rather than shared truth claims, as well as by a shared sense of the reality and the importance of freedom in human life. Existentialists stressed the limits of reason and the concomitant necessity of the individual committing oneself to a life plan justified only by one's resolute choice. A life chosen in this way is lived according to the master value of existentialism: authenticity.

Existentialism is essentially a twentieth-century movement, first emerging clearly in the early work of the German philosopher Martin Heidegger, especially in his masterpiece *Being and Time* (1927). However, it had its roots in the nineteenth century, in broad cultural movements like Romanticism, and more especially in the work of the two thinkers who deserve to be called its founding fathers, Søren KIERKEGAARD and Friedrich NIETZSCHE. Beginning from premises that were diametrically opposed, both men reached the characteristic existentialist conclusion that a free and ultimately unjustifiable choice was central to authentic human existence. For Kierkegaard, this choice was a leap of faith, an acceptance of God's existence and the truth of Christianity in the face of a lucid recognition that this leap goes beyond what is rationally demonstrable. Nietzsche, too, stresses the necessity of a choice that is unjustifiable, but for him the unjustifiability is the product of the "death of God," by which he means not only increasing religious SKEPTICISM, but also the growing recognition that values are not part of the fabric of nature. For Nietzsche, the death of God signifies the end of an era in which values were held to govern human life in much the same way as the laws of nature; now that we recognize that values are invented, not discovered, we can and must choose our own.

After the death of god *or* in the face of the inability to rationally justify our ultimate values, we are each forced back upon ourselves in choosing our life plan. For both Nietzsche and Kierkegaard, an authentic life requires each of us to choose without regard to the opinions of the masses of humanity. Each sees easy conformism as a constant temptation, and as a sure route to meaninglessness. The authentic individual makes his or her own way in the world, and answers for his or her own choices. In this affirmation of the importance of the individual against the threat of envelopment in the masses, it is hard not to see a response to the growth in anonymous cities, mass produced products, and regular working hours that characterized the Industrial Revolution.

The thinker with the best claim to being the ideal-type existentialist was the French philosopher Jean-Paul SARTRE. In Sartre's work, the themes of freedom, choice, and authenticity are developed into a unified system at once metaphysical and moral. Moreover, Sartre exemplified another aspect of existentialism which cannot be overlooked: its connection to everyday life. Existentialism is for its exponents, notoriously, not merely an academic movement but a way of life. With his lifelong relationship with the feminist thinker Simone de BEAUVOIR, his numerous affairs, his support for a range of radical political movements, and his involvement in theatre and literature (he was awarded, and declined, the 1964 Nobel Prize in Literature), Sartre exemplified the existentialist as bohemian.

Sartre did not coin the term *existentialism* and at first rejected it. However, he was himself responsible for giving it broad currency, by adopting it for the title of his famous 1946 lecture "Existentialism Is a HUMANISM." Here Sartre set out his influential justification for the centrality and unjustifiability of radical choice in human life. For human beings, and them alone, Sartre argued, "existence precedes essence." Human beings, uniquely among all the entities in the universe, *are*—that is, they exist—before they *are* anything in particular, and therefore what they shall be is up to them. We do not have essences or fixed psychological characteristics; instead, we must each choose how we are going to behave. Just as Nietzsche and Kierkegaard called upon us to commit ourselves to a life which we cannot rationally or morally justify, so Sartre called upon us to create ourselves according to a pattern of own making. By rejecting the

notion of a human essence, Sartre completed the revolution begun by Nietzsche: Not only were values not to be found inscribed in nature or in the mind of a god, they were not to be found within ourselves either.

One of Sartre's most original contributions to existentialist thought was the notion of *bad faith*. Bad faith is a kind of self-deception, but it is self-deception with regard to a very specific topic: human freedom. Sartre claimed that every human being senses possession of the freedom to mold one's own life as one chooses, and that there are no values independent of one's choices, which could justify them. He argued that the sense of absolute freedom this knowledge brings is almost unbearably terrifying, and that we are all therefore tempted to deny our radical freedom. We deny our freedom by arguing either that we are not able to choose at all—by taking refuge in scientism and DETERMINISM, for instance—or by holding that our choices are uniquely justified by values independent of ourselves. When we deny our freedom, we are in bad faith. We do not simply assert or believe something that is false, but we try to convince ourselves of something we know to be false. Hence bad faith is a kind of self-deception, which is traditionally conceived as intentional self-deceit.

Religion in all its forms was, for Sartre, a paradigm of bad faith. The religious believer claims that his or her way of life is uniquely justified inasmuch as it conforms to God's plan for the universe. But bad faith can take many forms, and atheistic varieties can be found as well. The humanist who argues that human nature or the flourishing of the species (or whatever it may be) justifies humanism uniquely is equally in bad faith.

Whatever differences existed among them, existentialists were united in their stress on the individual. In postwar Europe, individualism was increasingly unfashionable as a variant of Marxism that stressed the power of social forces to determine ideas and took hold of the imaginations of intellectuals. Sartre and others struggled heroically to reconcile existentialism with Marxism, but their presuppositions were too different for the project to succeed.

When existentialism faded from the intellectual landscape, it was largely as a consequence of the vagaries of fashion. Nevertheless, and as Sartre himself came to see, the (broadly) Marxist focus on the social background of individual action exposed a genuine and seemingly intractable difficulty with existentialism: by making freedom so radical, existentialism actually made it impossible. No one is able to choose a way of life or a system of values from the ground up; this is not merely psychologically impossible, but genuinely incoherent. The very terms in which we make our choices, if they are not merely arbitrary flips of a coin, must be inherited from our social background (or innate in the human mind). A more modest freedom is the only freedom that is coherent.

Today, existentialism no longer occupies an important place in academic philosophy or elsewhere in intellectual life. Nevertheless, its central themes continue to exercise a powerful hold on the imagination of ordinary people. As Charles Taylor recently stressed, authenticity remains an unrepudiable value for us; we each believe that it is important to reject the forces of conformism and choose the life appropriate for ourselves. Existentialism, like Freudianism, has suffered defeats within academic life from which it looks unlikely to recover, yet it has triumphed more broadly by becoming absorbed into the fabric of our cultural commonplaces.

FAITH HEALING. Successes and Failures. Because learning comes by trial and error, the history of medication is one of both successes and failures. Some cultures have been more advanced than others in eliminating harmful potions. Contemporary medicine and pharmaceutical companies strive to speed the process of trial and error in laboratories in the hope of both detecting harmful side effects and generating more effective medications.

Over the centuries, desperate human beings tried whatever seemed promising in their battle against infirmities. Certain members of the community who were accepted as authorities in countering illness resorted to a variety of techniques, practices, formulas, and concoctions. Those seeking healing or relief from suffering often exercised faith in the sense of trusting in the guidance of the authorities. In some cases, the guidance proved more helpful than harmful. In other cases, its effect proved either harmful or negligible.

Having "Faith In." To have faith in someone implies believing that he or she can be relied on to do certain specific things or to be a certain kind of person under

specified conditions. In ordinary discourse, the word *faith* may or may not have a religious context. A husband who has faith in his wife as a pilot or electrician might not have faith in her as a surgeon. In each case, his faith, trust, or confidence is either justified or unjustified. We can also have faith in inanimate objects such as chairs and benches, trusting that they will not collapse if we sit on them.

For clients to have faith in the counsel of their lawyers is to heed it. If the counsel proves repeatedly faulty, clients who persist in following it are indulging in blind faith. Both trust and distrust are essential to living. The opposite of blind faith is the inability to trust when trust would be appropriate and rational. No one can live without both faith and distrust, although people may differ regarding what they trust and distrust. Some Christians have faith in faith healers whereas other Christians distrust them.

Controversy among Conservative Christians. Theological conservatives among Protestants divide sharply over the issue of miraculous cures. The first camp claims that miraculous healings occurred during biblical times only. The second camp claims not only that miraculous healings continue to this day, but also that faith-healing revivals are special outpourings of the Holy Spirit. Furthermore, some individuals are believed to possess the special gift of healing. Evangelists who regard themselves as enjoying this special "healing ministry" tend to believe they are divine instruments for casting out demons. Many of them, including Oral Roberts, tend to think that demons contribute significantly to human illnesses and diseases.

The third camp includes Protestants (and many Catholics) who regard PRAYER as an effective part of the healing process. They trust the medical profession and see prayer in especially severe cases as complementary. They tend to regard so-called faith healers as either misguided zealots who do considerable harm or manipulative and arrogant frauds. Some faith healers are accused of spreading the false and harmful doctrine that *all who truly believe will be healed while those who are not healed did not truly believe*. Many Christians of the third camp look with disgust upon televangelists who peer at the TV camera and profess to mediate healing to people they neither see nor know.

Medicine and Faith Healers. Some faith healers in the twentieth century taught their followers to place no faith in doctors. Three factors were involved. First, many of those attending the "healing revivals" lacked the funds for doctors, medication, and hospital care. The second factor was a theological doctrine according to which bodily healing was a part of salvation. Faith healers of this school referred to biblical passages portraying Jesus as effecting forgiveness and healing simultaneously. The third factor was the faith healers' personality. Many of them looked upon doctors as rivals. If healing was a miracle and if being a healer was a gift of the Holy Spirit, medical schools were institutions that propagated a rival view of healing that credited doctors, rather than God, with the healings. By implication, the doctors robbed the faith healers of their role and influence.

The Strange Case of Evangelist Jack Coe. Born in Oklahoma City in 1918, Jack Coe was perhaps the most flamboyant of the faith healers. In his vast tent, thousands arrived to witness his performances. He would lift people from wheelchairs, and if they fell, he would say they did not have faith. He relished inveighing against "the devil and his crowd." A brilliant exploiter of controversy, he found himself accused of practicing medicine without a license. In a two-day trial in a Miami courtroom, he called upon other faith healers to testify on his behalf. The case centered around the evangelist's failure to deliver the polio-stricken son of one Mrs. Clark from his affliction. Coe contended that God had explained to him that despite his faith and prayers, some people could not be healed because they did not know how to receive healing: "More people would be healed if only they knew how to accept and keep it." The judge ruled he could not "condemn the defendant or anyone who in good faith advocates and practices Divine Healing."

Ironically but not miraculously, ten months later, in December 1956, Coe fell critically ill while preaching in Hot Springs, Arkansas. Since he had been careless of his health and was severely overweight, he thought he had succumbed to exhaustion. In fact, he had fallen victim to polio. Despite his hostility toward the medical profession, he permitted his wife to satisfy her conscience by admitting him to a hospital. He died at the age of thirty-nine. A fellow evangelist complained of being prevented from praying for Coe and laying on hands, since Coe had been quarantined. Another evangelist scolded Coe's wife for not calling on him to come and raise Coe from the dead. Apparently, the latter evangelist, who claimed to have received several communiqués from the deity, had been unavailable to receive a divine message encouraging him to pray for Coe's resurrection.

Financial Healing. Within the charimatic and Pentecostal movement, some believers experimented with the gospel of prosperity. As prosperity for many in the middle class became a reality after World War II, Pentecostals could afford medical treatment, mortgage payments, automobiles, televisions, and other manifestations of affluence. As financial health emerged, a new theology developed to help believers feel comfortable with prosperity and with becoming concerned about maintaining their financial health.

Giving regular donations to "gospel ministers" became an important plank of the gospel of prosperity theology. One televangelist emphasized the "hundredfold principle" based, he believed, on Mark 10:30. His wife explained," [G]ive $1000 and receive $100,000. . . . Give one car and the return would furnish you a lifetime of cars. In short, Mark 10:30 is a very good deal." Pat Robertson, writing of "miracles involving money," tells

of a Texas oilman who contributed a sizable share of his business profits and personal income to "God's work." The man claimed to receive visions and "the word of knowledge," that is, supernatural drilling information.

Money, Medicine, and Faith Healing. Oral Roberts claimed to have heard God talk to him about building a hospital in Tulsa, Oklahoma, the city in which his organization was located. Historian David Harrell Jr., a student of the Pentecostal branch of Protestantism in America, explains, "Oral's vision, as always, was a coalescing of insights rather than a flash of revelation." Roberts appeared obsessed with building the hospital: "There's no hospital built on this earth that can do what I dream about." Against sound advice from friends with business experience, he persisted. He wanted his followers to believe in and support his vision. Some observers understood him to be driven by the need to legitimize faith healing by somehow blending it with the medical profession. Most of the middle class remained suspicious of both the motives and claims of faith healers; if Roberts could somehow bring the doctors and faith healers together in the same hospital, and if through prayer and research they could find a cure for cancer, then the skepticism about faith healers would miraculously vanish. The "primal self in the pit of his belly which he identified with the voice of God" drove him to build the hospital. The harder he drove himself, the more he became convinced that a satanic conspiracy had launched a "last-ditch move against God's work." When the inevitable financial crisis came, with its stack of debts growing taller each month, Roberts proclaimed that suddenly he felt a holy presence all around him. Upon opening his eyes, he saw standing before him none other than Jesus Christ, "a full 300 feet taller than the 600 foot tall City of Faith." Roberts needed a towering Jesus to deal with the tall stack of unpaid bills.

In his book *The Faith Healers*, James Randi, who systematically investigates faith healers, explains why the hospital venture was doomed from the start: Roberts had failed to engage in elementary marketing research. He could have learned from the business instructors at Oral Roberts University or from honest business friends in Tulsa. But he did not listen to the mere mortals because he believed he was listening to God.

Raising the Dead and Raising Money. Although Roberts more than once announced that he had frequently witnessed the dead rise at his healing services, he was unable to raise the money to keep the hospital afloat. Its financial condition had deteriorated and not even the gospel of prosperity could heal it. Eventually, the dream of the hospital died.

Another Interpretation of Faith. Among naturalists and many theists, faith is not a doorway leading into a world of magic and miracles. The human organism is physical and must constantly interact with a physical environment. Rational faith as a mode of daily living in a physical environment includes ordinary hope, trust, and commitment. In times of illness, faith and reason can combine to reinforce recovery. Faith is a way of keeping alert to practical and tested measures for maintaining health and countering sickness. Although they do not believe supernatural miracles happen, naturalists are often able to appreciate the goodwill behind one person's praying for another person's recovery. Naturalists and theists often recognize the crucial role of social reinforcers in maintaining good health. Get-well cards, kind words and deeds, caring gestures, gifts, and numerous other forms of social nurturing are aspects of both mental and physical health. Rational faith includes openness to the goodness and encouragement coming from friends and family.

In many cases, this trust or openness helps the afflicted to deal better with chronic illness. Biomedicine informs us of the laboratory aspects of illness, genetics and disease, medical ecology, the evolution of diseases, nutrition, demography, and paleopathology. Medical anthropology explores the social and cultural dimensions of illness, including the psychosocial sense of loss.

The Crisis of Loss. Illness brings loss of control over some aspect of one's body and environment. Loss of one's job or career because of illness can threaten an individual's self-identity and role in the community. Cultural anthropologists refer to the "loss of meaning" that sometimes comes with sickness. Each culture has a worldview that purports to offer some explanation of sickness. In highly anthropomorphic cultures, prolonged or severe illness often evokes the question "Why?" or even "Why *me*?" This can signify an emotional and intellectual crisis for both the afflicted and his or her family. Behind the "Why?" lies the assumption that a conscious, supernatural agent has chosen either to inflict the sufferer or to permit the illness to come about for reasons not clear to the sufferer.

With severe loss comes grief in varying degrees. Cultures and subcultures vary in their ways of dealing with grief and placing it in a wider context. In many cases, a community of family and friends helps share the grief, thus bringing needed comfort. Healing is control not only of disordered biological process, but also of psychological dysfunction and disturbing symptoms.

The Global South. Some students of religion contend that a branch of Pentecostalism, with its wild claims of healing miracles and the most cynical aspects of faith-healing ministries, will spread in the global south. Faith-healing claims will thrive where the benefits of medical research and medical technology are unavailable. Poverty and unchecked anthropomorphism are the seedbed of faith-healing revivals.

Fraud and Chicanery. In the 1980s James Randi and Joe Barnhart discovered that evangelist W. V. Grant Jr. supplied wheelchairs for individuals who came to his "healing services" an hour or so early under their own power. Seating themselves in the audience along the wall to the evangelist's left, they appeared bound to their

wheelchairs by disabling illness. During the service, Grant hurried over to them and, with microphone in hand, pronounced some of them cured by "Dr. Jesus." He then urged one of the women to rise from her wheelchair and run up the aisle, giving the distinct impression that the evangelist had been the instrument of her miraculous, instant cure.

Later, in Fort Lauderdale, Randi exposed the Grant team's practice of using crib sheets by which to collect and use information about individuals and their illnesses. Grant used specific details in a public display to give the impression that the information had come to him by divine communiqué. Randi exposed the heartless cynicism behind the deceit. He also exposed faith healer Peter Popoff's use of a tiny listening device in his left ear to receive previously gathered information from his wife. Through this deception, Popoff gave the impression that he was receiving information from heaven rather than from his wife backstage. Thanks to the tenacious Randi and his assistants, some of the most blatant deceptions practiced by some faith healers have been well documented and carefully explained. For example, as Randi reported: "Before the end of our investigation, [undercover volunteer] Don Henvick would be healed by four different healers, in six different cities, of six different diseases, under four different names and two different sexes."

Austin Miles, a Pentecostalist preacher who briefly embraced HUMANISM before returning to the Christian ministry, showed during his humanist period how the "renowned Reverend William Branham, faith healer and prophet of God, had been using parlor tricks! He was deliberately staging his supposed messages from God in order to manipulate vulnerable people."

Culturally Induced Crises and Cures. In *Sensory Deception*, Peter Slade and Richard Bentall note that culturally induced expectations reinforced by social factors can sometimes generate psychological crises, including hallucinations of the dead, ghosts, spirits, demons, and hauntings. Sometimes hallucinations play a healing role by reducing induced anxiety. In turn, their anxiety-relieving property reinforces the acceptance and frequency of hallucinations. This is especially true in cases of bereavement and loss of a loved one or a highly significant object.

A similar self-fulfilling cycle can be observed in orthodox Christianity. The orthodox culture inculcates acceptance of original sin and its accompanying sense of guilt, which in some cases becomes pathological. To create a need for their professed healing or cure, theologians not only invented the notion of original sin, but also labeled it as a disease of the soul, heart, and mind. Having induced guilt as the cause, the same orthodox culture then offers a putative cure, which purports to restore the believer to a state of forensic guiltlessness, provided the believer acknowledges the vicarious atonement that is reputed to remove original sin.

JOE EDWARD BARNHART

FALSIFIABILITY. In *Objective Knowledge* Karl POPPER states, "Instead of discussing the 'probability' of a hypothesis we should try to assess what tests, what trials, it has withstood; that is, we should try to assess how far it has been able to prove its fitness to survive by standing up to tests."

Empirical Method. The empirical method characteristically exposes to falsification, in every conceivable way, the system to be tested. Since the same collection of data often appears to support rival theories or systems of theories, one task of science is not to protect this or that system, but to test the most promising ones rigorously and to conclude which is, by comparison, the fittest. If the *goal of science* is to create the best system of theories about the real world, then great theories need not only to be enriched

with depth and scope of content, but also to be well articulated. The better theoretical systems *say* more, and predict with greater scope and precision. "It will rain or not rain tomorrow" is not refutable or falsifiable because it says nothing. Since it purports to offer no positive information, it cannot clash with what purport to be observation statements. Science generates bold hypotheses with deductive consequences that must be spelled out so that they can be subjected to thorough criticism.

Risking Refutation. All scientific theories risk trials. In the attempt to improve their theories or to replace them with better ones, scientists consciously search for errors and mistakes. Rigorous experiments are designed to make the investigation more critical and severe. The higher the theory's informative content, the greater its risk. A theory with rich content and scope that eventually becomes falsified can advance knowledge better than can a thin theory that has not risked refutation. By discovering where and how elements of a theory have been falsified, researchers sometimes discover ways to create a better theory.

A scientific theory does not purport to explain everything that could possibly happen. Rather, it rules out most of what could possibly happen. If what it rules out does happen, the theory, or some aspect of it, has been refuted. The more a theory says, the more it rules out. "Laws" of nature do not guarantee or enable; they prohibit.

A scientific theory's testability grows with its degree of universality and its degree of definiteness, or precision. The larger the range of events about which the theory can venture predictions, the more falsifiable the theory becomes. That is, its testability increases. Great advances in science require, therefore, bold, risk-taking theories. A vague theory runs few risks of being either false or profound. While it might be trivially true, it will not open doors to new empirical discoveries or help resolve what Thomas Kuhn calls scientific "puzzles."

Explanation and Prediction. A new hypothesis is better than another if it explains all that the old hypothesis successfully explained and avoids some of the serious errors of the old hypothesis. It must do the latter not by retreating to vagueness but by submitting to and withstanding some of the most critical tests. Scientists give added weight to a new hypothesis that also makes definite, bold, and fruitful predictions that give promise of being refutable.

No theory exists in isolation. It gains meaning and significance within a network of other hypotheses (Quine's "web of belief"). Its explanatory power increases if it integrates with other fruitful, falsifiable theories. In the case of fecund scientific revolutions, a new coalition of bold new theories forms a new web of interconnection that provides greater explanatory power.

Intensifying the Testing Process. Awareness of falsifiability may generate fear of chaos in a society where there is little awareness of alternative views. In some respects, where falsifiability is openly tolerated, alternatives are more likely to emerge. Science may be viewed as rational thinking that is intensified. Instead of waiting for events to come along that might challenge a hypothesis, science designs experiments to speed up the process. By creating new experimental situations, science runs ahead of the natural pace. Ideally, it becomes an institution that liquidates theories rather than the persons who articulate the new theories.

Simulated Falsification. Although not all rational discourse can be tested empirically, simulated falsifiability can apply in metaphysics. Behind falsifiability is the detection of *contradictory* statements and claims. In metaphysics, statements can be spelled out and compared with other carefully articulated statements. Even when empirical testing seems impossible or difficult to implement, rational discourse may nevertheless be possible. Doctrines or theories may be articulated in the interest of making them say something definite that can be logically analyzed and compared with rival doctrines purporting to refer to some aspect of reality.

Everyday Testing. Falsifiability has a constructive function in therapy, engineering, plumbing, the applied sciences, and daily living. When beliefs are acted upon, the expected consequence may at times fail to materialize. All societies that survive for a long time have learned to make at least some crucial revisions, and in some cases replacement of some beliefs with others. Some beliefs prove lethal if acted upon. Others appear to belong to an imaginary realm where falsifiability can be safely ignored or handled with more purely imaginary adjustments. Yet even in an imaginary narrative, vast areas of possibilities are ruled out. That is, not every claim can be accepted as belonging to the story. Internal contradictions beyond a certain point will turn a story into disjointed episodes at best.

Religions have invented stories with claims that the gods require special kinds of sacrifice that rule out other kinds. These stories cannot be regarded as empirical claims, however, because no definite tests can be designed and enacted to determine the gods' preferences. In religious traditions, attempts have been made to connect divine preferences with publicly observable or natural phenomena. When the consequences fail to materialize as predicted, the adjustments to account for the accumulated anomalies may not integrate coherently with its primary web of beliefs. In genuine scientific experiments, researchers must keep careful records of the predicted consequences and the adjustments made in either the experiment or the relevant theory. In short, when scientists design rigorous tests, they keep careful records for the purpose of determining the cognitive price paid in making theoretical adjustments when some aspect of the theory appears falsified.

Theology and Simulated Falsification. When a religious tradition's storytelling generates mutants with new claims, the accompanying theology must produce revisions and, in the process, develop its own standards

(canons) for determining which claims and theories to accept and which to rule out. Simulated falsification occurs as theologians detect internal conflicts and problems within the evolving story. When believers expand the story by attempting to make more or less precise contact (including predictions about) with the natural world, theologians are forced to deal with the religion's falsified claims by either revising the problematic doctrine/theory or generating new ad hoc doctrines. The history of Christian doctrines of the Trinity, for example, is the history of (1) theories that encountered simulated falsification and (2) the revisions or replacements purporting to overcome the contradictions. In *When Prophecy Failed*, Robert P. Carroll deals with (1) the problems encountered in reinterpreting falsified prophecies and (2) the practice of avoiding dissonance by shifting prophecy into highly metaphorical language. Among snake-handling fundamentalists, when a poisonous snake bites and kills an occasional believer, the surviving believers need not take the death as falsification of either Mark 16:18 or the insufficiency of the victim's faith. Rather, the believing survivors may make an ad hoc adjustment by reinterpreting the death as God's way of calling his servant home. This shifts the discourse to the realm of the metaphorical. Stated perhaps more simply, the believers *equivocate* regarding Mark 16:18's prediction that if they take up serpents, they will not be injured.

Narratives for Living. The human species lives partly by a variety of stories, narratives, or accounts of what people regard as aspects of reality relative to their lives. When some of the accounts do not correspond with the relevant facts, adjustments often become necessary. Therapists may deal with clients who either cannot make adjustments or make adjustments that do not work. Much of therapy includes teaching clients the skill of (1) admitting that some of the beliefs they are acting upon have been falsified and (2) generating revised or new beliefs that can be acted upon without the problematic consequences.

In *Bargains with Fate*, Bernard J. Paris draws from Shakespeare and Karen Horney's insights into the failure to acknowledge elementary falsifiability in certain critical expectations. Horney taught her clients to detect their *inconsistencies* and to deal with them. Great suffering and sometimes tragedy develops from the inability to change behaviors that proceed from expectations that cannot be fulfilled in the real world.

Human beliefs, hypotheses, theories, and expectations function as prophecies or predictions. Daily living operates by betting on them. The crucial role of falsifiability is that of acknowledging when, where, and how important predictions have failed. Learning comes partly through recognizing mistakes and creating new beliefs and actions that do not repeat the mistakes. Denial is one way of dealing with a prediction that has suffered refutation. Self-delusion is another way. When, in self-delusion, we more or less recognize that our belief prediction has failed, we may develop other beliefs that help us to avoid testing (and thus accountability) by giving way to an obscurantism that allows us to take refuge in haziness or concealment. Much of therapy (whether through professional counselors, friends, or reading material) is a process of reducing some of the haziness of thought and language. If the unconscious is the habit of thinking obscurely and, in some cases, cryptically (as in so-called schizophrenia), rational thinking is a process in which implicit beliefs become sufficiently explicit for our analyzing them. *Analysis* in this context is a conscious explication of beliefs by (1) specifying the predicted actions implicit in the beliefs and (2) becoming more accurate and precise in observing their impact on the actor, on others, and on the most relevant aspects of the environment. Sensitivity to falsifiability can become so well developed that it becomes second nature or subconscious, as when a driver quickly anticipates a mistake and corrects it without having to verbalize either the mistake or the correction. Much of what is called "intuition" is probably a quick detection and overriding of plans or theories that will not work (i.e., either would be falsified or would fail to develop sufficient precision for testing). The quick detection often frees the mind to focus on other plans or theories that exemplify a promising degree of definiteness and fruitfulness.

JOE EDWARD BARNHART

FARBER, MARVIN (1901–1980), American philosophical naturalist. Educated at the University of Buffalo and at Harvard, Marvin Farber studied in Germany with Edmund Husserl, Ernst Zermelo, Heinrich Richert, Karl Jaspers, and Martin Heidegger before completing his Harvard PhD in 1925 with a dissertation titled "Phenomenology as a Method and as a Philosophical Discipline." Committed to logic and radical social philosophy, he wished to combine the rigor of mathematics with the materialism (see MATERIALISM, PHILOSOPHICAL) of MARXISM. Although he became the preeminent American authority on Husserl, he rejected the idealism in Husserl's later work and was critical of many of Husserl's disciples, most vehemently of Heidegger. His classic study of Husserl, *The Foundation of Phenome-*

nology: Edmund Husserl and the Quest for a Rigorous Science of Philosophy, was published in 1943.

Farber taught almost his entire career at the University of Buffalo (after 1962 called the State University of New York at Buffalo). An atheistic Jew, he aided many European intellectuals in coming to America to escape Nazism.

Farber founded in 1940—and edited until his death forty years later—*Philosophy and Phenomenological Research* (PPR), a quarterly intended to foster the most scientifically descriptive, logically rigorous, and socially beneficial philosophy. PPR was also the most pluralistic and international philosophical journal of its time. During the Cold War Farber edited (with R. W. Sellars and V. J. McGill) *Philosophy for the Future: The Quest of Modern Materialism*, a book that made his sympathies with Marxism widely known. In 1959 he published his most important work of original philosophy, *Naturalism and Subjectivism*, in which he formulated a naturalism that sought to improve on the American tradition of NATURALISM (such as the philosophy of John DEWEY) by incorporating phenomenological method and elements of Marxism. These themes were further developed in a manuscript that he completed before his death, *The Search for an Alternative: Philosophical Perspectives of Subjectivism and Marxism.* Although in earlier publications he had used the words "naturalism" and "materialism" interchangeably, in this final work only "materialism" was used "to name a philosophy of man and natural existence which is science-oriented in the broadest possible way and includes in its scope the recognition of social conflicts and the motivation for change." He praised the materialism of "uncompromising honesty" found in the work of Vladimir Ilyich LENIN, but warned Marxists against the overextension of the dialectical method. He insisted that the transcendental method of phenomenology was equally important, though it, too, must not be overextended. Farber's continuing commitment to mathematical logic also found a place in his "materialistic phenomenology." He argued that mathematics and formal logic, like phenomenology, could lay bare structures and features of experience otherwise inaccessible.

PETER H. HARE

FARMER, JAMES (1920–1999), American civil rights activist. Born in Marshall, Texas, on January 12, 1920, James Farmer was a cofounder of the Congress of Racial Equality (CORE) and spent much of his life as a civil rights activist, educator, and administrator. Raised in an environment in which education and religious faith were valued, Farmer was an outstanding student. At the age of fourteen he entered Wiley College in Marshall, Texas. Graduating in 1938, Farmer went on to Howard University's School of Religion, from which he graduated in 1941. Farmer opposed war in general; when the United States entered World War II later that year, he applied for conscientious objector status but found that he was deferred from the draft because he had a divinity degree. Farmer objected specifically to the prospect of serving in the segregated ranks of the US military in a fight against fascism.

Rather than become an ordained Methodist minister, Farmer chose instead to go to work for the Fellowship of Reconciliation (FOR), becoming that organization's secretary for race relations. In that position, Farmer helped the Quaker pacifist organization develop its responses to such social ills as racial prejudice, war, violence, and poverty. It was a job that left Farmer enough time to begin forming his own approach to these issues, one based less on FOR's Quaker pacifism than on the principle of nonviolent civil disobedience.

Farmer and several Christian pacifists founded CORE in 1942 with the express purpose of using Gandhian tactics of nonviolent civil disobedience in order to apply direct challenges to American racism. Farmer's religious beliefs resulted in his refusal to serve in the armed forces during World War II. In 1947 he participated in CORE's campaign of sit-ins, which successfully ended discriminatory service practices against African Americans at

two Chicago restaurants. An articulate and charismatic figure, Farmer became CORE's national director in 1961, which enabled him to help organize student sit-ins and Freedom Rides across the Deep South.

In 1966 Farmer saw that CORE was drifting away from its Gandhian roots and decided to leave the pioneering civil rights organization. Always an active writer and speaker, he continued to direct a national adult literacy project lecture publicly on civil rights and eventually took a teaching position at Lincoln University in Pennsylvania. Running as a Republican, Farmer failed in an attempt to win a New York congressional seat in 1968, running against Shirley Chisholm. Shortly afterwards, the new president, Richard Nixon, appointed him assistant secretary of Health, Education and Welfare. After leaving Nixon's administration in 1971, Farmer worked for the Council on Minority Planning and Strategy, an African American think tank. In his final years Farmer completed his autobiography, *Lay Bare the Heart* (1985). James Farmer was awarded the Congressional Medal for Freedom by President Bill Clinton in 1998. He died a year later on July 9, 1999.

JUAN FLOYD-THOMAS

FERRER GUARDIA, FRANCISCO (1859–1909), Spanish anarchist educator. Francisco Ferrer Guardia's Barcelona Escuela Moderna (1901–1906) influenced many Spanish secularist and radical schools. His execution for allegedly instigating the July 1909 Barcelona riots inspired international liberal, rationalist, and socialist protests recalling the Dreyfus case.

Early Life. Ferrer was born on January 10, 1859, at Alella, near Barcelona. His parents were conservative Catholics, but Ferrer became a zealous atheist, anticlerical (see ANTICLERICALISM), and republican in his teens. He fled to France in 1886 after participating in several Spanish republican uprisings in the 1880s.

Paris Years. Ferrer lived in Paris from 1886 to 1901, teaching Spanish and meeting French and European liberals, rationalists, socialists, and anarchists. His republicanism deepened into socialism and eventually anarchism, becoming convinced of the need to educate the masses to achieve lasting social change. When a wealthy Spanish language student left him her fortune, he used it to establish the Escuela Moderna.

The Escuela Moderna. Ferrer opened the "Modern, Scientific, and Rational School" in Barcelona in September 1901. It was coeducational, antireligious, antimilitary, and antistate, without punishment, competition, or examinations. Ferrer also ran a publishing house, which published a monthly, *Boletín de la Escuela Moderna* (1901–1906, 1908–1909), on educational theory. He published cheap books on reading, grammar, science, history, ethics, and sociology, mostly translations of foreign secularist and anarchist works. Many Spanish secularist and workers' schools adopted Ferrer's methods and textbooks, inspiring rumors of Ferrer "endowing" them. Similar schools using Ferrer's books also arose in Portugal, Latin America, and elsewhere.

The authorities closed the Escuela Moderna after Mateo Morral Roca, a former manager of Ferrer's publishing house, attempted to assassinate King Alfonso XIII on May 31, 1906. Morral committed suicide, but Ferrer was arrested on suspicion of complicity. He was tried a year later, in June 1907, but acquitted for lack of evidence. After his release, Ferrer was not permitted to reopen the Escuela Moderna.

Last Years. Ferrer returned to Paris in 1907, founding the International League for the Rational Education of Children. In 1908 he began an education journal, *L'École Renovée*, and also resumed his *Boletín de la Escuela Moderna*. Ferrer's old interest in Spanish anarcho-syndicalism also revived. In June 1909 he returned to Spain to visit sick relatives.

The Tragic Week. In July 1909, protests against a Spanish military expedition to Morocco led to the "Tragic Week" in Barcelona. Republican extremists escalated a Socialist general strike into anticlerical rioting. Blaming religious orders with an interest in Moroccan mines for the expedition, Barcelona mobs burned churches and convents from July 26 to July 30, before order was restored.

Ferrer's Execution. Ferrer was arrested on September 1 as the suspected organizer of the insurrection. On October 9 he was tried, convicted, and sentenced to death in a military trial. Violently revolutionary statements from his past writings were added to the testimony of witnesses claiming to have seen or heard him speaking with rioters and republican extremists. Ferrer was executed by a military firing squad at Barcelona on October 13.

International Protests. Ferrer's execution sparked worldwide protests by liberals, rationalists, socialists, and anarchists hailing him as a martyr for intellectual freedom. Liberal and socialist newspapers attacked the execution as a "judicial murder." European intellectuals signed manifestoes denouncing the execution. Protest meetings, processions, and strikes were held in cities throughout Europe and the Americas. Many European cities renamed streets for Ferrer. In Spain opposition leaders invoked the protests in the government crisis bringing down Antonio Maura's Conservative government. In the United States, Ferrer was commemorated by "modern schools" modeled on the Escuela Moderna, some surviving into the 1950s.

FEUERBACH, LUDWIG (1804–1872), German humanist and religion critic. Although Ludwig Feuerbach began his career as a metaphysical idealist, he became an aggressive critic of both it and Christianity and ended his career as a proponent of a humanism based on "sensuousness" and the solidarity of I and Thou. His best-known work was *The Essence of Christianity* (1841).

Life. Feuerbach was the fourth child in a distinguished German family. Originally intending to study theology in Heidelberg, he became enchanted by Hegelian idealism and switched to Berlin in order to study philosophy with Hegel. In his first academic position he quickly established a reputation as a rising young philosopher, but his career was prematurely aborted when it was discovered that he was the anonymous author of *Thoughts on Death and Immortality* (1830), which attacked the notions of a personal god and personal immortality. Unable to find employment in a German university, he retired to a small town near Ansbach, where his wife's father owned a porcelain factory.

His book *The Essence of Christianity* (1841) created a sensation, and he became one of the leaders of a group of radicals called the Young Hegelians, who were dedicated to democracy and the separation of church and state. Between 1842 and 1848 he drafted several documents enunciating the principles of a new HUMANISM. Regarded by the German students as a hero, he was invited to lecture at the University of Heidelberg in 1848 but was denied university facilities and forced to use the city hall. Disillusioned by the failure of the revolutions of 1848, he retreated back to his porcelain factory. When it went bankrupt in 1859, he was forced to move to a small town near Nürnberg, where, ill and virtually penniless, he lived out his life with the financial aid of friends.

The Critique of Religion. Feuerbach's earliest writings were in the tradition of German idealism, in which both nature and spirit are regarded as aspects of one infinite spirit. But in the 1830s he began rethinking his position, which culminated in a published attack on G. W. F. Hegel in 1837. The publication of *The Essence of Christianity* created a sensation not only because of its radical interpretation and repudiation of Christianity but because Hegelian categories were employed to accomplish it. Hegel's metaphysics was based on the notion that the Infinite Spirit perpetually pours out or objectifies its life in the finite and struggles with the resulting externality (self-alienation) until finally overcoming it in self-knowledge. Feuerbach, by contrast, argues that it is the human spirit that comes to self-consciousness in and through its objectification in the idea of God. In the process of differentiating itself from other selves, the self, or I, becomes aware that it is a member of the species with certain predicates. These predicates are naturally regarded as perfections, and the imagination seizes on them and under the pressure of wish converts the idea of the species into a perfect individual subject. The Christian idea of a deity possessing perfect reason, moral integrity, and love is simply the most advanced idea of humanity's essential nature.

In the first part of the book, Feuerbach took up the various doctrines of Christianity in order to show that they are really a mystified anthropology. His aims were to account for the form of the doctrine, to exhibit the contradictions that result when it is taken seriously as theology, and, finally, to exhibit what he called "the characteristic illusion of the religious consciousness," the illusion that attributes everything to God and nothing to humanity. In the second part Feuerbach attempted to show how the projection of human predicates onto the divine results in conceptual confusion and alienation.

As Feuerbach became critical of idealism and moved toward a naturalistic empiricism, he tended to drop the Hegelian emphasis on consciousness objectifying itself and argued that the origins of religion are rooted in the encounter with nature. In his *Lectures on the Essence of Religion* (1848), he wrote that the human person is an embodied sensuous being immersed in a field of forces that impinges on it from within and without and upon which it is absolutely dependent. In primitive times, these natural forces struck human beings with emotional force and the imagination seized on these qualities and personified them. The result was polytheism. As civilization developed and nature was conceived of as a unified whole, the result was monotheism. But in both cases, human dependency and the desire for happiness results in personifying nature into a being that can be propitiated and grant that desire.

Whereas in *The Essence of Christianity* Feuerbach had argued that the concept of a transcendent being alienates the human being from its own attributes, here he described Christianity as a disorder of the desires. Christians really want to exceed the limits that nature places on human life and which make it possible. Consequently, they identify their faith with belief in the miraculous and, above all, with belief in an eternal existence free of necessity.

The New Philosophy. Although Feuerbach was preoccupied with religion, this was but the negative side of what he called his new philosophy. Unfortunately, he was never able to put this new philosophy into a fully developed and coherent work. Nevertheless, some major themes may be described. Against idealism, he argued that one cannot make the ego the basis of certainty. Rather, the new philosophy claims that certainty is only given through "sensuousness" and this, in turn, is mediated by the body. The human body is the way in which the human self is in the world and this body has its own unique constellation of senses for mediating that world. Each sense has its own special need for satisfaction. Nevertheless, the human organism is a "universal being," which is to say that any given sense is elevated by consciousness above its bondage to its particular need. Consequently, the philosopher must think in harmony with the senses and this requires dedication to the concrete rather than the abstract.

Feuerbach was never able to complete the ethics of his new philosophy and what he did write leaves many questions unanswered. Nevertheless, it seems founded upon two basic principles: (a) self-consciousness only emerges in relationship to another self-consciousness, so that only the social person is a person; and (b) every living organism is in the grip of a drive toward self-fulfillment. This drive is the aggregate of all human drives, needs, and predispositions, and the function of reason and will are to direct these drives in the interest of the entire organism. This drive to happiness is not itself subject to moral judgments but is, rather, the presupposition of any theory of morality. Morality arises only when one considers the effects of one's actions stemming from the drive to happiness upon others.

VAN A. HARVEY

FICHTE, JOHANN GOTTLIEB (1762–1814), German idealist philosopher. Johann Gottlieb Fichte was born in Rammenau, Saxony, on May 19, 1762. Although the son of poor ribbon weavers, he studied at several exclusive schools, including the Pforta preparatory school and the universities of Jena, Wittenburg, and Leipzig, due to the charity of the Baron Ernest Haubold von Miltitzs. After his patron's death, Fichte struggled as a tutor for privileged children. He would remain chary of unmerited authority: a quixotic, temperamental, but earnest soul. Originally a fatalist, Fichte converted to transcendental idealism after discovering that Immanuel KANT's philosophy reconciled the naturalism of his "head" with the moralism of his "heart." His philosophy, *Wissenschaftslehre* (Theory of Scientific Knowledge) or the "first philosophy of freedom," would reflect an abiding commitment to scientific rigor, moral responsibility, and social justice.

Fichte's first book, *Attempt at a Critique of All Revelation* (1792), helped him to gain a position at the University of Jena, which allowed him to marry his long-suffering fiancée, Johanna Rahn, who later bore his son, Immanuel Hermann. In Jena Fichte established himself as a beloved educator and luminous mind, but also a divisive personality. In crowded lectures, the dynamic professor incited talented youth such as Friedrich Hölderlin and F. W. J. Schelling to think independently. His predecessor, the celebrated K. L. Reinhold, lauded his original interpretation of transcendental philosophy. Nonetheless, conservative foes hounded Fichte with allegations, ranging from disrupting public worship to fomenting insurrection, based on misinterpretations of his lectures and writings. The enlightened Duke Karl-August of Weimar, who had authority over the University of Jena, usually disregarded these specious claims, but Fichte eventually lost his position as a result of accusations of ATHEISM, which initiated the Atheism Controversy of 1798–99 (see CONTROVERSIES: ATHEISM, PANTHEISM, SPINOZA).

In 1798 Fichte published "On the Basis of Our Belief in a Divine Governance of the World." In this essay he denied traditional arguments for a deity, defining *God* as the moral world order or law-governed spiritual realm. Fichte claimed that true religion is not concerned with venerating deities but rather with performing one's duty regardless of the consequences. Moreover, atheism consists in shirking one's duty for the sake of reward or punishment. Because "Divine Governance" was written for

philosophers, it remained obscure until the appearance of a mawkish pamphlet wherein an anonymous author warned impressionable youth to eschew Fichte's atheism. This initiated a veritable pamphlet war between Fichte's friends and foes. The literary mêlée attracted the attention of Friedrich-August, prince-elector of Saxony, who banned "Divine Governance" and threatened to withdraw all Saxon students from Jena.

The Saxon ban scarcely concerned Duke Karl-August, but the threat required his delicate response, so he prepared an obligatory admonition to placate Saxony. Had Fichte suffered this rebuke in silence he might have weathered the Atheism Controversy, but he was truly offended because he was no atheist, by his own definition. In haste, he mailed a letter to Duke Karl-August at the Weimar Court, swearing to resign if censured. Equally affronted, the duke sent the prepared reprimand with a postscript accepting Fichte's resignation. Two student petitions containing hundreds of names were sent to Weimar on Fichte's behalf, but Karl-August held firm. Fichte fled to Berlin, where he published *Vocation of Man* (1800) and "Way Towards a Blessed Life" (1812).

In *Vocation* and "Blessed Life," Fichte developed the religious theory nascent in "Divine Governance." Particularly, he elucidated the moral world order, arguing that human consciousness transcended sensible awareness to include spiritual awareness evoked by free interaction between social beings. He remained true to his original idea that genuine religiosity involved steadfast pursuit of moral perfection rather than concern for worldly or otherworldly consequences. Fichte anticipated that readers would construe these works as signifying his reconciliation with orthodox religion, but he explicitly denied such an interpretation.

While nursing Prussian soldiers wounded in the war against Napoleon, Fichte's wife, Johanna, became ill and infected her husband. Johanna survived the fever, but Fichte died in 1814. Their son dedicated his life to editing and defending his father's work.

YOLANDA ESTES

FIELDING, WILLIAM JOHN (1886–1973), FREETHOUGHT writer. William John Fielding was born in Port Oram (later renamed Wharton), New Jersey, on April 10, 1886. His mother died when he was six, and he was educated through the eighth grade before quitting to work as a blacksmith in his father's shop at age fourteen. His father moved the family, and Fielding found work for a time on a crew of "sandhogs," men cutting a railroad tunnel under the Hudson River in Jersey City.

Fielding decided that he needed to return to school and went to business school to learn typing and clerking. Eventually he applied and became a correspondent (clerk) for Tiffany and Company. Fielding worked at Tiffany's for fifty-four years, and worked his way up to the position of executive secretary. He also became secretary-treasurer of the Louis Comfort Tiffany Foundation.

Fielding had interests in writing and poetry, and began attending lectures on the various social sciences. His interest in socialism led him to meet Emanuel HALDEMAN-JULIUS, the socialist and freethinker who had founded a nationwide publishing empire. Fielding eventually wrote thirty pocket-sized Little Blue Books for Haldeman-Julius Publications, including titles on psychology and sexology. According to Haldeman-Julius, the books on sex were his best sellers, and Fielding became known as "Tiffany's Sexologist." As a result of his research in connection with these books, he became closely tied to the birth control movement (see BIRTH CONTROL AND UNBELIEF) and made the acquaintance of Margaret SANGER.

Fielding wrote a number of books, but his most famous work is *The Shackles of the Supernatural.* This work was originally published by Haldeman-Julius Publications as a Big Blue Book, but was enlarged and republished in 1969. In the introduction, atheist leader Joseph LEWIS describes the work as "one of the most vital and essential books of our time." The book shows the damaging effects organized religion has exerted on humanity, and it should be one of the cornerstones of any collection of books on unbelief.

Fielding also wrote and edited a number of periodicals during his life. Many from his early years were socialist works. He also edited or wrote for a number of freethought publications, including *PROGRESSIVE WORLD*, *Age of Reason* (published by the Freethinkers of

America), the *Freethinker* (London), and the *American Rationalist.*

Fielding was a tireless worker for a number of groups, including the Thomas Paine Foundation, the American Ethical Union, and the Freethinkers of America. He died on December 20, 1973.

FINE-TUNING ARGUMENT See **Anthropic Principle, the.**

FINLAND, UNBELIEF IN. Finland is not a part of Scandinavia; it lies between Scandinavia and Russia. It was a colony of Sweden between 1200 and 1809 and a part of Russia between 1809 and 1917. Since 1917 Finland has been independent. The first Finnish association to discuss the philosophy of the Enlightenment (see Enlightenment, the, and Unbelief) was the Valhalla Association (1781–86). At that time, Finland was a part of Sweden, and there was no freedom of belief. Foreign books on related topics were held at two locations. The Monrepo estate had books of Julien Offray de La Mettrie, Paul-Henri Thiry (Baron) d'Holbach, and Claude Adrien Helvétius. The Fagervik estate held books of Denis Diderot. The best-known atheist in Finland at this time was Johan Kellgren, who was a clear atheist and supported a hedonistic moral code.

In 1809 Finland became a part of Russia. The situation regarding religious freedom changed little. The official religion was Lutheran Christianity, but the Eastern Orthodox Church became the other accepted church. Anders Chydenius and Robert Lagerborg wrote on freedom of religion in 1863.

Shortly afterward, Darwinism reached Finland (see also Evolution and Unbelief), and Nils Nordenskiöld discussed the new theories in the *Literary Magazine.* The first attempt to acquaint the masses with Charles Darwin's ideas occurred in 1889 in the city of Jyväskylä, where the newspaper *Keski-Suomi* published popular articles on Darwinism written by well-known individuals such as Juhani Aho and Minna Canth. The editor of *Keski-Suomi* was Eero Erkko, whose grandson Aatos Erkko would become the richest man in Finland.

The Association for Freedom of Religion and Tolerance (*Föreningen för religionsfrihet och tolerans in Finland*) was founded by Viktor Heikel and Mathilda Asp in 1887–88 but quickly suppressed by the economic department of the senate. Some of the members of this association were religious. The first issue of its journal *Free Thoughts* (*Wapaita Aatteita*) was published in 1889 but czarist censorship put an end to it as it did almost everything else. Also notable was the Raketen Club (1896–1900), a forum where the ideas of Georg Morris Cohen Brandes and Friedrich Nietzsche had notable influence. One member of this club was Rolf Lagerborg, a philosopher and author who fought the church on questions concerning morality and equality between the sexes. The most rebellious of Edvard Westermarck's disciples, Lagerborg had a turbulent academic career. His two dissertations on moral philosophy were rejected in Finland, but French versions were subsequently approved at the Sorbonne. Lagerborg studied moral philosophy, epistemology, and psychology, and was the first exponent of behaviorism in Finland. Theologians vehemently opposed his professional advancement because of his opinions, and because of his participation in the Prometheus Student Association (*Ylioppilasyhdistys Prometheus,* 1905–1914), Lagerborg never attained a professorship. He was a contributor to the literary and art magazine *Euterpe* (1902–1905), which promoted secularist ideals.

The Prometheus Student Association was established in 1905. Its chairman was Edvard Westermarck, professor at the universities of London and Helsinki and the founder of Finnish sociology. His most important work is the gigantic *The Origin and Development of the Moral Ideas*, considered by Finnish philosopher Georg Henrik von Wright the most important philosophical work ever written by a Finn. Westermarck was a Finnish social anthropologist and scholar whose area of specialization was the history of marriage, morality, and religious institutions. Westermarck gained international fame with his doctoral thesis, "The History of Human Marriage," which was inspired by the ideas of Darwin. It argued that contrary to then widely held ideas, there was no matriarchal stage of human development and that early humans were not universally promiscuous. The study appeared first in 1891 and later in three volumes in 1922.

The school of social anthropology Westermarck created was the best known in the world in the early twentieth century. Westermarck's life was devoted to science and enlightened freethought. His naturalistic criticism of religion became a guiding influence, especially among academic youth. Westermarck headed the Prometheus Association during the entire period of its activity, from 1905 to 1914.

Another member of the Prometheus Association was Rafael Karsten, who held the post of professor of practical philosophy at the University of Helsinki, from 1922 to 1948. Karsten wrote several books on anthropology

and the science of religion, as well as many reports on his extensive travels.

The journal *Free Thought* (*Vapaa Ajatus*) was published by S. E. Kristiansson from 1909 until his disappearance during or after Finland's civil war. Alfred Bernhard Sarlin wrote many books under the pseudonym "Asa Jalas." Both Kristiansson and Sarlin spent time in jail for BLASPHEMY.

Finland's civil war, in the wake of the collapse of czarist Russia brought on by the Bolshevik Revolution, was a catastrophe for atheists in Finland. Most freethought leaders were murdered by the anti-Bolshevik White Guard, including perhaps Kristiansson, whose fate was never determined.

Finland's first law providing for freedom of religion was enacted in 1922, but it was no more than a compromise between the church and political parties. The first freethinkers' association after the civil war was organized in 1927; the oldest freethinkers' organization still existing was established in the city of Kotka in 1929. The Union of Freethinkers of Finland (originally called the Union of Civil Register Associations, *Suomen Sivilirekisteriyhdistysten keskusliitto*) was founded in 1937. The latter was sharply attacked by the church, and Interior Minister Urho Kekkonen (later prime minister and president of Finland) tried to stop it. At his order, the city court of Tampere suppressed the local freethinkers' association in 1937. But the union survived and became a member of the World Union of Freethinkers in 1946.

About twenty-five union associations still exist with about fifteen hundred dues-paying members. The union publishes the magazine *Free Thinker* and maintains seven cemeteries where secular burials take place. It receives financial support from the government of Finland. Several independent freethought, humanist, and atheist organizations also exist.

In spite of the adoption in 2000 of a new constitution, which formally guarantees the freedom of religion and conscience, there is no real freedom from religion in Finland. The human rights of atheists are violated in the schools, and in some areas of the country the situation is becoming worse.

ERKKI HARTIKAINEN

FREE-LOVE MOVEMENT AND UNBELIEF. See **SEX RADICALISM AND UNBELIEF.**

FOOTE, EDWARD BLISS (1829–1906), American birth control educator and sex radical (see BIRTH CONTROL AND UNBELIEF; SEXUAL VALUES, IMPACT OF UNBELIEF ON; SEX RADICALISM AND UNBELIEF). Edward Bliss Foote was the most important American writer on contraception in the last half of the nineteenth century. Born in a village near Cleveland and raised as a Presbyterian, as a young man Bliss was influenced by the radical Unitarians who founded the Free Religious Association. He contributed money to *THE TRUTH SEEKER*, founded in 1873 by the freethinker D. M. BENNETT, and became a spokesman and advocate for FREETHOUGHT.

Foote started out as a printer's apprentice, became a compositor, and for a time edited a paper in New Britain, Connecticut. From there he moved to New York as associate editor of the *Brooklyn Morning General*. He then went on to study medicine, graduating from the University of Pennsylvania in 1860. After practicing briefly in Saratoga, New York, he moved back to New York City. Even before getting his medical degree, Bliss had written the book *Medical Commonsense*, in which he mentioned the best ways to control reproduction. He refused to discuss the methods, but told his "married" readers to write him, enclosing one dollar as well as information about their "temperaments," and he would send the information. Apparently emboldened by the replies he received, he revised the book and in his 1864 edition he added a long section on reproductive control and sexual physiology. He gave somewhat lengthy descriptions of four contraceptives that he claimed he had invented, including a "membranous envelope," a type of condom made from fish bladders; the "apex envelope," a penis cap of hard rubber; a "womb veil," a diaphragm made of rubber; and an electromagnetic preventive machine that Foote claimed prevented conception by altering the partner's electrical current during intercourse. The first three were probably somewhat effective, but the last one emphasizes just how much "quackery" was part of the practice of many physicians of the time. Bliss sold condoms for three to five dollars a dozen, while the womb veil cost six dollars. With the passage in 1873 of the Comstock Act (see COMSTOCK, ANTHONY, AND UNBELIEF) forbidding dissemination of information on contraception, Foote ceased publication of the book and instead published a new version titled *Plain Home Talk*, which was revised several times under a variety of titles before he died. This volume contained no contraceptive information but instead advised "married" readers that they could obtain an important pamphlet on the topic for ten cents, either by dropping by Foote's office or by writing him for a copy. The pamphlet, originally titled *Confidential Pamphlet for the Married*, and later simply *Words in Pearl* because it was printed in Pearl Type, included updated versions of his earlier pamphlet. In it he gives one of the earliest references to the newly developed latex rubber condoms.

Bliss was arrested in 1874 for violation of the Comstock Act, was convicted of distributing obscene material, and fined five thousand dollars. In spite of this he continued to publish his guides, but distributed them differently. He opened a Sanitary Bureau near his office that became a distibuting point for his publications. His wife, Dr. Mary Bond Foote, was also a lecturer and crusader for birth control, and one of his sons, Edward Bond FOOTE, continued in his father's footsteps and wrote his own booklet of contraceptive advice.

Foote was an ardent feminist, and felt a major mission

in his life was to encourage women to believe that they had a right to decide when and how they had families.

VERN L. BULLOUGH

FOOTE, EDWARD BOND (1854–1912), American Malthusian, sex radical, and eugenist. The son of freethinkers Edward Bliss FOOTE and Mary Bond Foote, Edward Bond Foote followed his parents' path to become active in the FREETHOUGHT movement and in medicine. He also followed in his father's footsteps by writing his own book on contraceptive advice, *The Radical Remedy in Social Science; or, Borning Better Babies through Regulating Reproduction by Controlling Contraception.* His brother Hubert managed the Sanitary Bureau established by their father for the distribution of his publications.

Foote was active in the Liberal Club of New York and was made its president in 1888. He described himself as an almost-practicing vegetarian who avoided tobacco and did not drink alcohol. He also said he was a neo-Malthusian who subscribed to EUGENICS and advocated woman suffrage, the sexual emancipation of women, reduced bondage in marriage, and greater freedom in divorce. He held that every child born should be as legitimate in law as it was in nature. As far as religion was concerned, he said he was an AGNOSTIC and a freethinker who looked forward to being cremated when he died and who anticipated nothing further after that.

FOOTE, GEORGE WILLIAM (1850–1915), English freethinker. George William Foote was born in Plymouth on January 11, 1850. His father, a customs officer, died when he was four. He was largely self-educated but became an Anglican, later moving to Unitarianism (see UNITARIANISM TO 1961) and SKEPTICISM. He took up work in a library in London in 1868, demonstrating his abiding love of literature—Percy Bysshe SHELLEY, Lord BYRON, George Meredith, and, above all, William Shakespeare (see SHAKESPEARE, RELIGIOUS SKEPTICISM IN). He started the Young Men's Secular Association to encourage young men to support the FREETHOUGHT cause and also became superintendent of the Hall of Science Sunday School (the hall was an institution for popular education and freethought lectures). He met Charles BRADLAUGH, president of the NATIONAL SECULAR SOCIETY (NSS), and published an article on William Blake in his *National Reformer.* He was attracted to George Jacob HOLYOAKE's more moderate SECULARISM and critical of Bradlaugh's authoritarianism and support for the publication of the birth control pamphlet *The Fruits of Philosophy* by Charles KNOWLTON (see also BIRTH CONTROL AND UNBELIEF).

He joined the rival group the British Secular Union, which was not to demonstrate lasting strength. He launched numerous journals during his life, at this stage originating the *Secularist* (1876–77) and the *Liberal* (1879). In 1881 he started the journal that he would edit for the rest of his life, the *FREETHINKER.* He opened with the forthright statement: "*The Freethinker* is an anti-Christian organ, and must therefore be chiefly aggressive. It will wage relentless war against Superstition in general, and against Christian Superstition in particular." The *Freethinker* included such departments as "Profane Jokes," "Acid Drops" (sharp comments on freethought matters), and "Sugar Plums" (good news for freethinkers). With provocative intentions he published anti-Christian cartoons taken from Léo Taxil's *La Bible Amusante.* Asked why he had become more militant, he cited Charles Bradlaugh's protracted struggle to claim the seat in Parliament he was repeatedly denied because of his ATHEISM.

As he had anticipated, prosecutions came; he was found guilty of BLASPHEMY and imprisoned for a year.

Conditions in jail were hard and his reading matter at first was confined to the Bible. Even prominent Christians thought the sentence was excessive. This experience would fuel Foote's antireligious animus for the rest of his life. A reception awaited him when he left jail on February 25, 1884, and in a few days he was lecturing on the topic "How I Fell among Thieves." Foote promised the judiciary more cartoons—and published them—but there were no more prosecutions.

In 1891, when Bradlaugh was ailing, Foote was elected president of the National Secular Society, but the force of secularism as a cause was spent. Foote wrote: "The heroic period of Freethought is well-nigh over." Many secularists had shifted their energies to socialism. Foote was a Liberal, specifically a supporter of the Liberal Party, one of the main political institutions; in general, he wanted change brought about by individual efforts rather than communal actions, and believed that society operated by individual actions rather than communal ones. Still, he believed that freethought should be neutral in politics. He had debated freethinker and socialist Annie BESANT on the topic "Is Socialism Sound?" Foote found many other topics for the *Freethinker* to cover in the subsequent years: Christian logicality (the study of the illogical nature of arguments for Christianity), secular education (a cause he particularly espoused), Ireland, war, and the "God of Battles."

An important element of his legacy was the founding of the Secular Society Ltd., a charitable organization to which bequests might be given, thus putting the *Freethinker* on a sounder financial basis. Hitherto freethought organizations had been held unable to receive bequests because their aims—presumptively, to promote blasphemy—were illegal. The Bowman case (1915 and 1917) established the right of freethought organizations to receive bequests. Foote brought about other organizational changes, such as the establishment of the publishing firm G. W. Foote and Company. The role of the NSS was sustained by widening the scope of its campaigns, by promoting its public profile, and by gaining support from well-known freethinkers.

Foote also left behind fine writing, in books and pamphlets as well as the journal. It disappointed him that he never wrote the magnum opus on Shakespeare that he wanted to produce. Two series of *Flowers of Freethought* contained many impressive essays. An early essay, "Secularism, The True Philosophy of Life," sets forth the foundation of his whole perspective. He also wrote on the false accusations of deathbed conversions (see DEATHBED CLAIMS CONCERNING UNBELIEVERS), a favorite Foote theme. *The Bible Handbook* (coauthored with W. P. Ball) was a forensic dissection of the Bible, used for many decades until a time when no one in the UK knew enough about the Bible to dissect it.

Foote's friendship with the poet and novelist George Meredith was much valued: in a letter, Meredith told Foote, "You carry on a brave battle, for *the best of causes*," coining a phrase that endured in British freethought circles. Through his editing of the *Freethinker*, his writings, and in his public avowal of the freethought cause, Foote's leadership and literary power sustained freethought for half a century.

JIM HERRICK

FORMAN, JAMES (1928–2005), American civil rights leader and humanist. Born in Chicago, James Forman became interested in desegregation struggles in Little Rock, Arkansas. In 1958 he covered the story for the *Chicago Defender*, one of the most influential newspapers in black America. In 1960 he joined the secular Congress for Racial Equality (CORE). One of his first tasks was to help Tennessee sharecroppers who had been evicted for registering to vote.

In 1961 he joined the Student Nonviolent Coordinating Committee (SNCC), another secular organization. Within a week he became the group's executive secretary. He organized student protests against white supremacy, including dangerous Freedom Rides in order to desegregate buses in the American South. He organized voter registration drives and helped provide bail money for jailed civil rights workers. Forman himself was harassed, beaten, and jailed several times for his efforts.

In 1963 Forman helped organize the historic March on Washington. He and John Lewis—who later became a United States congressman—were primarily responsible for watering down the radical language of some of the civil rights leaders who spoke at the march. As a result, Malcolm X deemed the march "nothing but a circus, with clowns and all," in his famous "Message to the Grassroots" speech.

In 1964 Forman invited thousands of people to join a voter registration drive in Philadelphia, Arkansas. Among the invitees were Andrew Goodman, James Chaney, and Michael Schwerner. The three were murdered in one of the most sensational cases of the civil rights movement.

Though Forman was becoming increasingly militant, the most influential leaders of SNCC thought he was not forceful enough. Eventually, Stokely Carmichael, H. Rap Brown, and other militants had him replaced.

Since the early 1960s Forman had been formulating a plan to demand that white churches pay African Americans $500 million in reparations for their role in the slave trade and black oppression. Forman publicized his demand in 1968 at New York's Riverside Church. Though white churches did not embrace the plan, Riverside agreed to contribute a percentage of its annual income toward efforts to fight poverty.

In his book *The Making of Black Revolutionaries*, Forman discussed his personal path to humanism. While at college, he began to have doubts about God. He learned that matter could not be created or destroyed. He saw much injustice in the world—especially for blacks. He went to ministers with his questions, but they could not provide persuasive answers. Moreover, he grew weary of the calculating church politics to which he was exposed. Eventually, Forman took a philosophy course, and it was just a matter of time before he abandoned his belief in God altogether. He held that theism led to a quietism particularly harmful to black people.

In 1993 African Americans for Humanism presented Forman with an award, and during his acceptance address he reiterated his commitment to humanist ideals. In his later years, Forman led the Unemployment and Poverty Action Committee—yet another secular organization—headquartered in Washington, DC. He continued to fight for social justice until his death in 2005.

NORM R. ALLEN JR.

FRANCE, UNBELIEF IN. Americans are often astonished at the deep secularization of French society. Whereas in the United States a large majority observes the rites of one church or another, fewer than 20 percent among the French do the same—even though Muslims now make up 4 million of France's roughly 60 million people.

But in France as elsewhere, there are different shades of "unbelief" ranging from simple SKEPTICISM of religious dogmas to DEISM, AGNOSTICISM, and outright ATHEISM. And in France the concept of *unbelief* principally connotes unbelief in Roman Catholic dogmas. Under the absolute monarchy, that is until the French Revolution of 1789, France was utterly dominated by the Roman Catholic Church, which controlled every aspect of life for common citizens, nobles, and even the king. The earliest French kings, going back to Clovis I, were crowned under authority of the church—originally in the basilica of Saint-Denis, then for centuries in the Cathedral of Reims. Because of Clovis I's early conversion, France has then and now borne the title of "eldest daughter of the Church."

The Lasting Influence of the Religious Wars. In order to understand the ubiquity of unbelief in France today, one must grasp how this attitude developed as a consequence of France's heritage of quarrels and warfare over religious dogmas—and as a consequence of the humanist reaction against that heritage of conflict.

By way of background, it should be noted that French clergy have long displayed reluctance to bow to the authority of Rome. Perhaps this reflects a nostalgia for the independence of the popes who reigned in Avignon from 1348 to 1417, at first unquestioned in their authority, later competing with the popes of Rome during the "Great Schism." In addition, the rise of Protestantism, especially the sixteenth-century Calvinist Reformation, was well received in several regions of France, principally in the southwest, in Bordeaux and La Rochelle and in the Cévennes in the southeastern part of the Massif Central. Such an avid embrace of Protestantism precipitated violent opposition during the Counter-Reformation. The wars of religion may have been waged more ferociously in France than anywhere else in Europe; they extended over several decades, encompassing the reigns of Charles IX, Henri III, and even Henri IV. One key date was the massacre of Protestants on Saint-Barthélemy (St. Bartholomew's) Day 1572. This was organized by the Italian-born queen mother Catherine de Medicis and her son, the weak king Charles IX. French Protestants, known as Huguenots, were forced into hiding. At the close of this turbulent period, Henri de Navarre, a Protestant, converted to Catholicism in order to reunify France and to affirm his power. Famously he declared *"Paris vaut bien une messe"* (Paris is well worth a mass), taking the throne under the name of Henri IV. Through his famous Edict of Nantes (1598), he returned to French Protestants substantial freedoms.

Throughout this period of conflict, writers and philosophers took skeptical positions with regard to religion. Even before the religious wars, and though he himself was a Catholic priest, François Rabelais sharply mocked religious dogmas and the priests' way of life in his famous *Pantagruel* (1546–64). A still better example is Michel de MONTAIGNE, a Catholic probably of Jewish origin, and definitely a deist. His famous *"Que sais-je?"* (What do I know?) became a motto for the humanists of that time. Often in his *Essais* (1580–95) he defends some "heretical" idea: for example, he offers a brash defense of Julianus the Apostate, the Byzantine emperor who persecuted the state Christianity installed by his predecessor as emperor, Constantine the Great (see CHRISTIANITY, RESISTANCE TO IN THE ANCIENT WORLD).

But Catholic France did not give up. After the death of Henri IV (under the knife of a Catholic fanatic), and under the queen mother Marie de Médicis, the Protestant town of Montauban was sacked; later, forces under the Cardinal de Richelieu, minister of Louis XIII, besieged and defeated the independent Protestant city of La Rochelle, which had formed an alliance with Charles I of England. During the seventeenth century, the Huguenots were but poorly tolerated, and even that tolerance even came to a stop after Louis XIV, the "Sun King," abolished the Edict of Nantes in 1685. He thereafter sought to reimpose Catholicism on all France. The ensuing persecution drove many French Protestants to emigrate to Germany, the Netherlands, or Britain. Some militants tried to resist, such as the Camisards in the Cévennes, but they were cruelly repressed.

Still, among the people something of the old Protestant spirit remained: the feeling that the French should not depend so strictly upon the Roman Catholic Church. There was mild revolt within the French church itself as in the minds of many individuals, most of them not Protestants but freethinkers of some stripe.

The so-called *libertins*—Théophile de Viau, Cyrano de Bergerac, Scarron, and others—expressed mild criticism of dogma, challenged clerical authority, and decried hypocritical intolerance among the priests (see ANTICLERICALISM). Their works were generally published pseudonymously in Holland, yet still they were sometimes punished for expressing these almost heretical ideas (see HERESY).

Gallicanism and Jansenism. Such conflicts also resonated within the church itself. The priest, mathematician, and natural philosopher Marin Mersenne assembled a circle of scholars and priests who began to think boldly about the world and humanity's place within it. Mersenne's friend René DESCARTES proposed a rationalistic, effectively godless philosophy; he was obliged to end his days outside France, dying at the court of Sweden's Queen Christine. Nicolas Malebranche tried to reconcile Cartesian RATIONALISM with church teaching. Even the French government sought some modus vivendi, hoping to coexist with the church rather than live under it. One appealing model was the pre-Reformation Concordat of 1616 between the papacy and the French throne, which had allowed the French church some independence from Rome. The Gallican movement began with a 1682 declaration by the bishop Jacques-Bénigne Bossuet at an extraordinary general assembly of the French clergy. Bossuet declared the king of France independent of Rome in secular matters, adding that even in matters of faith the opinion of the pope is not always infallible. This was accepted by the assembly and, without quite constituting open rebellion against Rome, gave France badly needed breathing room.

In France as elsewhere, Catholic scholars and theologians were divided into monastic or philosophical communities. The often bitter quarrels among them may have further promoted the rise of skepticism. Jansenism, rooted at the abbey of Port-Royal, looked back to the teachings of the church fathers as opposed to the teachings and practices of the powerful Jesuit order. Jansenism gave rise to popular literary works such as the *Provinciales* (1656–57) of Blaise Pascal, a witty but trenchant attack upon the Jesuits and upon what Pascal considered the hypocritical morality of Jesuit conduct in public life. Though Gallicanism and Jansenism had many differences, both movements aimed at securing greater independence of thought with regard to Rome. How much independence? It is worth noting that in his famed *Pensées*, published posthumously, Pascal said of the universe: *"Le silence éternel de ces espaces infinis m'effraie"* (The eternal silence of these infinite spaces frightens me)—hardly the words of someone believing blindly in the Holy Scriptures!

Pierre Bayle. Pierre BAYLE is probably the first French author to present systematic views leading to a reasoned atheism. He was born in 1647, near Toulouse, the son of a minister of the Reformed church. After a short stay at the Reformed academy of Puylaurens in 1669, he converted in 1681 to Catholicism, breaking all links with his family. But no thoughtful son of a Reformed church minister could long accept the authoritarian Jesuit understanding of Catholicism; his return to Protestantism made him a "relapsed heretic" subject to severe penalties, and he left France for Geneva, returning in 1674 under a pseudonym. He became a professor of philosophy at the Protestant academy in Sedan. As repression of Protestantism grew, the Sedan academy was closed in 1681. Bayle moved to Rotterdam, Holland, where he remained for the rest of his life. By then he knew of the writings of Malebranche and of Baruch SPINOZA, the Jewish-Dutch philosopher whose *Ethics Demonstrated in a Geometrical Order* (1677) expressed great skepticism.

Even before the Edict of Nantes was revoked in 1685, Holland hosted a vigorous Huguenot community that included several publishers. Bayle emerged early at the head of an expatriate virtual République des Lettres that forcefully critiqued French Catholicism. Bayle's 1683 attack upon Louis Maimbourg's highly critical history of Calvinism was condemned and burned in Paris in 1683. Together with Henri Desbordes, Bayle published an influential monthly journal, *Nouvelles de la République des Lettres* (News from the Republic of Humanities). Catholic retaliations followed; not until 1696 could Bayle begin publication of his major work, the *Dictionnaire Historique et Critique*, known in English as *Bayle's Dictionary*. This was in many ways a harbinger of the great *Encyclopédie* of Denis DIDEROT and Jean LeRond d'Alembert (see *ENCYCLOPÉDIE, L'*, AND UNBELIEF). The *Dictionary* went through several editions, and it dragged Bayle once more into contention with the church. Bayle died in Rotterdam in 1706. Though his religious attitudes changed several times during his life, he always displayed a critical attitude. In his final years he was still a believer, but also a noncredulous humanist. Let us quote him: "One cannot say anymore that theology is a Queen, of whom philosophy would only be a servant. . . . Even the theologians recognize that any dogma which would not be justified, verified, registered at the supreme parliament of reason and of the light of Nature, cannot aspire to anything but a staggering authority, as fragile as glass."

Voltaire's Deism and Diderot's Atheism. By this time a critical attitude toward Roman influence, especially over French political life, had grown common among educated Frenchmen. This was true even inside the church. Jean MESLIER was a Catholic priest who lost his faith after concluding that the wretched life of French peasants should not be tolerated by a good God (see EVIL, PROBLEM OF). His writings, of which several are lost, presented critical examinations of Catholic dogmas, condemned Christianity's morality of resignation and submission, and defended a rationalist theory of knowledge. Meslier's works were known and much admired

by the philosophers of the Enlightenment (see ENLIGHTENMENT, UNBELIEF DURING THE), but he died in poverty and despair.

The famous and prolific writer VOLTAIRE thought along similar lines, but enjoyed substantially greater influence. He considered Bayle as his spiritual guide:

J'abandonne Platon, je rejette Epicure;
Bayle en sait plus qu'eux tous; je vais le consulter.
La balance à la main, Bayle enseigne le doute,
Assez sage, assez grand, pour être sans système.

I leave alone PLATO, I discard EPICURUS;
Bayle knows more than all of them; I will consult him.
The scales in hand, Bayle teaches doubt
Wise enough, grand enough to be without any system.

Voltaire was certainly no Catholic; it was he who coined the famous motto *"Écrasons l'infâme"* (Let us crash the loathsome thing), speaking of Catholicism and especially its claims to royal power. (In Voltaire the Revolution lay already in sight.) In fact, he was a deist:

L'univers m'embarrasse et je ne puis songer
Que cette horloge existe et n'a point d'horloger.

The universe worries me, and I can't avoid to think
Of that clock existing without a clockmaker.

Denis Diderot, the main author of the *Grande Encyclopédie* (1751–72) and the writer who perhaps best typified the Century of Enlightenment, was definitely an atheist. Let us quote him also: "Nature is not God; . . . Man is not a machine; . . . one hypothesis is not a fact." Like Voltaire, Diderot was subject to judicial persecutions; while Voltaire spent the last part of his life in Ferney with the Swiss border at his back, Diderot languished for many years in the Bastille. Both were fighters for unbelief and for skepticism. But Voltaire, perhaps more than Diderot, was a man of action who compelled the rehabilitation of prominent Frenchmen censured or executed for various slights against the church. Among the best known were Jean Calas, a Protestant of Toulouse tortured to death under false charges that he murdered his son to prevent his converting to Catholicism; Count Lally Tollendal, executed for treason because he surrendered a French colony in India to the British; and the Chevalier de la Barre, condemned for having refused (or forgotten) to bow to a religious procession. Voltaire's personal war against Catholic intolerance made him a hero among the French people.

The French Revolution and the Bonapartist Compromises. Between Voltaire and the coming Revolution, there extends an intriguing historical bridge. As in the past, official France remained reluctant to accept control by Rome. Because of their intrigues on behalf of Roman influence, the Jesuits were partially barred from France in 1764 and wholly forbidden in 1773. In 1778, the atheists the Baron d'HOLBACH, Claude Adrien HELVÉTIUS, and Jérôme de Lalande, all Freemasons, founded at Paris the Lodge of the Nine Sisters (or Nine Muses), a Masonic outpost devoted to profound skepticism. Among its other members were Voltaire, inducted a few months before his death, and also Benjamin FRANKLIN, then American ambassador to France, recruited by Lalande. Lalande remained a popularizer of astronomical knowledge and a fighting atheist until his death in 1807.

Strongly infuenced by the skepticism of Voltaire, by the social romanticism of Jean-Jacques ROUSSEAU, and by the wise political theories of Montesquieu, the French Revolution exploded as a revolt against the absolute power of monarchy—but also, and simultaneously, against the not-so-occult political and social power of the Roman Church.

Before the Revolution, skepticism and atheism had been limited to private circles and generally denied public expression. The Revolution toppled the monarchy, whose fall dragged with it all the traditional institutions of French society. Into this new vacuum could be introduced such radical reforms as democratic structures rooted in the principles defined earlier by Montesquieu: a radical tripartite arrangement in which the executive, the legislature, and the judiciary checked one another's power. The Revolution opened a completely new era throughout society; countless ideas previously hidden and condemned suddenly roared into the light at full strength as though they had always been ruling French society.

The French priesthood suffered terribly from the first years of the Revolution, and much church infrastructure was dismantled. But the Revolution and its aftermath would last only a short time; the church and the papacy observed France patiently, waiting for change. In the event, after a bit more than a quarter century, Rome managed to reconstruct some of its power in France, though never the overwhelming dominance it had enjoyed before the Revolution.

The evolution of the Revolution and the empire is extremely complex. It is during this short period (1789–1815) that we find the roots of the present French fight for *LAÏCITÉ* (laicization, hereafter "laicity," a concept that has much in common with SECULARISM), a fight which in contemporary France is pressed not only by atheists and deists but by many thoughtful Catholics and Protestants as well. Still, broad outlines can be traced by reference to a few key events, notably those concerning religion.

July 14th, 1789: The Fall of the Bastille. This richly symbolic event heralds the launch of the new era.

July 14, 1789–August 10, 1792: The First Period. Constitutional monarchy is in the making. Many priests

actually assume political roles. Religion is reenvisioned as a public service; taxes paid by the people are suspended, and the belongings of the religious are put at the disposal of the public. Priests are encouraged to quit the church and nuns to abandon their convents. Some bishops and many responsible Catholic laypersons favor these changes; remembering the Gallican movement, they see in the new order a promise of escape from the overburdening authority of Rome. Pope Pius VI officially condemns the Declaration of Human Rights in March 1790. Defiantly the Constituent Assembly votes to group all the recent decrees and laws into the "Civil Constitution of the Clergy," which takes effect in June 1790. This completely reorganizes the temporal situation of the church, redefining the relations between church and state and between church and papacy. Priests are no longer subjects of Rome, and must instead swear fidelity to the constitution. Several priests refuse; the king, emboldened by Rome's continuous opposition to the new laws, vetoes a decree against priests who refused to accept the constitution.

This period marks the divorce between the revolution and Catholicism, and sees the rise of a new, almost definitive dichotomy between clerical and anticlerical strains within public opinion.

August 10, 1792–July 27, 1794 (9 Thermidor, year III): The Second Period. The monarchy is abolished, the king is condemned; the hard times take hold. In northern France there is war against Austrian troops. The Terror roils Paris, Lyons, Nantes, and other cities. The Catholic teaching orders, which enjoyed exclusive control of education under absolute monarchy, are dissolved. There is widespread persecution of priests. The Jacobin dictatorship rises.

July 27, 1794–November 9, 1799 (18 Brumaire, year VIII): The Third Period. This is the so-called Thermidorian reaction, the "Directoire." Joseph Lakanal, a former teacher who rose to the National Convention's Committee of Public Instruction, institutes a very strict *laïque* (secularized) system of schooling under the Law of 27 Brumaire, year III (November 17, 1794).

November 9, 1799–1815: The Fourth Period. The "Consulate." Napoléon Bonaparte is named "First Consul" and in 1802 assumes the Consulate for Life. A law prepared by the chemist Antoine-Francois de Fourcroy creates the *lycées* (public high schools). There priests are reinstated as chaplains. Administrative responsibility for primary schooling passes to the towns.

Napoléon was personally indifferent to religion; he was even listed as sympathetic to atheism by Lalande in his first supplement to Sylvain MARÉCHAL's *Dictionary of Atheists* (1800). But in 1801 Napoléon decides it prudent to seek peace with Rome. He signs a new Concordat, which many faithful revolutionary atheists bitterly deplore. Retaliating for this criticism, Napoléon issues a letter that describes atheism as a menace to the moral fiber of the nation and forbids Lalande to speak at the Academy of Sciences.

Napoléon crowns himself Emperor of France in the presence of Pope Pius VII in Paris on December 2, 1804. War follows, but also a normalization of the law and of the school system. The Law of 18 Germinal, year X (April 8, 1802) returns the ownership of religious buildings to the religious authorities. The First Restoration of the monarchy occurs in 1814, marked by the reestablishment of the Jesuits in France; Napoleon attempts to reclaim power (the "Hundred Days," ended at Waterloo), and in 1815 the former emperor is exiled at Saint-Helene. Restored yet again, the new French regime of Louis XVIII almost reclaims the absolutist splendor of the monarchy of Louis XVI.

The Nineteenth Century and through 1905. Though Napoléon had restored the authority of the church, the French people never forgot their former, now-traditional critical view of Roman power. The nineteenth century was marked by an oscillating balance between conservative Catholics and the heirs of the absolute monarchy on the one hand, and skeptical freethinkers of a Voltairean bent and surviving Republicans and revolutionaries on the other. Rightist princes or ministers sometimes held power, including Charles X, Villèle, Guizot, later Napoleon III, and later still Patrice MacMahon. They more or less alternated with more liberal personalities, including Alphonse de Lamartine and François Arago, prominent figures of the Second Republic (1848–52), and later, Léon Gambetta and the atheists Émile Combes and Jean Jaurès, heroes of the Third Republic (1871–1940).

A key event at the close of the nineteenth century put an end to this oscillation of influence. The Dreyfus affair (1894–99) showed the deep division between the two Frances more clearly than anything preceding it. As well, it demonstrated the dangers of such deep division in the face of a strong, victorious, and still quite aggressive Germany, now united after the crushing defeat of France in the Franco-Prussian War (1871).

Alfred Dreyfus, a modest captain of the French army and a Jew, was accused, on the basis of falsified documents, of having communicated secret information to the German government. He was condemned to deportation in a trial that electrified the nation. French society aligned along the fault lines of this controversy, divisions falling often within the same social circles or even within families. The *dreyfusards* coalesced as fighters for human rights; the Ligue des Droits de l'Homme (League for the Rights of Mankind) dates to this period. The *antidreyfusards* created such groups as Ligue de la Patrie Française (League of the French Nation) and the Comité de l'Action Française (Committee for French Action), led by such figures as the anti-Semitic journalist Édouard Drumont and the ardent monarchist and nationalist Charles Maurras. Polarized, France lay near collapse. But *dreyfusard* campaigners including Bernard Lazare, Émile Zola, and Lt. Col. Georges Picquart accumulated

proof that the prosecution had been a plot of the dominant anti-Semitic wing of the army. The Dreyfus affair concluded in 1906 with the rehabilitation of Dreyfus and also of Zola, who had fled to England after being condemned for his violent antiarmy and antigovernment pamphlet *J'accuse* (1898). The Catholic right wing stood ashamed, and for many years was blocked from regaining significant power.

The nature of the dichotomy between the two Frances is reflected in their respective mottos. The ruling liberals claimed as their motto the revolutionary triplet *Liberté, Egalité, Fraternité* (Liberty, Equality, Fraternity), while the disgraced conservatives began to embrace the motto *Travail, Famille, Patrie* (Work, Family, Nation), which would be adopted in 1940 as the official motto of Marshal Pétain's collaborationist Vichy regime during the Nazi occupation of France. It is further noteworthy that the word *liberté* (freedom or liberty) was sufficiently ambiguous to be usable by both camps. The leftists associated it with solidarity, the freedom of some being duly limited by the need to protect the freedom of others. The rightists associated it with the freedom to introduce religion in the schools and to develop capitalism and "free" enterprise. This often meant "freedom" at the expense of others, but why should the powerful care?

The Third Republic and Laïcity. The year 1905 saw transforming change in the wake of the Dreyfus affair. The minister Jules Ferry had already managed to pass a law excluding religion from public schools; this is the most definite imposition of the concept of laïcity into French law. Some Catholic leftist movements already existed by 1905; Catholic thinkers who had recognized negative aspects of church power even before the Dreyfus affair included Marc Sangnier, whose *Sillon* (Furrow) movement of 1894 was condemned by Pope Pius X; and the Catholic *dreyfusard* writer Charles Péguy, who launched an influential magazine, *Cahiers de la Quinzaine* (Fortnightly Review), in 1899. These were the ancestors of France's modern "Christian Democrats." Their emergence marked the dawn of an era in which religious belief was no longer exclusively associated with the political right.

Yet divisions remain. In France religious private schools are famously termed *école libre* (free school) by the Catholics who use them, but *école confessionnelle* (confessional school) or, more generally, *école privée* (private school) by nonbelievers—though some private schools are nonreligious. Yet Catholics of the political left, firmly attached to the principle of laïcity, resolutely sent their children to public schools throughout the twentieth century. This tendency diminished with the dawn of the twenty-first century, and it is paradoxical that young Muslim girls who want to wear the veil, now forbidden in French public schools, are accepted by Catholic schools. Meanwhile the political right is by no means monolithically religious; many on the right are non-Catholics rooted in the anticlerical tradition.

The events of 1905 ushered in a reorganization that cemented a new view of the status of religion in French society, but more specifically—and quite precisely—redefined the status of religion in French schooling. It is during this period that the French philosophy of *laïcité* (laïcity, desacralization, or secularism) was frozen in. Out of this philosophy emerged the 2004 French law that bars the wearing of the Muslim veil, indeed any obvious trapping bespeaking religious commitment, in public schools.

***Laïque*, *Laïc*, and *Laïcité*.** At this point it is imperative to define three French words whose meaning is often elusive in English: *laïque* and *laïc*—two quite different words, both of which can be used either as nouns or as adjectives—and the noun *laïcité*.

Laïc is a term of canon law, referring to persons who are faithful Catholics but have not received the sacrament of ordination. In other words, they are not members of the religious—priests or nuns—but rather belong to the laity. *Laïc* is the characteristic of belonging to the laity, of being a lay person.

Laïque—and the noun *laïcité*, which designates the status of being *laïque*—has a broader connotation. It labels an object or person that is independent from any religious doctrine. One can say that "*la France est une République laïque*," that is, independent from any religion. Ideas that are thought of today as *laïques* were already mentioned as such by Montaigne in the sixteenth century.

Article 2 of the present French Constitution says clearly: "France is a indivisible, *laïque*, democratic and social Republic." The roots of this sentence are of course to be found in the Enlightenment and in the French Revolution. But over the years it has been formalized with progressively greater precision, especially as regards the schools. The reasons have to do with the principles that guide French public education. Laws dating to the 1880s state that schooling must be provided for all children free of charge, and make primary education compulsory for children aged six through fourteen regardless of gender or French citizenship. As the public school is free and open to all, it must in return insist that no sign of religious membership or distinction between children on grounds of belief be displayed. Two other laws of the 1880s bar priests from the teaching staff of public schools, specifically repealing an 1850 law that had given priests some powers to review public schools. It was further recognized that children are entitled to receive some religious education; a fifth law from the 1880s created a five-day school week, freeing up one day in addition to Sunday on which parents could obtain religious education for their children outside of public schools. Though the schools do not provide religious education, they can and do provide moral and civic education, and are in fact required to do so.

The idea of formal *laïcité* originated with the Third Republic, which began in 1871 and which applied *laïcité*

to all domains of social life. In 1881 the religious character of cemeteries was abolished; nonreligious burials were authorized in 1887. Divorce was legalized in 1884. Public prayers at, for example, the opening of parliamentary sessions were abolished in 1884. Over many years the public hospitals, previously largely controlled by religious orders, became laïcized. Years later, a 1972 law did away with oaths sworn to God at the beginning of court proceedings. Any mention of God has been eliminated from official statements, laws, and rules.

Of greater importance than all of these is the Law of December 9, 1905, largely the work of the socialist Jean Jaurès, which mandates complete separation between church and state. It opens with a statement that the republic guarantees freedom of conscience and free exercise of religion. It states that all buildings used for the exercise of religion are the property of the state, and of local authorities (cities or departments), placed at the free disposal of religious authorities organized in legally recognized associations.

The *laïques* laws of the 1880s and especially the law of 1905 were unmistakably intended to institute permanent reform. Lawmaking ever since has generally moved in the direction of further clarifying and expanding the idea of *laïcité*. But the Catholic church remains ill-disposed toward laïcization, and has pressed for laws that strengthen its political position whenever public opinion leans toward greater conservatism. So in 1959 the Debré law was passed to create a class of private religious schools operating under contract with the state. The Lang-Cloupet agreements of 1993 extend public support for the education of private school teachers.

Unbelief in France at the Dawn of the Twenty-first Century. In its attitudes with respect to religion, contemporary French society of course fully reflects the rich and sometimes contradictory history that this article has briefly sketched. Present-day France is undoubtedly composed mostly of titular Catholics, who very rarely attend Sunday services, but still marry and baptize their children according to traditional rites. The smaller population of Protestants, mostly Calvinists, tends to be somewhat more observant than Catholics, perhaps reflecting its minority status. Among French Jews, very few observe the full strictness of Orthodox practice. Meanwhile French Muslims display the highest levels of ritual observance and ardent belief of any faith community in France. Cultural factors may be in play, including feelings of rejection or exclusion from French social life on the part of Muslims, who as a group constitute France's most recent immigrants.

But neither denominational affiliation nor the intensity of ritual observance tells the full story. If an opinion poll were conducted today to examine where the French stand regarding religious matters, a large majority—even among titular Catholics—would almost certainly identify themselves as deists or agnostics. A substantial number would admit to atheism, though only few participate in any organized atheist association. Even among the strictly observant, a sharp dichotomy could be expected to appear between believers who nevertheless examine critically the dogmas of their own faith communities, and a smaller number who credulously accept any teaching, any "miracle" (see MIRACLES, UNBELIEF IN), or any holy manifestation. These are more than believers; we might describe them as "the credulous." In marked contrast to them are the "unbelievers," the "incredulous" (in French, *incroyants* or *incrédules*). They are outspokenly skeptical of written scripture and the dogmas taught by the various churches. In particular, they apply an anticlerical skepticism toward the teachings devised and proclaimed by the successive popes of the Roman Catholic Church.

This skepticism is based on a critical appraisal of religious dogmas, and upon the unbeliever's recognition of the genuine "impossibility" of believing in them. This is the basis of modern unbelief in France. Though its origins are essentially social and political in character (as shown above), its deeper justification lies with a critical, rational approach toward unproven and unprovable dogmas of every kind. In France today few indeed accept the virginity of Mary or the official Catholic position on the Eucharist, which still holds that God is literally transsubstantiated into bread and wine. Few fail to accept the evolution of species, or of the universe itself over eons of time. Few entertain any spirituality or anthropomorphism in their view of the cosmos. French society has indeed made the minds of the French generally rationalistic, and there seems no reason anymore to believe in the old dogmas.

Organizations of Unbelievers. In view of the great prevalence of what we might call *practical* unbelief, it is astonishing to recognize that unbelievers in France are but poorly organized, belonging in modest numbers to small, separate groups such as the LIBRE PENSÉE, the Union des Athées, and the UNION RATIONALISTE. As for Freemasonry, its popularity is declining and it is difficult to say to what degree it still attracts deists or atheists as once it did. Unbelievers are by nature independent thinkers, and the strong individualism encouraged by French society further disinclines them toward identifying with any "community," even a community of freethought. And so organized unbelief remains fragmented and weak, despite the pervasiveness of unbelief throughout French life. On the other hand, religious affiliation and participation are undergoing a revival. This can be seen in Catholic and Jewish circles as well as in the fast-growing number of mosques. Pandering to this trend, in 2004 some French politicians advocated "softening" the secularizing laws of the 1880s and 1905. This is considered a serious danger among French freethinkers. Another worrisome trend is the postmodern tendency to view the achievements of modern science and technology, biology in particular, with alarm or even revulsion. Such thinking necessarily implies a disaffec-

tion from rationalism which might modify popular attitudes—especially when the political strength of the church, at least in France, is strongly weakened, and no longer perceived by most as a danger.

JEAN-CLAUDE PECKER

FRANKLIN, BENJAMIN (1706–1790), American printer, editor, and author, was also a prolific inventor (of bifocals, lightning rod, a stove, and the water-harmonica), and scientist (studied electricity and the Gulf Stream). He was also a philosopher, ethicist, Freemason, politician, statesman, diplomat, abolitionist, opponent of dueling, defender of Indian rights, educator, educational reformer, and civil libertarian, and the founder of a subscription library, a fire company, a militia, and a philosophical society.

Among Benjamin Franklin's many signal accomplishments, he served as governor of Pennsylvania, founded the University of Pennsylvania, and influenced Thomas PAINE to move to America. He recruited the Marquis de Lafayette and Baron von Steuben to assist the American revolutionary cause. He was a leading delegate to the Continental Congress and helped to write the Articles of Confederation, the first US Constitution. As a diplomat he negotiated the all-important military treaty with France in 1778 and was the main architect of the final Treaty of Paris in 1783 that formally ended the American Revolution. He helped Thomas JEFFERSON produce the Declaration of Independence and helped draft the Constitution in 1787. The following year he wrote that at the age of twenty-five, he had come up with the idea of a "United Nations" organization.

Franklin and Religion. Though raised as a Presbyterian, at an early age Franklin became a deist (see DEISM) and freethinker (see FREETHOUGHT) after the eighteenth-century manner. He never joined a church and seldom attended "public worship." In the last year of his life Franklin defined his deism in this way in a letter to Dr. Ezra Stiles, president of Yale College: "I believe in one God, the creator of the universe; that he governs it by his Providence; that he ought to be worshipped; that the most acceptable service we can render to him is doing good to his other children; that the soul of man is immortal, and will be treated with justice in another life respecting its conduct in this. These I take to be the fundamental points of all sound religion, and I regard them as you do, in whatever sect I meet with them." These views are remarkably similar to those expressed a mere four years later by Paine in *The Age of Reason*.

Elsewhere Franklin implicitly criticized traditional religion this way: "I wish it [Christianity] were more productive of good works. . . . I mean real good works . . . not holy-day keeping, sermon hearing . . . or making long prayers, filled with flatteries and compliments despised by wise men, and much less capable of pleasing the Deity." He added in the same letter that "[a]s to Jesus of Nazareth, my opinion of whom you particularly desire, I think his system of morals and his religion, as he left them to us, the best the world ever saw, or is like to see; but I apprehend it has received various corrupting changes, and I have, with most of the present dissenters in England, some doubts as to his divinity; though it is a question I do not dogmatize upon, having never studied it." These views are quite similar to those of Jefferson.

On other occasions Franklin had this to say about religion: "Revelation, indeed, as such, had no influence on my mind." "Lighthouses are more helpful than churches." "The way to see by faith is to shut the eye of reason." "The [constitutional convention of 1787] except for three or four persons, thought that prayers [at the convention] unnecessary."

Clearly, Franklin was not an orthodox Christian. Consummate politician that he was, however, he went out of his way to get along with people of every variety of religion. In a 1772 letter to a British newspaper defending religious dissenters, he wrote: "If we look back into history for the character of present sects in Christianity, we shall find few have not in their turns been persecutors, and complainers of persecution. The primitive Christians thought persecution extremely wrong in the Pagans, but practiced it on one another. The first Protestants of the Church of England, blamed persecution in the Roman church, but practiced it against the Puritans: these found it wrong in the Bishops, but fell into the same practice themselves both here [England] and in New England." As Franklin put it, "every sect believing itself possessed of all truth, and that every tenet differing from theirs is error." Some believed it their "duty" to persecute "HERESY."

In this vein, as early as 1738 Franklin wrote that "I think vital religion has always suffered when orthodoxy is more regarded than virtue. The scriptures assure me that at the last day we shall not be examined on what we thought but on what we did."

Franklin went on to write that "[b]y degrees more moderate and more modest sentiments have taken place in the Christian world; and among Protestants particularly all disclaim persecution, none vindicate it, and few [practice] it. We should then cease to reproach each other with what was done by our ancestors, but judge the present character of sects or churches by their present conduct only." As historian Gregory Schaaf puts it, "This was easier said than done, but he deserves credit for attempting to moderate the situation."

Elsewhere Franklin wrote, "I respected [every religion], [though] with different degrees of respect, as I have found them more or less [mixed] with other articles, which, without any tendency to inspire, promote, or confirm morality, [served] principally to divide us, and make us unfriendly to one another. This respect to all, with the opinion that the worst had some good effects, [induced] me to avoid all discourse that might tend to lessen the good opinion another might have of his own religion; and as our province [increased] in people, and new places of

worship were continually wanted, and generally erected by voluntary contributions, my mite for such purposes, whatever might be the sect, was never refused."

However, as Anson Phelps Stokes and Leo Pfeffer point out, Franklin had a high opinion of the Baptists because they had no formal creed. (Franklin would have to revise this view today in view of the fundamentalist takeover of the machinery of the Southern Baptist Convention.)

Finally, Franklin, who, like Jefferson and Paine, could be thought of as a sort of "proto-humanist" (see HUMANISM), articulated a view common among many religious progressives today: "Serving God is doing good to man, but praying is thought an easier service and therefore is more generally chosen."

Franklin and Church-State Issues. Though he had less to say about religious liberty and church-state separation than his colleagues Jefferson and James MADISON, Franklin was unquestionably in harmony with their views. In 1780 he wrote the following to a Quaker friend, Richard Price:

> I am fully of your opinion respecting religious tests [for public office]. . . if we consider what that people were 100 years ago, we must allow they have gone great lengths in liberality of sentiment on religious subjects. . . . If Christian preachers had continued to teach as Christ and his Apostles did, without salaries, and as the Quakers now do, I imagine tests would never have existed; for I think they were invented, not so much to secure religion itself, as the emoluments [profits] of it. When a religion is good, I conceive that it will support itself; and, when it cannot support itself, and God does not care to support [it], so that its professors are obliged to call for the help of the civil power, it is a sign, I apprehend, of its being a bad one.

Thus in one short paragraph Franklin anticipated the ban on religious tests in Article VI of the Constitution, the First Amendment principle of separation of church and state as Jefferson and Madison understood it, and the US Supreme Court's magnificent explanation of that principle in the 1947 *Everson* and subsequent rulings.

Norman Cousins ends his selection of Franklin quotes with this: "God grant that not only the Love of Liberty but a thorough knowledge of the rights of man [a book title used by Paine shortly after Franklin's death] may pervade all the nations of the earth, so that a philosopher might set his feet anywhere on its surface and say, 'This is my country.'"

***FREE ENQUIRER*, THE.** A significant US FREETHOUGHT periodical of the early-to-middle nineteenth century, the *Free Enquirer* began as the *New-Harmony Gazette*, house organ of the utopian colony at New Harmony, Indiana, founded by British industrialist and social reformer Robert OWEN and led by his son, Robert Dale OWEN. Coedited by the younger Owen and Frances WRIGHT, prominent American abolitionist, feminist, atheist (see ATHEISM), and reformer, the *Gazette* was published from October 1, 1825, to October 22, 1828. Dissatisfied with the Indiana colony's performance and seeking greater prominence in American thought, Owen and Wright retitled the paper the *New-Harmony Gazette or Free Enquirer* until February 25, 1829. They then relocated to New York and adopted the title the *Free Enquirer.*

For three years Owen was the paper's leading force. The *Free Inquirer* focused not only on atheism or freethought (then often called "infidelity") but also labor and social reform. According to historian Albert Post, the paper gave voice to "the most radical demands of the politically conscious workingmen. . . . [I]n fact, the *Free Enquirer* was an important factor in the creation of the laboring class's ideology" (see LABOR MOVEMENT AND UNBELIEF). Also advocated were unfettered inquiry on all subjects, religion included; abolition of debtor's prisons and capital punishment; equality for women; and the right to testify in court without swearing an oath.

Owen's coeditors were Wright and briefly Robert L. Jennings, a former Universalist minister (see UNIVERSALISM TO 1961) turned atheist. At its peak the *Free Enquirer* had one thousand subscribers.

In October 1829 Wright left the paper, sailing with Owenite reformer William Phiquepal and a shipload of slaves, residents of her failed abolitionist colony of Nashoba, Tennessee, whom she intended to set free in Haiti. Wright and Phiquepal had a daughter together, subsequently entering into a doomed marriage that would remove Wright from public life. Owen edited the *Free Enquirer* until May 1832. After his unconventional marriage with Mary Jane Robinson (see RITUAL, CERE-

MONIAL, AND UNBELIEF), he returned briefly to Europe and put the *Free Enquirer* behind him.

Reluctantly succeeding Owen was Amos Gilbert, a radical Quaker who found criticism of religion unedifying. Circulation plummeted and Gilbert retired after five months. For two months the paper was published by Benjamin H. Day, who later founded the *New York Sun*; Day was succeeded by H. D. Robinson, a combative English printer who advocated strident atheism and a bellicose ANTICLERICALISM. This alienated freethinkers of a deistic bent (see DEISM), notably Gilbert VALE. The *Free Enquirer* declined steadily, publishing its final issue on June 28, 1835.

Though short-lived, the *Free Enquirer* was significant not only for its content during the Owen years, but also for publishing innovations that would become staples of the freethought press (see PERIODICALS OF UNBELIEF). As early as the New-Harmony period, Owen and Wright broke new ground by publishing extracts from then-classic freethought works. Later these extracts were gathered into books, arguably the first products of a dedicated US freethought press. Titles included works by Wright and Owen, Thomas PAINE, Baron d'HOLBACH, and Percy Bysshe SHELLEY. Augustus Matsell, an assistant to Owen at the *Free Enquirer*, later opened a pioneer "liberal bookstore" and published an even broader line of reprints. Even the incendiary H. D. Robinson translated several d'Holbach works into English and issued a series of freethought titles under the New York Philosophical Library imprint.

While Kneeland's *BOSTON INVESTIGATOR* enjoyed a longer life (1831–1904), the *Free Enquirer* enjoyed great influence during its heyday. In particular it helped forge ties with a spectrum of radical reform movements that would influence nineteenth- and early twentieth-century freethought (see WOMAN SUFFRAGE MOVEMENT AND UNBELIEF; SEX RADICALISM AND UNBELIEF; ANARCHISM AND UNBELIEF).

In 1980, when Paul Kurtz, Gordon STEIN, and others founded the Council for Democratic and Secular Humanism (now the Council for Secular Humanism), its magazine was named *Free Inquiry* in partial tribute to the heritage of the *Free Enquirer*.

FRENCH LITERATURE, UNBELIEF IN. See **FRANCE, UNBELIEF IN.**

FRENCH REVOLUTION. See **FRANCE, UNBELIEF IN.**

FREETHINKER, THE. The longest-running British freethought journal, the *Freethinker* was founded in 1881 and is still published monthly. G. W. FOOTE started the monthly journal in May 1881, and it became a weekly in September of that year (reverting to a monthly only in 1973 for economic reasons). It was avowedly anti-Christian from the start. Foote, whose instincts were literary and genteel, had been persuaded by the furor of Charles BRADLAUGH's struggle to enter Parliament to produce an aggressive organ of advocacy. It aimed to employ "any weapons of ridicule or sarcasm that may be borrowed from the armoury of Common Sense."

Satirical accounts of religious meetings, for instance, those of the evangelists Dwight Lyman Moody and Ira David Sankey, were accompanied by exposure of the contradictions of theological thought and biblical texts. Foote believed that a detailed knowledge of scripture was invaluable in the criticism of Christianity. Two regular features were "Acid Drops," sarcastic comments on religious matters, and "Sugar Plums," notes about advances of secularism.

Foote was determined to wage war with all the tools of journalism, including antireligious cartoons. A series of cartoons based on biblical stories was introduced, many of them coming from the Frenchman Léo Taxil's *La Bible Amusante*. Foote was provoking prosecution, and it came in 1882, in connection with two cartoons from the *Freethinker*'s Christmas issue of 1882. One, titled "Moses Getting a Back View," was a picture of the backside of the deity. Another, captioned "Divine Illumination," showed an old man lighting his pipe.

Foote; his manager W. J. Ramsey; and printer Henry Kemp were prosecuted and tried before Lord North, a bigoted Catholic judge. After an inconclusive outcome a retrial was held at which Foote, despite making a stirring speech in his defense, was found guilty. He was sentenced to twelve months' imprisonment; Ramsey was given six months and Kemp three months. Foote said in reaction to the harsh sentence: "I thank you, my lord, it is worthy of your creed."

Even opponents were shocked by the severity of the punishment, and a public outcry followed. Edward Bibbins AVELING took over editorship of the journal, bringing in more coverage of social injustice and women's rights.

A third trial took place while Foote was jailed. The new judge, Lord Coleridge, was a more reasonable man who had established precedents about BLASPHEMY law—for instance, that there was a difference between blasphemy and indecency. The case was withdrawn, but Foote continued in jail until his release to acclaim from his freethinking supporters. Foote promised more provocation but there were no more prosecutions.

Foote resumed the editorship, which he retained until his death in 1915. There were serious financial difficulties during this period and Foote had problems keeping

the *Freethinker* going. He established the legal right for bequests to be made to irreligious organizations with a case upholding the legality of a bequest.

Chapman COHEN, who had assisted Foote in producing the *Freethinker* for many years, took over the editorship in 1915 and held the post until 1951. Cohen was particularly good at presenting philosophical ideas to readers, although the journal's emphasis upon countertheology did not weaken. Free speech, divorce reform, birth control (see BIRTH CONTROL AND UNBELIEF), blasphemy law, the powers of the BBC, and the ever-present contradictions of clerics and theologians continued through the twentieth century. During World War I, Bertrand RUSSELL wrote a long letter on the topic of conscientious objection. World War II brought objection to days of prayer and Bibles for the forces. The *Freethinker* offices were bombed during the Blitz—fortunately, an emergency issue had been prepared to prevent a gap in publication.

After Cohen's resignation a succession of editors included F. A. Ridley, David Tribe, Nigel Sinnott, Bill McIlroy, Jim Herrick, Peter Breary, and Barry Duke. The *Freethinker*'s robust criticism of religion remains forceful and heartfelt.

A publication by the same name was issued in the United States by atheist activist Joseph LEWIS from the middle of the 1940s until its name was changed in the 1950s.

FREETHOUGHT. Literally the questioning of received opinion and traditional customs, *freethought* has come to mean arrival at and acting upon heterodox views, especially in religious matters. The freethinking editor Gordon STEIN declared that simple unbelief should be called *free thought* and the term *freethought* applied only to the movement with a tradition and philosophical base embracing the use of reason and ethics and the elimination of superstition of all kinds. Obviously, heterodox views cannot be known unless expressed orally or in writing, or by actions such as abandoning churchgoing, but it takes some time for their exponents to be properly called a movement. In naming freethinkers in histories and biographical dictionaries, compilers usually adopt a relative standard: that is, the degree of heterodoxy detected is inversely proportional to the power of orthodoxy in the freethinker's environment. As this judgment is largely subjective, such works may attract criticism from skeptical reviewers who question whether non-Christian theists, deists, and reverent agnostics should be included.

Deism. In fact, *freethought* was originally deemed synonymous with *DEISM*. Its evolution in Europe, including Britain, is outlined in James Mackinnon ROBERTSON'S *History of Freethought Ancient and Modern to the Period of the French Revolution* (1936). According to Robertson, a pantheistic, antinomian sect called Brethren of the Free Spirit flourished in France and Italy between the thirteenth and fifteenth centuries. Following Saint Paul, antinomians asserted that Christ had freed them from the Mosaic law, including the moral law. They claimed to live virtuously without it, while enemies accused them of using their doctrine as an excuse for licentiousness. French names for a freethinker recorded in Pierre BAYLE'S *Dictionnaire* (1697) and elsewhere were *bel esprit* (beautiful spirit), *esprit fort* (bold spirit), and *libertin* (libertine), with greater ambiguity then than today. In its sixth edition (1820), the *Encyclopedia Britannica* said that the name "freethinker . . . seems to have been first assumed as the denomination of a party about the middle of the sixteenth century, by some gentlemen in France and Italy" wishing to disguise their anti-Christianity. (The latest, fifteenth edition of 1974 curiously has no corresponding entry.) Robertson identified their label as "deist." Certainly by the late seventeenth century both terms were used interchangeably. Previously unbelievers had been called "atheists," "infidels," or "rationalists." The *Oxford English Dictionary* names the first recorded use of "freethinker" in England as the title of S. Smith's 1692 booklet *The Religious Impostor . . . dedicated to Doctor S-lm-n and the rest of the new Religious Fraternity of Freethinkers near Leather-Sellers-Hall . . . printed in the first year of Grace and Freethinking.* Ever controversial, Robertson said this sect was really the less heretical "Freeseekers," and that the first recorded use of "freethinker" in English occurred in 1695 when, in a letter of December 24 to the empiricist John LOCKE, William Molyneux called John TOLAND a "candid freethinker."

Though leading French Encyclopedists admitted to ATHEISM (see *ENCYCLOPÉDIE, L'*, AND UNBELIEF), the great bulk of Continental, British, and American freethinkers of the eighteenth and early nineteenth centuries called themselves deists. Thomas PAINE is believed to have wanted to set up deistic churches, and one or two were independently established. On March 28, 1823, however, one of Paine's publishers, the imprisoned editor of the influential English *Republican*, Richard CARLILE, announced that he had turned from deism to atheism. While there were few other public conversions, the label "deist" rapidly disappeared thereafter. This was not the case with "freethinker."

The distinction between deism and atheism is largely one of convention, as both reject theism. Yet both deists and theists have some pretensions to piety, since the words are derived respectively from the Latin and Greek for "god." By general usage, however, the deity of theism is the biblical creator and sustainer of the universe, the entity that watches sparrows fall to the ground and answers—or declines to answer—human prayers. With discovery of the laws of physics and chemistry (notably planetary motion, gravity, thermodynamics, and conservation of matter and energy) and theories of evolution and relativity, it was no longer possible to accept theism by other than blind faith. Yet for centuries it was unsafe, and even today in the United States and elsewhere unsavory, to declare oneself an atheist, even though the term literally means "without" and not "against" god. So unbelievers adopted the deist label. In England this was sourced to *De Veritate* (1624) by Edward Herbert of Cherbury. Originally the expression denoted rejection of revelation, biblical or personal, in favor of so-called natural religion, which posited that nature itself testified to the existence of a deity; it later came to signify belief in a god that had created the world then left it to its own devices. Essentially this was the god of Thomas Aquinas's "five proofs" in *Summa Theologiae* (1265–73) that was disproved by Immanuel KANT in *Critique of Pure Reason* (1781) (see EXISTENCE OF GOD, ARGUMENTS FOR AND AGAINST). Such a god involved logical absurdities including the notion of the "uncaused cause," needless complexity in defiance of Occam's razor, and hypotheses not amenable to the verification principle (see VERIFICATIONISM). Religious apologists asserted that if these assumptions could not be proved scientifically, they equally could not be disproved.

Beyond Deism. In a twentieth-century riposte, Karl POPPER conclusively showed that any proposition that can never be falsified is not true but meaningless (see LOGICAL POSITIVISM). Yet the real reason for abandoning deism was probably that it was, like Dean Arthur Stanley's Broad Church, "not worth believing in." Not everyone who abandoned deism turned to atheism. Some chose SKEPTICISM or AGNOSTICISM; others, more affirmatively, opted for SECULARISM, Liberalism, eclecticism, ETHICAL CULTURE, RATIONALISM, or HUMANISM. But underlying them all was freethought. Before those other labels became fashionable, "freethought" or "freethinkers" was included in the titles of sundry bodies of unbelievers round the world: in Amsterdam (1855); Dunedin, New Zealand (1878); France (1879); Canterbury, Wellington, and Auckland, New Zealand (1918); France and Germany (1919); Sydney University (1930); Poland (1934). It also featured in the name of the first international body of unbelievers, the International Federation (after 1936, World Union) of Freethinkers (1880).
